In walking and driving over the valley, one's feelings of awe at the unspoilable monuments of nature are often marred by the intrusion of the work of unskillful hands upon the foreground of the picture. The importance of the foreground is increased by the narrowness of the gorge and the multiplicity of grand views in every direction, which are enhanced by agreeable foregrounds. In several conspicuous places are fields of rank ferns thickly dotted with stumps — once, according to photographs and the work of disinterested witnesses, spots of singular beauty. Many acres were thus transformed, fenced in and converted into hay-fields and leased to a transportation company, to the exclusion of the public; and though the removal of these fences has wisely been ordered by the commission, nature must be long in repairing the damage already done by the trampling of pasturing animals. Near the Yosemite Fall an unnecessary swath has been cut through the forest, to the sacrifice of some of the noblest oaks in the valley, the boles of which lie where they were felled. The object of this is represented to have been to open a vista from the bar-room of Barnard's Hotel, to rival the natural view of the same fall from the Stoneman House. Indeed much cutting of trees seems to have been done to open up artificial vistas, especially by trimming off the lower limbs of young conifers to one-third or one-half their height. It is idle to say that no trees should be cut in the Yosemite, but it is well known that the cutting of a tree is one of the most delicate operations of the landscape artist, and one does not have to look twice to see that in the valley the cutting has not been guided by expert advice. How much more the need of intelligence and skill when whole vistas are to be opened, and especially when the effect of the grandest scenery is part of the problem. In a number of places where thickets had been trimmed up I saw piles of dry branches lying under the deformed trees, thus exposing the valley to the danger of fire — a more remarkable sight since in general the commission seems to be fully alive to the danger of injury to the valley by fire.

The visitor to the Yosemite finds much to praise in the arrangements for reaching the points of interest. The trails are uniformly good; the guides, so far as I could learn, are sober, careful, and intelligent; the horses and mules are trustworthy for mountain work. One may not be wanting in appreciation of these and other excellent features of the valley management and still feel, from the evidence of his eyes, that in failing to enlist expert assistance the present commission and all previous commissions have exposed to serious danger the trust which they have in charge not only for themselves and for California, but for the world of to-day and of all time to come.

Columbus's Day.

NEARLY 400 years ago, on May 20, 1506, Spain permitted the world's most illustrious sailor to die in poverty and disgrace. Some 300 years later a Frenchman erected at Baltimore a neglected and almost forgotten monument to Columbus. In Roman Catholic circles there is now a serious proposition to honor the daring navigator by canonizing him into St. Christopher. Taking all together can any generous citizen of the three Americas think that the discoverer who suffered so much has yet been fitly rewarded?

The fair of 1892 will in itself be a magnificent but fleeting tribute. A monument would be lasting, but with so many unfinished monuments who would dare suggest another? Or by what right should the discoverer of a hemisphere be limited to a statue not visible a mile away, or by the merest fraction of the people to whose grateful memory he has a title? In this dilemma is not this a fitting time to urge the proposal that the day of the discovery should be dedicated to the discoverer? It is so fitly timed, by good fortune, with reference to other holidays of the year that it lends itself to the proposal as though so intended. Between the Fourth of July and Thanksgiving comes only Labor Day. And after Thanksgiving there is no break in the work-days until the two crowded holidays of the New Year season. The half-way holiday of Thanksgiving comes, when it does, in tardy, bleak November, too long after the Fourth and too shortly before Christmas, purely by accident. It is a holiday too firmly fixed in the people's affections for any one to wish or dare to propose its discontinuance. But surely a suggestion to shift it a little in the calendar, to a more genial season, at a time when a holiday is missing, and moreover to add to it a new and deeper meaning, is only to propose a most friendly purpose. It would be sheer caviling to object that already there is one holiday dedicated to honoring the birthday of the father of our country. No one would do him the less honor by honoring Columbus, not only in this great nation but throughout the American hemisphere. Putting religious festivals aside, there would be no holiday to compare with it, just as, since the world began, there has been no material event of greater significance to civilized mankind than the discovery of the New World.

Of course this could not be achieved all at once. Thanksgiving Day, like Topsy, "grewed." It was the result of coöperation by the sundry governors, growing out of the obvious fitness of things. Similarly, to create the new holiday only coöperation is necessary. Legislation would be useful, of course; but in New York at least, and probably elsewhere, the wording of the present statutes is sufficient. "Any day appointed or recommended by the governor of this State, or the President of the United States, as a day of thanksgiving" is a legal holiday in New York. What better day for Thanksgiving could be named than October 12, and what especial reason is there for retaining Thanksgiving in inconvenient November simply because chance and custom have placed it there? Let us by all means keep the honored feast-day, and better yet let us give it new worth and luster. Let New York's governor

set the example, let the President follow it in the great quadro-centennial year, and then poor Christopher will no longer be unhonored in the country upon whose grateful memory he has so especial a claim. Just as the Eiffel tower survives the Paris exposition, so let us hope a new and significant holiday may survive our fair of 1892. The daily press teems with elaborate suggestions for curious and costly structures of stone and metal. But none of them are so fit a memorial or would be so dear to the people as an annually recurring feast-day.

Edward A. Bradford.

"Shooting into Libby Prison."

I WAS surprised at the denial of shooting into Libby Prison, on page 153 of the November CENTURY, because I was so unfortunate as to be compelled to stay a short time at that notorious place and had a personal experience with the shooting. Our squad reached the prison one April night in 1863. Early next morning we new arrivals, anxious to become better acquainted with the rebel capital, filled the windows and with outstretched necks sniffed the fresh air. Three of my comrades were kneeling with elbows resting on the window-sill, quietly looking out. I stood with my hand on the top of a window-frame, looking out over their heads, when bang went a gun, and a bullet came whizzing close to my head and sunk deep into the casing within six inches of my hand. Nothing saved one of our number from death but the poor aim of the guard, who was nearly under us, and to whom we were paying no attention. We were told by those who had been there some time that it was the habit of the guard to shoot in that way to keep prisoners from leaning out of the windows.

Albert H. Hollister,

*Company F, 22d Wisconsin; 1st Lieutenant, Co. K,
30th United States Colored Troops.*

I ENTERED Libby a prisoner of war, October 10, 1863, much weakened by our long trip in box cars from Chattanooga, and having been forty-eight hours without rations. To escape the stifling air inside I seated myself in an open window on the second floor. One of my comrades, having more experience, made a grab for me and "yanked" me out, exclaiming, "My God, man, do you want to die?" "What's up now?" I said. "Look there!" Peeping over the window-sill, I saw the guard just removing his gun from his shoulder. "What does this mean?" I said. "We had no orders about the windows." "That is the kind of orders we get here," he answered. I went through Richmond, Danville, "Camp Sumpter" (Andersonville), Charleston, and Florence, and during this experience, covering a period of fourteen months and thirteen days, I never heard instructions that we might do this or might not do that. Our first intimation of the violation of a rule was to see the guard raising his gun to his shoulder. They did not *always* fire, but often they did.

Thoughts on the Late War.

I WAS for Union — you, agin it.—
'Pears like, to me, each side was winner,
Lookin' at Now and all 'at 's in it.
Le' 's go to dinner.

Le' 's kind o' jes set down together
And do some pardnership forgittin'—
Talk, say, for instunce, 'bout the weather,
Er somepin' fittin'.

The War, you know, 's all done and ended,
And ain't changed no p'int's o' the compass;
Both North and South the health 's jes splendid
As 'fore the rumpus.

The old farms and the old plantations
Still occipies the'r old positions.—
Le' 's git back to old situations
And old ambitions.

Le' 's let up on this blame', infernal,
Tongue-lashin' and lap-jacket vauntin',
And git back home to the eternal
Ca'm we 're a-wantin'.

Peace kind o' sort o' suits my diet —
When *women* does my cookin' for me.—
Ther' was n't overly much pie et
Durin' the Army.

James Whitcomb Riley.

Of a Lady.

HER house is nearly in the town,
Yet shady branches round it lower,
Her tea is always on the board
At half-past four.

Her fireside has a friendly look,
There 's something happy in the air,
Her cream is such you rarely now
Meet anywhere.

She likes this shaded corner best,
The rosy lamp, the Dresden set,
A friend,—or two, perhaps,—a waft
Of mignonette.

And some one touches, in the gloom,
The harp's mysterious wailing strings,
And thoughts that never rose in words
Take music's wings.

Dear friend, though tired and far away,
I still can seek your door,—in Spain,—
Still sit beside your fire, and drink
That tea again!

Annie G. Wilson.

A Letter.

SHE wrote a letter with her eyes,
Well filled with words of bliss;
Then, like a prudent maid and wise,
She sealed it with a kiss.

Meredith Nicholson.

An Arab Saying.

REMEMBER, three things come not back :
The arrow sent upon its track —
It will not swerve, it will not stay
Its speed ; it flies to wound or slay.

The spoken word, so soon forgot
By thee ; but it has perished not :
In other hearts 't is living still,
And doing work for good or ill.

And the lost opportunity,
That cometh back no more to thee.
In vain thou weepest, in vain dost yearn,
Those three will nevermore return.

Constantina E. Brooks.

Negro Plowman's Song.

DE springtime am er-comin' en dis darky's heart am
light,
W'en de sap hit gits ter runnin' in de trees,
En I wants ter be er-laughin' f'om de mornin' tell de
night,
En er-playin' lak de green leaves in de breeze.
I feel so monstros lazy dat I does n't want ter work,
En dis mule o' mine, he foolin' in de row,
'Ca'se he feels jis like he marster, en he 's tryin' fer
ter shirk,
En I has ter larrup him ter meck him go.

[*G' up dar, sah! Doan you see my ole 'ooman er-comin'
roun' dar er-s'archin' fer sallit [salad] in de corners
ob de fence!]*

En now I feels lak hummin' on some ole-time darky
song,
W'ile de mockin'-bird am singin' f'om de hedge.
De medder-larks en robins am er-fussin' all day long,
As de cotton-tail goes dartin' frough de sedge ;
W'ile up de crick de turkle-dove am courtin' ob its mate,
En de bumblebee is buzzin' all erroun',
W'ile de martins am er-twitt'rin' at er most amazin'
rate,
En de hoss-fly am er-friskin' up en down.

[*What ails dis hyah ole critter, er-snortin' en er-kickin'
dat er way! Huh! ef hit hain't one er dem ornary
insects erready!]*

I laks ter smell de clover as hit tangles in mer toes,
En ter see de purty blossoms hyah en dar,
W'ile dogwood buds is bustin' in de low-ground whar
dey grows,
En de honeysuckle sweeten all de a'r.
En soon de juicy peaches will be drappin' ter de groun',
En de red-streaked apples tumble too;
Den de curl on de melon vine will turn er golden brown,
Er-layin' in de sunshine en de dew.

[*Golly ding! Doan dis hyah darky's mouf water fer
one on em dis hyah bressed minute! Yas, Dinah, ole
'ooman, I'se gvine ter move erlong peart now; I
was jis er-feelin' in mer pockets fer er string ter splice
dis hyah line wid. Git up dar, sah!]*

AN ARTIST'S LETTERS FROM JAPAN.

BY JOHN LA FARGE.

TO HENRY ADAMS, ESQ.

My Dear Adams: Without you I should not have seen the place, without you I should not have seen the things of which these notes are impressions. If anything worth repeating has been said by me in these letters, it has probably come from you, or has been suggested by being with you — perhaps even in the way of contradiction. And you may be amused by the lighter talk of the artist that merely describes appearances and envelops things monotonous and confused in a covering of dreams. And you alone will know how much has been withheld that might have been indiscreetly said.

If only we had found Nirvana — but he was right who warned us that we were late in this season of the world.

WHICH IN ENGLISH MEANS:

AND YOU TOO, OKAKURA SAN: I wish to put your name before these notes, written at the time when I first met you, because the memories of your talks are connected with my liking of your country and of its story, and because for a time you were Japan to me. I hope, too, that some thoughts of yours will be detected in what I write, as a stream runs through grass — hidden, perhaps, but always there. We are separated by many things besides distance, but you know that the blossoms scattered by the waters of the torrent shall meet at its end.

YOKOHAMA, July 3, 1886. — Arrived yesterday. On the cover of the letter which I mailed from our steamer I had but time to write: "We are coming in; it is like the picture books. Anything that I can add will only be a filling in of detail."

We were in the great bay when I came up on deck in the early morning. The sea was

smooth like the brilliant blank paper of the prints; a vast surface of water reflecting the light of the sky as if it were thicker air. Far off streaks of blue light, like finest washes of the brush, determined distances. Beyond, in a white haze, the square white sails spotted the white horizon and floated above it.

The slackened beat of the engine made a

great noise in the quiet waters. Distant high hills of foggy green marked the new land; nearer us, junks of the shapes you know, in violet transparency of shadow, and five or six war ships and steamers, red and black, or white, looking barbarous and out of place, but still as if they were part of us; and spread all around us a fleet of small boats, manned by rowers standing in robes flapping about them, or tucked in above their waists. There were so many that the crowd looked blue and white—the color of their dresses repeating the sky in prose. Still, the larger part were mostly naked, and their legs and arms and backs made a great novelty to our eyes, accustomed to nothing but our ship, and the enormous space, empty of life, which had surrounded us for days. The muscles of the

one hears, and yet of getting at a meaning through every sense; of being close to the top of the waves on which we dance, instead of looking down upon them from the tall ship's sides; of seeing the small limbs of the boys burning yellow in the sun, and noticing how they recall the dolls of their own country in the expression of their eyes; to see how every little detail of the boat is different, and yet so curiously the same; and then to return to the first sensation of feeling while lying flat on the bottom of the boat, at the level of our faces the tossing sky-blue water dotted with innumerable orange copies of the sun. Then subtle influences of odor, the sense of something very foreign, of the presence of another race, came up with the smell of the boat.

We climbed up the side of the big steamer and found the doctor there, who told us that he had been expecting us for a whole month; so that he soon took possession of us, and we found ourselves in the hotel launch, and at the wharf, and passing the custom house and its officers, who let everything go through quickly except my suspicious water-color blocks. Outside of the gate, in the street, we found the long-expected *jūrikisha*, an arrangement that you know probably as well as I do—a two-wheeled perambulator or gig, very small, with a hood that is usually lowered, and with a man in the shafts. Our fellows were in blue-black clothes, a big inscription on their backs; and they wore apron-like vests, close-fitting trousers, and broad straw hats poised on their heads. But you know all about these; and I have only to add that we were trundled off to our hotel, along the pretty quay which edges that part of the town, past European houses, unlike ours, and having a certain character which will probably appear very commonplace later, because it is not beautiful, but which is novel yet to us. Our hotel is also on the quay, just at a corner where a canal breaks in, and where we can see big walls and trees on the other side. Our rooms open on the water—that same blue water spangled with sunshine and fading into sky. There are men-of-war and steamers far out; picturesque junks sailing past rapidly, flattened out into mere

boatmen stood out sharply on their small frames. They had almost all—at least those who were young—fine wrists and delicate hands, and a handsome setting of the neck. The foot looked broad with toes very square. They were excitedly waiting to help in the coaling and unloading, and soon we saw them begin to work, carrying great loads with much good-humored chattering. Around us played the smallest boats with rowers standing up and sculling. Then the market-boat came rushing to us, its standing rowers bending and rising, their thighs rounding and insteps sharpening, what small garments they had fluttering like scarfs, so that our fair missionaries turned their backs to the sight.

Two boys struggling at the great sculls in one of the small boats were called by us out of the crowd, and carried us off to look at the outgoing steamer which takes our mail, and which added its own confusion and its attendant crowd of boats to all the animation on the water. Delicious and curious moment, this first sense of being free from the big prison of the ship; the pleasure of directing one's own course; of not understanding a word of what

"THE LIGHTS FLARING UPON YELLOW FACES."

edges of shadow and light against the sea and the sky, their great hollow sterns with the rudder far inboard, and sails which are open at the seams. Not far from us was a little sharp-pointed boat with a man fishing, his big round hat as important as any part of the boat. It was already late in the day. European children were out with their Japanese nurses; from time to time a phaeton or a curricie passed with European occupants, and even in this tremendous heat ladies rode out on horseback. But the human beings are not the novelty, not even the Japanese; what is absorbingly new is the light, its whiteness, its silvery milkiness. We have come into it as through an open door after fourteen gray days of the Pacific which ended only at sunrise this very morning. And we looked again at all the light outside, from the dining-room, where we lunched, where the waiters slipped about in black clothes like those of the runners, and where we were joined at table by a foreign gentleman with high cheek-bones, yellow face, and slanting eyes, and dressed in the latest European fashion with high collar, four-in-hand scarf, and pointed shoes. He was very courteous, and managed what little English he used as skillfully as he dresses. And he gave me a touch of the far East in the story of his being here; for he is under a cloud, an amiable exile whose return to his native

land might involve his being boiled in oil, or other ingenious form of death. For well as he figured at luncheon with us, I hear that he has been obliged to leave because of his having poisoned too many of his guests one day at table,—former enemies of his,—and because of his having despatched with the sword those whose digestion had resisted his efforts at conciliation. However this may be, his extradition is demanded; to which he objects, and invokes Western ideas of civilization, and protests that his excesses have been merely political. And then late in the afternoon we sauntered out into the Japanese quarter; walking, so that we may mingle with the gray, black, and blue crowd, and respectfully followed by our jinrikisha men, who slowly dragged our carriages behind them, like grooms following their masters. We stopped at little curio shops and bargained over miserable odds and ends, calling up, I feel sure, the unexpressed contempt of the doctor, the great collector of precious lacquers; but it is so amusing to see things as they are, and not as they should be. And we went into a show which had an enormous draped sign outside, and where, in uncertain darkness, an old, miserable, distorted dwarf played the part of a spider in a web, to the accompaniment of fiendish music and the declamation of the showman. Then we lingered

outside of a booth in which a wrestling match was going on, but did not enter, and we saw the big wrestlers go in or come out, their shoulders far above the heads of a smaller race of men, and we turned at every moment to look at the children, many of whom are so pretty, and who seem to have an easy time of it. Men carry them in their arms as women do

structure, the usual Japanese house. I came near saying that the little railway station is like ours; but it is better than most of ours, with neat arrangements. We entered the little cars; I noticed, in the third class, Japanese curled up on the seats. The grade is as level as a table, the landscape is lovely, and we saw the shapes we know so well in the prints—

CASTLE, AND MOAT WITH LOTUS.

with us, and many a little elder sister walks about with the infant of the family slung behind her maternal shoulders. And then there are curious combinations of Western and Eastern dress—rarely successful. Our hats and shoes and umbrellas—all made here—are used, and our ugly shirts stiffen out the folds of the soft Japanese robes; but the multitude wear their usual dress and make no abuse of hats.

Wearied by the novelty, every detail of which, however, was known to us before, we walked back in the white, milky sunset, which was like a brilliant twilight.

JULY 5.—We made our first visit to town yesterday; that is to say we went to Tokio, which is about twenty miles off. Of course we took our jinrikishas at the door of the hotel, and passing through the wide Yokohama streets saw the semi-European houses, some with high garden walls in which are small doors: there are sidewalks, too, and European shops, and colonial buildings, post-office, and telegraph office; and the Japanese *kura*, or storehouses—heavy tile-roofed buildings with black and white earthen surfaces, the black polished to a glaze, as was done with Greek and Etruscan vases. They have deep windows or doors, recessed like our safes, with a great air of solidity, which contrasts with that temporary wooden

the curious shapes of the Japanese pines; little temples on the hillside; and rice-fields with their network of causeways, occasionally a horse or peasant threading them. The land is cultivated like a garden, the lotus leaves fill the ditches, and one or two pink flowers are just out. From time to time we saw stretches of blue sea. And once, for an instant, as I looked up into the hazy, clouded sky, far beyond the hills, that were lost in the mist into which the rice-fields stretched, I saw a pale, clear blue opening in which was an outline more distinct, something very pure, the edge of a mountain, looking as if it belonged to another world than the dewy moist one in which we are—the cone of Fusi-yama.

ON passing through the station, very much like the other with its various arrangements for comfort and order,—first, second, and third class rooms, and so forth,—we met a crowd of jinrikishas with their runners, or, as my friends tell me to call them, *kuruma* and *kurumaya*, every man clamoring for patronage in the usual way of the hackmen.

We selected as a leader Chojiro, who speaks English—a little; is a traveled man, having gone as far as Constantinople; wears the old-fashioned queue, flattened forward over the top of his shaven head; and whose naked feet were

to run through the day over newly macadamized roads, for which a horse would need to be well shod. A little way from us, on the square, stood the car of the tramway, which runs as far as Asakusa, to the great popular temples of protecting divinities, Quan-on and Jizo,—and Benten, from whose shrine flowed one day copper coins as if from a fountain,—where Buddhist sermons are preached daily; which are full of innumerable images, pictures, and ex-votos; and where prayer-wheels, duly turned, help the worshiper to be free from annoying sins, or to obtain his desires.

How shall I describe our ride through the enormous city? We were going far across it to call on Professor F——, the great authority on Japanese art, and to be delighted and instructed by him through some fragments of his collection.

In the first street where the tramway runs there are semi-European façades to houses, and in their pilasters the Ionic capital has at length made the circle of the world. Then we took more Oriental and narrower streets, through the quarter of the *gei-sha*, the dancers and singers who go out perpetually to put a finishing touch on entertainments. At such early hours they are of course unseen. Where houses seemed more closed than usual servants were attending to household duties, and we heard the occasional strum of a guitar. Then great streets again, with innumerable low houses, the usual shops, like open sheds, with swinging signs, carved, painted, and gilded, or with draperies of black cloth marked with white characters. Merchants sat on their mats among the crowded goods, girls at corners drew water from the wells; in a narrower street the black streak of a file of bulls peacefully dragging merchandise; where the crowd was thickest a black lacquered palanquin, all closed, in which was shut some obstinate adherent to ancient fashions. Then bridges and canals, and great empty spaces, long white walls with black copings, and buildings that continued the walls, with gratings like those of barracks. These were the *yashikis*—inclosed residences of princes who were formerly obliged to spend part of the year at the seat of government with small armies of retainers. Then the walls of the castle, great sloping ramparts of irregular blocks of masonry, about which stand strangely twisted pine trees, while the great moats of clouded water are almost filled with the big leaves of the lotus. Now and then great gates of gray wood, and enormous doors. On some of the wide avenues we met cavalry officers in European costume, correct in style, most of the younger with straggling mustaches long and thin, whence their nickname of “horn-pouts,” naturally connected with that of the “cats,” devourers of fish, as the *gei-sha* are called. Near of-

AT THE WELL.

ficial buildings we saw a great deal of black frock coats, and trousers, and spectacles. Everything was seen at a full run, our runners dragging us at horses' pace. Still it was long before we reached our destination. Streets succeeded streets, empty or full, in desolate, Oriental wearisomeness. At length we stopped at a little gate in a plank fence, and entered a vast high space, formerly a prince's park, at one end of which we saw trees and hills, and we came to the professor's house, a little European structure. My mind is yet too confused with many impressions to tell you of what we saw that afternoon and evening, and what was said; all the more that the few beautiful paintings we looked at out of the great collection lifted

me away from to-day into an indefinite great past. I dislike to use analogies, but before these ancient religious paintings of Buddhist divinities, symbolical of the elements or of protective powers, whose worn surfaces contained marvels of passionate delicacy and care framed in noble lines, I could not help the recall of what I had once felt at the first sight of old Italian art.

WE passed from this sense of exalted peace to plunge again into the crowded streets at night. It was late; we had many miles to go to catch the last train; two additional runners had been engaged for each kuruma—one to push, one to be harnessed in front.

Then began a furious ride. Mine was the last carriage. We were whirled along with warning cries of "Hai-hai!" now into the dark, then into some opening lighted by starlight, in which I could see the flitting shapes of the other runners and of my companions. I remember the creaking of their carriages, the jerking of them with each pull of the men; then our crossing suddenly other parties lighted by lanterns like ourselves, the lights flaring upon yellow faces and dark dresses and black hair; then our turning some narrow corner and plunging at full speed into lighted streets crowded with people, through whom we seemed to cut our way. Much shouting of our men, and dodging of wayfarers with lanterns, and of bystanders who merely turn enough to let us glide by. Then one of my runners at full gallop struck a post and was left behind; another was gathered in somehow without a stop, and we tore through the city, still more crowded as we came nearer to our end—the railway station. We were in time, and we slept in the now familiar train. We reached the deserted station and were jogged peacefully to our hotel; our men, in Japanese fashion, sleepily turning out of the way of the ownerless dogs that lay in the middle of the streets. And when I awoke in the morning I found that the day's impressions had faded in sleep to what I tell you.

JULY 6.—I have been asking myself whether it would be possible to have sensations as novel, of feeling as perfectly fresh and new things I knew almost all about beforehand, had we come in any other way, or arrived from any other quarter. As it is, all this Japan is sudden. We have last been living at home, are shut up in a ship, as if boxed in with our own civilization, and then suddenly, with no transition, we are landed in another. And under what splendor of light, in what contrasting atmosphere! It is as if the sky, in its variations, was the great subject of the drama we are looking at, or at least its great chorus. The

beauty of the light and of the air is what I should like to describe, but it is almost like trying to account for one's own mood—like describing the key in which one plays. And yet I have not begun to paint, and I dread the moment of beginning to work again. Rather have I felt like yielding entirely to the spirit in which I came, the intention of a rest, of a bath for the brain in some water absolutely alien. A—— and I had undertaken that we should bring no books, read no books, but come as innocently as we could; the only compromise my keeping a scientific Japanese grammar, which being ancient and unpractical might be allowed, for it would leave me as unready as on the day I left.

THE doctor took us on Sunday afternoon to his club—whose name I think means the perfume of the maple—to see and to listen to some Japanese plays which are given in the club theater built for the purpose. We went there in the afternoon, passing by the Shiba temples, and our kurumas were drawn up at one end of the buildings. There everything was Japanese, though I hear stories of the other club and its ultra-European ways—brandies-and-sodas, single eyeglasses, etc. However that may be, on this side we were in Japan without mistake. We sat on the steps and had our shoes taken off, according to the Japanese fashion, so, as not to injure mats, and we could hear during the operation long wailings, high notes, and the piercing sound of flutes and stringed instruments; the curiously sad rhythm mingled with a background of high, distinct declamation. We walked in, with careful attention to make no noise, forgetting that in our stocking feet we could have made none had we wished, and we found the doctor's place reserved for him and us, and marked with his name, writ large. Other low boxes, with sides no higher than our elbows as we sat on the mats, divided the sloping floor down to the stage. The stage was a pretty little building projecting into the great hall from its long side. It had its own roof, and connected with a long gallery or bridge, along which the actors moved, as they came on or disappeared, in a manner new to us, but which gave a certain natural sequence and made a beginning and an end,—a dramatic introduction and conclusion,—and added greatly to the picture when the magnificent dresses of stiff brocade dragged slowly along to the cadence of the music. The boxes were mostly occupied and by a distinguished-looking audience; the Nô, as this operatic acting is called, being a refined, classical drama, and looked upon differently from the more or less disreputable theater.

NÔ DANCER WITH MASK, REPRESENTING THE SAKÉ IMP.

Hence the large proportion of ladies, to whom the theater is forbidden. Hence, also, owing to its antiquity and the character of its style, a difficulty of comprehension for the general public that explained the repeated rustle of the books of the opera which most of the women held, whose leaves turned over at the same moment, just as ours used to do at home when we were favored by French tragedy.

A quiet, sleepy appreciation hovered over
VOL. XXXIX.—68.

the scene; even the devotees near us, many of them older people and belonging to the old régime, showing their approval or disapproval with restrained criticism. I could see without turning my head the expression of the face of my neighbor, a former daimio, a man of position; a face a Japanese translation of the universal well-known aristocratic type—immovable, fatigued, with the drooping under lip. Behind him sat former retainers, I suppose—deferential, in-

sinuating remarks and judgments to which he assented with inimitable brevity. Still, I thought that I could distinguish, when he showed that the youthful amateurs—for most of the actors were non-professional—did not come up to a proper standard, that his memory went back to a long experience of good acting. And so catching are the impressions of a crowd that I myself after a time believed that I recognized, more or less distinctly, the tyro and the master, even

ANCIENT.

though I only vaguely understood what it was all about. For I need not tell you that the libretto would have been still more difficult for me than the pantomime before me; and very often it was but pantomime, the actor making gestures to the accompaniment of music, or of the declamation of the choregus, who told the poetic story. Occasionally these movements amounted to a dance, that is to say, to rhythmic movements—hence called the *Nô* dance—to which emphasis was given by rising and falling on either foot, and bringing down the sole with a sudden blow.

There were many short plays, mostly based

on legendary subjects, distinguished by gorgeous dresses, and occasionally some comic scenes of domestic life. The monotony of impression was too novel to me to become wearisome, and I sat for several hours through this succession of separate stories, patient, except for the new difficulty of sitting cross-legged on the mats. Moreover, we had tobacco to cheer us. On our arrival the noiseless servants had brought to us the inevitable little tray containing the fire-box with hot charcoal and the little cylinder for ashes, and tea and little sugary balls; and then, besides, notwithstanding the heightened repose of the audience, there was enough to watch. There were the envoys from Loo Choo, seated far off in the dim light of the room, dressed in ancient costumes, their hair skewered up on the top of the head with a double pin—grave and dignified personages; and a European prince, a Napoleonic pretender, seated alongside, with his suite, and ourselves, the only foreigners. The types of the older people were full of interest, as one felt them formed under other ideas than those of to-day. And though there were no beauties, there was much refinement and sweetness in the faces of the women, set off by the simplicity of their dresses, of blacks, and browns, and grays, and dull violets, in exquisite fabrics, for we were in an atmosphere of good breeding. And I watched one of the young ladies in front of me, the elder of two sisters, as she attended to every little want of her father, and even to his inconveniences. And now it was time to leave, though the performance was still going on, for we wished to return in the early evening. Our shoes were put on again at the steps, our umbrellas handed to us,—for sun and rain we must always have one,—and we passed the Shiba temples and took the train back for Yokohama.

JULY 12.—We are doing nothing in particular, hesitating very much as to what our course shall be. One thing is certain—the breaking out of the cholera will affect all our plans. Even the consequent closing of the theaters shows us how many things will be cut off from us. We spend much time in such idleness as bric-à-brac, letting ourselves go, and taking things as they come.

The doctor's kindness is with us all the time. One feels the citizen of the world that he is when he touches little details of manners here, now as familiar to him as those of Europe.

I enjoy, myself, this drifting, though A—— is not so well pleased, and I try to feel as if the heat and the novelty of impressions justified me in idleness. Once only I was tempted to duty, however, when we went to the temples of Shiba and of Uyèno, where are the tombs of

the shōguns, rulers of Japan of the Tokugawa line. They are all there but the two greatest, Iyéyasū and Iyémitsū, who lie at Nikko, the sacred place, a hundred miles away. Here in Tokio are the tombs of the others, and the temples about them, splendid with lacquer and carving and gold and bronze, and set among trees and gardens on these hills of Shiba and Uyēno.

My dreams of making an analysis and memoranda of these architectural treasures of Japan were started, as many resolutions of work are, by the talk of my companion, his analysis of the theme of their architecture, and my feeling a sort of desire to rival him on a ground for fair competition. But I do not think that I could grasp a subject in such a clear and dispassionate and masterly way, with such natural reference to the past and its implied comparisons, for A——'s historic sense amounts to poetry, and his deductions and remarks always set my mind sailing into new channels.

But I must put this off—certainly for to-day—while we discuss whether we shall make our visit to ancient Kamakura and the great bronze statue and the island of Enoshima, or whether to put it off until our return from Nikko, and our seeing the other shrines of the shōguns, there. The doctor, who has just left Nikko, tells us of its beauty in the early summer, a few weeks ago, and I feel all the hotter as he talks of the cold mountain streams which run by his house, and of banks of azaleas covering the high rocks. And then the Japanese proverb says, "Who has not seen Nikko cannot say beautiful."

John La Farge.

MODERN.

THOUGHT.

ACROSS the tense chords
Thought runs before words,
Brighter than dew,
And keener than swords.
Whence it cometh,
And whither it goes,
All may conjecture,
But no man knows.
It ebbs and flows
In the dancing of the leaves,
The set of summer eves,
The scent of the violets, the secret of the rose.

Richard Henry Stoddard.

THE OLD BAND.

IT 'S mighty good to git back to the old town, shore,
 Considerin' I 've be'n away twenty year and more.
 Sence I moved then to Kansas, of course I see a change,
 A-comin' back, and notice things that 's new to me and strange ;
 Especially at evenin' when yer new band fellers meet,
 In fancy uniforms and all, and play out on the street—
 . . . What 's come of old Bill Lindsey and the Sax-horn fellers — say ?
 I want to hear the *old* band play.

What 's come of Eastman, and Nat Snow ? And where 's War Barnett at ?
 And Nate and Bony Meek ; Bill Hart ; Sam Richa'son and that
 Air brother of him played the drum as twicet as big as Jim ;
 And old Hi Kerns, the carpenter — say, what 's become o' him ?
 I make no doubt yer *new band* now 's a competenter band,
 And plays their music more by note than what they play by hand,
 And stylisher and grander tunes ; but somehow — *anyway*
 I want to hear the *old* band play.

Sich tunes as "John Brown's Body," and "Sweet Alice," don't you know;
 And "The Camels is A-comin'," and "John Anderson, my Jo";
 And a dozent others of 'em — "Number Nine" and "Number 'Leven"
 Was favo-rites that fairly made a feller dream o' heaven.
 And when the boys 'u'd saranade, I 've laid so still in bed
 I 've even heerd the locus' blossoms droppin' on the shed
 When "Lily Dale," er "Hazel Dell," had sobbed and died away —
 . . . I want to hear the old band play.

The *new* band maybe beats it, but the *old* band 's what I said —
 It allus 'peared to kind o' chord with somepin' in my head;
 And, whilse I 'm no musicianer, when my blame eyes is jes
 Nigh drowned out, and Mem'ry squares her jaws and sort o' says
 She won't ner never will fergit, I want to jes turn in
 And take and light right out o' here and git back West ag'in —
 And *stay* there, when I git there, where I never haf to say
 I want to hear the old band play.

EDWIN FORREST ABOUT 1835.²

EDWIN FORREST.

IN the year 1854 I became manager for John T. Ford of the theater in Richmond, Virginia. The romantic drama of "The Sea of Ice" was produced with splendid success, and was followed by "The Naiad Queen," which enjoyed equal popularity. The season was altogether quite a brilliant one, and included among its attractions some of the first stars of the country. Miss Agnes Robertson, known as the "Fairy Star," accompanied by her husband, Mr. Dion Boucicault, headed the list, which terminated with Edwin Forrest. This popular tragedian was then in his prime, and what a handsome fellow he was! The form of an Apollo, with the strength of a Hercules: his deep, musical voice was under perfect control, and in the pathetic scenes of *Cade* and *Virginus* full of tears. As a melodramatic actor he stood

ahead of all his competitors. In Shakspearian characters he was considered too robust and extravagant. So far as matters relating to his own profession were concerned, he was undoubtedly a student, his readings being faultless, and full of feeling. In private he could be very agreeable; his conversation was both humorous and witty, and his anecdotes were told with excellent effect. During my long professional life I met him frequently, and I should say that much of his unhappiness—for he was a very unhappy man—came from an irritable temper, under little control. His nature, unfortunately, was not softened by that sweet and gradual ascent to good fortune that is so humanizing. Happy are those who in the race for fame advance steadily and by degrees, making no hurried strides, but losing no ground; shaking hands with their competitors as they go by them, and making honest room for them to pass should they come up again. Forrest with one leap bounded to the front. No new triumphs awaited him, and as old age came on he could only witness younger and fleetier metal pass him by. During those fits of anger which came upon him from the inefficiency of his dramatic support he was childish and unreasonable—having no power of recognizing the distinction between a man who tries his best and fails, and he who fails because he does not try at all.

During the engagement of which I am about to speak, and on one occasion while we were rehearsing "Damon and Pythias," Edwin Adams, who was cast for *Pythias*, was going through the exciting scene in which that character parts with *Calanthe*. Forrest took exception to the business arrangements of the stage; but as this was one of his quiet, dignified mornings, he made his objections with respectful deference, saying that if Mr. Adams would allow him he would suggest some new business that might improve the scene. Adams expressed himself as quite willing to receive any instruction; so Forrest went through the parting with *Calanthe*, giving some new and very good suggestions. Adams tried but failed to catch Forrest's idea. It was tried over and over till finally Forrest became impatient. Again taking Adams's place, he rushed towards the fainting form of *Calanthe*, and as he dropped

upon his knee, throwing his head tragically forward, his hat fell off. Now it is always a comical thing to see a man's high black-silk hat tumble from his head, but especially when he is going through a tragic scene. Forrest for a moment hesitated whether he should pause and pick up the hat or not; at last he made a savage grab for it, but it eluded his grasp, and, slipping through his fingers, rolled round the stage, he pursuing it with tragic passion. The company, one by one, turned their heads away, quietly enjoying his discomfiture. At last he secured it, and fixing it firmly on his head, he proceeded with the action of the scene. He felt we had been laughing at him, and became furious. Rushing upon *Calanthe*, he embraced her again and again. "Farewell, my love," cried he in dire woe. He then tore himself from her embrace, and madly careering up the stage ran head first into a scene that the carpenters were moving across the stage, mashing the unlucky hat over his eyes. He struggled manfully to get it off, but with no effect till Adams and myself came to the rescue. We were now all in a roar of laughter. For a moment he looked bewildered and even angry, but as the absurdity of the scene dawned upon him he joined in the merriment, and said it was the most ridiculous thing that had ever occurred.

At the conclusion of the Richmond engagement the company journeyed to Washington, where we were to open with Forrest as *Metamora*—a character that he detested, and one that the public admired. Forrest was always in a state of intense irritation during the rehearsal and performance of this drama. Irregularities that he would have overlooked under ordinary circumstances were now magnified to an enormous size, so that when he donned the buckskin shirt, and stuck the hunting-knife of the American savage in his wampum belt, he was ready to scalp any offending actor who dared to cross his path. The copper-colored liquid with which he stained his cheeks might literally have been called "war paint."

At the rehearsal the poor property man, old Jake Search, got in a dreadful state of nervousness, and everything went wrong. The tragedian naturally held me, as stage-manager, responsible for these accidents, particularly as the unlucky Jake would conceal himself behind set pieces, or mysteriously disappear through traps as each mishap occurred. In the midst of this dreadful confusion, principally brought about by his own ill-humor, Forrest turned on me, saying he would not act that night, and strode out of the theater. I hurried through the front of the house, and heading him off in the alley addressed him, as nearly as I can remember, in the following words:

"Mr. Forrest, before you decide upon this step let me state an important fact, that perhaps has not crossed your mind." He saw I was in earnest, and stopped short to listen, as I resumed: "Mr. Ford, the manager, is absent, so I must take his responsibility to the public on myself. The blunders on the stage this morning have been unfortunate, perhaps culpable, but you must pardon me for saying that your excited manner and somewhat unreasonable demands have contributed not a little to confuse the company and bring about this disorder. But be that as it may, there is another and still more important matter to consider. Every seat in the theater is taken for to-night; the audience will crowd the house in expectation of a great dramatic treat, to which they have been looking forward for some time. If you decline to act, and so break your contract with the public, what course is left for me? Why, only this: I must wait for the vast concourse of people to assemble, and then go before them and explain the reason of your non-appearance. I shall have to make a clear statement of the case, and say that you have refused to act because there were some slight discrepancies and irregularities in the rehearsal. The public are, you know, quite unreasonable when their diversion is checked, and it is likely that they will be indignant at the disappointment, failing to see the reason as clearly as you may have done. Now consider for a moment: under these circumstances will it not be more magnanimous in you to overlook the shortcomings and go on with the rehearsal?"

He paused for a moment and said: "I will not go back to the rehearsal. I am too much excited, and my presence on the stage now will only make matters worse; but if you will see that details are attended to, I will act to-night."

I promised to do so, and we parted. I was only too glad to get rid of him on those terms, in his then intemperate state of mind. I went back to the stage and dismissed the rehearsal, cautioning the actors to do what they could to render the night's performance creditable. I now began to hunt up the delinquent and frightened property man, Jake Search,—an appropriate name for a fellow who needed so much looking after,—and discovered him hiding under a pile of old scenery. "Is he gone?" said Search. "Yes," I answered, "but he will return to-night; so see that your properties are in good condition, or he will be the death of you."

The night came and matters progressed favorably until the council scene. One of the characters here, being overcome with nervousness, reversed his questions to *Metamora*,

Edwin Forrest,

giving the wrong lines, and of course receiving an absurd answer. The audience, recognizing the confusion of the dialogue, began to laugh, and of course this made matters worse. The act terminates with the Indian's great speech, "From the east to the west, from the north to the south, the loud cry of vengeance shall be heard," and here he hurls his knife into the center of the stage, where it quivers a defiance as the curtain falls. In his anger and excitement the blade failed to stick in the stage and bounded into the orchestra, the handle hitting the double-bass player on the top of his head, which was as innocent of hair as a billiard-ball, so as the curtain came down the old fellow was stamping about and rubbing his bald pate to the delight of the audience.

I realized now that the storm had burst in earnest and that a total wreck would soon follow. Knowing that I could not avert the catastrophe, and having no desire to face the tragedian's wrath, like a politic but disloyal captain I deserted the ship and went in front to see it go down. Byron says of a battle, "Oh, what a sight to him who has no friend or brother there!" to which Prentice adds, "and is not there himself." The latter was now my case. I was not there myself, and I did not intend to be, so from the secure corner of an upper private box I watched the progress of the most disastrous performance I had ever seen.

As the curtain rises on the last act the tribe of *Metamora* should rush through the woods as their leader calls them; but by this time the braves were so frightened that they had become demoralized, and as the foremost rushed through the opening in the woods his long bow got crosswise between two trees. This not only precipitated the redskin over it, but the entire tribe followed, tumbling head over heels into the middle of the stage. I trembled now lest the "big Injun" would refuse to put in an appearance. At last, to my relief, the audience quieted down and Forrest strode upon the stage. If I remember the story, at this point *Metamora's* wife and children had been stolen away and murdered. His pathos was fine, and by his magnificent acting he reduced his audience to attention and enthusiasm. All was now going well, and I looked forward to a happy termination of the play, which I was thankful to know had nearly reached its climax.

A funeral pile of burning fagots was then brought on, at which some pale-face was to be sacrificed. The two Indians in charge of this mysterious-looking article set it down so unsteadily that a large sponge, saturated with flaming alcohol, tumbled off and rolled down the stage, leaving a track of fire in its wake.

"Put it out!" said Forrest, "put it out!" whereupon the two Indians went down on their knees and began to blow alternately in a seesaw way, singeing each other's eyebrows at every puff. The audience could not stand this comical picture, and began to break forth in laughter. "Let the theater burn!" roared Forrest. At last one tall Indian, supposed to be second in command, majestically waved off the two who were blowing, and stamped his foot with force and dignity upon the flaming sponge, at which a perfect fountain of burning alcohol spouted up his leather legs. He caught fire, tried to put himself out, rubbing and jumping about frantically, and at last danced off the stage in the most comical agony. Forrest made a furious exit; the curtain was dropped, and the public, in perfect good nature, dispersed. I mingled with the crowd as it went forth, and I never saw an audience, at the end of a five-act comedy, wreathed in such smiles.

Forrest's first dramatic career in London was undoubtedly a success, though "The Gladiator" was an unwise selection for the opening night. It is a bloody piece of business altogether, and it is a play that could not fail to disgust the sensibilities of a select audience. An actor visiting England, as Forrest did, not only with a great reputation, but as unquestionably at that time the representative tragedian of America, naturally drew the first people of the land to meet him. It must be borne in mind that a first night's audience never represents the general public, particularly on an occasion of this kind. The event was an international one. It was the first dramatic challenge that America had ever given to England. The theater was filled with a critical audience. Statesmen and authors, with the nobility and gentry of the land, were assembled at Drury Lane to witness the début.

Upon an audience like this the most delicate coloring would have had its effect. An artist could scarcely be too subtle before an array of such nice discrimination. When the American actor came upon the stage the symmetry of his form, his manly bearing, and the deep music of his voice produced a strong impression upon the house; but as the play progressed, revealing only the tumult of brutal passions, disappointment fell upon the house. This crude and extravagant drama ends with the central figure bathed in blood, biting the dust, and writhing in the agonies of death. Nothing but the fine acting of Forrest could have sustained this drama before such an audience.

As an actor he was a success, and the play, that caught the public taste, if it failed to please the judicious, was acted for several nights. There can be no doubt that if he had played *Lear* or *Othello* before the rare audience that

PHOTOGRAPHED BY BRADY.

FORREST AS "METAMORA."

ENGRAVED BY T. JOHNSON.

came to witness his début, and which he could not hope again to assemble in such force, his success as a Shakspearean tragedian would have been pronounced.

Forrest's second visit was full of tumult. William Macready, then the reigning favorite as a Shakspearean actor in England, was an intimate friend of Mr. Forster, the dramatic critic; and Forrest publicly declared that it was in consequence of this intimacy that he had been abused in the papers, and more than hinted that Macready was in a conspiracy with Forster to malign him. History will never join with Forrest in this belief. Macready's position was so well assured in London that he could not possibly fear a rival. And the life-long record of Macready clearly shows that he was too honorable a man meanly to connive at another's downfall.

After his engagement was over Forrest went to see his rival act, and because the latter introduced some business that Forrest disapproved of he hissed Macready from the front of the house. To say that this was in bad taste is to put too mild a disapproval upon such a rude and unprofessional act. It was the culmination of Forrest's waywardness and ill temper. But the unfavorable notices in London had stung him to the quick. The virus of adverse criticism rankled in his veins. The eagle of the American stage was in a frenzy; his plumage had been ruffled by the British lion. So giving that intolerant animal one tremendous peck, he spread his wings and sailed away.

I have no doubt that he had often acted *Othello*, *Lear*, and perhaps *Hamlet* with all that care and study could compass, but the audience refused to respond; and knowing that there was a "lurking devil" in him, they sat dumb and sullen until it was let loose.

A dramatic critic told me that he was paid a stated sum of money to go to the theater regularly every night during Forrest's engagements at the Broadway Theater in 1856, for the purpose of writing him down. This gentleman (?) had lately come from England, and until this time had scarcely seen a Shakspearean play. He was a fluent writer, but had not the remotest idea of the thought and philosophy contained in the plays of which he was to write. He said he would get a book of the tragedy that was to be acted at night, read it up, then form his own conception of how the character should be acted, and if Forrest did not render it to his way of thinking,— which fortunately for the public he never did,— he, as the critic, would cut the actor all to pieces. These criticisms did more good to the actor than harm. Unjust abuse generally has this effect. Feeling that these articles were actuated only by malice, the public came in crowds to indorse the actor.

Unfortunately the tragedian lost his temper and addressed the audience from the stage, pleading his own case and hurling anathemas at "the irresponsible assassins of the pen." There was no necessity for this. His friends had already taken up cudgels for him and rallied to his support. It was like a successful candidate asking his constituents, after they have elected him, to add to the obligation by throwing his unsuccessful rival out of the window.

Edwin Forrest, with all his faults, had warm and generous impulses. I know of one instance where a poor, old actress went to him in distress. In former years he had known her father and respected him. Touched by her appeal for assistance, he lent her a large sum of money, with the almost certain knowledge that he would never get it back again. It was never made public; no one knew of it but the receiver and myself. The Forrest Home has done much good, and is likely to do more; and those actors who either by age or by infirmities have been debarred the privilege of following their profession will naturally be grateful for this rich legacy.

Even in the days of his theatrical fame and prosperity Forrest was an austere man, and as he grew older he became morbidly misanthropical, holding himself aloof from all but his most intimate friends. The latter part of his life was embittered, too, by illness and the loss of public favor. Until the closing years of his career he had been blessed with perfect health; this became suddenly shattered, and the unexpected attack wrecked his dramatic power. He might have borne the stroke of illness, but to one whose imperious nature could not brook the faintest slight the loss of public admiration was a heavy blow; one, too, that would have shocked a wiser and more even-tempered man than Edwin Forrest. Still he toiled on, and was unjustly censured for acting past his powers. But what was he to do? His physicians told him that he must act if he would live; the wheel must be kept in motion or it would fall. His performances in the larger cities were given to empty houses, while bright and youthful aspirants were drawing from him all his old adherents. His former friends forsook him, and naturally, too; they could not bear the pain of witnessing their favorite of other days declining night by night. No actor can hope to hold an interest in his audience merely by what he has done in years gone by; in acting it is the present that the public have to deal with, not the past. To witness age and decrepitude struggling to conceal their weakness in the mimic scene is too painful. The greater our affection for the artist the less can we bear to see him suffer and go down.

PHOTOGRAPHED BY BRADY.

FORREST AS "KING LEAR."

ENGRAVED BY T. JOHNSON.

In the vain hope of struggling on, the old tragedian sought "the provinces." Here the people flocked in crowds to see the great actor that they had heard of from their childhood; not with the faintest hope that they would find the grandeur of the past, but from the curious desire to see a ruined tower just before it falls.

FROM LONDON TO PARIS.

I SAILED for England in the clipper ship *Neptune*, in June, 1856. This was my first visit to Europe, and London was a rare treat to me. It was rich in comedians and poor in tragedians. Robson and Wright were especially fine; Compton was quaint and legitimate, and Buckstone funny. Mr. Phelps was an actor of such versatility that he could scarcely be called a tragedian. His range was wider than that of any other actor in England. *Macbeth*, *Sir Pertinax*, *McSycophant*, *Malvolio*, *King Lear*, *Sir Anthony Absolute*, and *Bottom* take in the vast area of the legitimate drama. I saw him in two of these characters only, but it is generally conceded that he was equally fine in all of them.

From London I went to France. My mother's parents were from this lovely country, and I longed to see it. We arrived quite early in the afternoon, and then I looked for the first time on the picturesque city of Dieppe. What a transformation had taken place in a few short hours from London! Why, if a hole could have been bored at Waterloo Bridge and I had dropped through the earth, coming out at China, the contrast would not have been greater. Climate, costume, architecture, and language—the change was complete: eight-storied picturesque houses, with three-storied roofs, each story projecting a little beyond the other till at the top they almost meet, making it quite convenient for the occupants in the garret windows to shake hands with one another across the street; all the windows filled with the excited inhabitants chatting to one another and violently gesticulating. The streets were thronged with people: women in wooden shoes, blue petticoats, and high, stiff, white caps, carrying baskets and generally doing all the work; lazy men in blue blouses, quietly submitting to it without a murmur; they were lolling on the piers, slyly laughing and winking at one another as they gazed the cockney and Yankee tourists. A swell table d'hôte dinner, for swell tourists, was carefully avoided by myself and companion; so we slipped around the corner and got a cheap repast, consoling ourselves that by traveling economically you always have a better chance to study character. With this object partly in view, and with knowledge of our slender

purse, we purchased second-class tickets on the train for Paris. It was midsummer, and as we started at 6 P. M. there were still three or four hours of golden twilight for us. What a panorama of beauty! We saw the quaint French farms and picturesque châteaux as we skirted along the lovely banks of the Seine; there Rouen with its majestic cathedral loomed up as the moon rose over the river.

At eleven o'clock we arrived in Paris. I drove to Hôtel Byron in Rue Richelieu, and after supper determined to get a view that night of the church of Notre Dame. Past twelve o'clock and the full moon high in the heavens; it was just the time to see it. A cab had us there in twenty minutes. How grandly it stood out against the dark blue sky! We recrossed the Seine, and I stopped the cab to get out on the bridge. Straight before me were the gloomy towers in which Marie Antoinette was confined during the Reign of Terror. I almost fancied that I could see the pale face of the murdered queen gazing with anguish through the iron-grated windows. The French cabman did not quite get into his head what was the matter with me. I think my gloomy looks made him suspicious that I was contemplating suicide and had brought him there as an accessory; for he got quite close to me, evidently intending to grab me by the collar and force me into the cab at the first hint of a plunge. He heaved a sigh of relief as I got into the cab, and drove away from the bridge much faster than he came to it.

AN EARLY COMEDY.

HÔTEL BYRON was in the busy part of the city, so I was awakened at sunrise by a hum of voices and the rattle of cabs: bakers, milkmen, and venders of fruit and vegetables were trying to drown one another with their various cries. Perhaps a week later than this it would have been annoying, but now the sounds were so strange to my ears that I was only too delighted to be awakened by them. I had just finished dressing when I heard a fearful quarrel in the courtyard: looking out of the window I saw a most curious group of people. There was a fat man, in a white apron and cap (the cook), armed with a large wooden spoon, and a thin baker, with a long loaf of bread, measuring at least four feet, beating each other over the head and shoulders with these deadly weapons. The landlord had embraced the baker and was trying to tug him away; the landlady was endeavoring to do the same with the fat cook, but his dimensions defied her; a kindly milkman and two waiters got in between the belligerents, and in so doing received most of the punishment. Nothing

could be more comical than to watch this exciting but bloodless encounter—the frantic yells of the landlord, the screams of the landlady, the milkman and the two waiters rubbing themselves as the spoon of the infuriated cook and the long loaf of the angry baker descended upon their heads. In the midst of the encounter and the thickest of the fight a huge milk-can was kicked over, and a foaming white flood deluged the middle of the yard. This dreadful accident stopped the fray at once—oil poured upon troubled water could not have been more effectual; economy is a passion with the people of Paris. There was a groan of horror from the milkman, who stood with his shoulders shrugged up to his eyes, his arms stiffened, his hands spread out, and his legs wide apart, surveying the disaster; his stock in trade, once pure and white as the driven snow, was slowly flowing down the middle of the yard, and as it “mixed with the baser matter” became a pearly gray, and so deepened into an inky hue as it reached the gutter of the street. The poor fellow was now the center of attraction. The belligerents crowded around him offering their sympathy; if they could not restore his merchandise, they could at least smother him with the milk of human kindness. The cook and the baker looked on in self-reproaching silence, the waiters assisted the unfortunate man to a chair, and the landlady soothed him with a glass of claret. Now a reaction set in. A faint smile mantled the milkman’s face, then they all broke out into a roar of laughter as the comical side of the picture presented itself; the waiters fairly danced with merriment, the cook embraced the baker, who punched him in the stomach with delight, and so ended the first and only fight I ever saw in Paris.

After breakfast I consulted my memorandum and guide-book. What a list of things to see! How could I get through it in the time? Where should I go first? I have since seen my children in this uncertain condition in a toy-shop, and have always felt for them as I remembered this eventful time; for we are only children of a larger growth, and must have all felt this delightful torture. My guide was now engaged; his name was François. He was a capital hand at business, so far as industry was concerned; his vitality, too, was wonderful. Quick, agile, witty, and vivacious, nothing was a trouble to him so long as it was to his taste; but if I suggested some place to visit that he in his vocation was tired of, the humbug of his nature came into full play, and he would disparage the proposal with the true tact of a Frenchman. Not that he was dishonest; on the contrary, where money was concerned he was scrupulously particular, but the

artistic side of his nature delighted to assert itself.

On my second visit to Paris, twenty years after, I was struck with some curious incidents that illustrate the devotion of the French to art and their uncertain loyalty to the reigning government. Over their doors and on the cornices of their public buildings the Republican motto “Liberty, Equality, and Fraternity” was painted; but the prices of admission to the Grand Opera were carved in the stone, as though they plainly said: “We only paint our patriotism on the walls, so if we desire a change in the government we can wash it out; but the price of admission to the grand opera can never be changed—*jamais!*” Again: when the revolution was over, the names of many streets and buildings were changed, all reference to royalty or the empire was swept away, till they came to the Palais Royal; this sacred title was not disturbed, as it was the name of the theater within its walls.

How grand I felt on my first visit, to think that I was in Paris; not the Paris of to-day, with its gilded domes and modern grandeur, but the old, quaint, dirty, gay, strange city in the early days of the Second Empire, with its high, toppling buildings, narrow streets, and lively people. What pride I should take, when I got back to America, in talking familiarly of well-known localities, and getting the French pronunciation pat and glib—rattling off the names with an easy air as if I had lived there for years. What boyish delight I felt in walking through the streets and looking in at the shop windows. Socrates, I think it was, who said, as he walked through Athens, “How happy I am that there are so many things here I do not want.” If his philosophy was correct—and I have no doubt it was—I must have been very unhappy and very unlike Socrates, for there were so many things that I did want. Of course I could not get them, but could price and admire them. Now I must be careful; the money had to be recounted, and there should be enough kept to get back with. I had been saving up two years’ salary for this trip, so there must be no undue extravagance. This matter settled, I filled my purse with gold, hired a cab, and sallied forth with my guide to visit the theatrical wardrobe shops in the Temple. I shall never forget this lovely day, wandering into the little dens, sometimes in the cellars, sometimes in the garrets of the queer old places, rummaging over quaint hats, square-toed shoes, character wigs, embroidered court suits, charming long silk stockings in all the magic colors of the rainbow, high boots, lovely gaiters, striped vests, and groves of old-fashioned liveries—it was a dramatic fairy-land.

IN THE SECOND-HAND SHOPS.

THE second-hand shops of Paris are very different from those of Chatham Street and Petticoat Lane. In London and with us they are presided over by thrifty Jews, who glare at you with glittering black eyes and thrust their eager noses in your face, almost imploring you to buy. Not so in France: quiet old women sit in the doorways of their shops, or just outside, sewing or knitting; no time is wasted by the women of France. They smile and nod as you pass by, but no rudeness, no urging you to buy; in fact, they seem so perfectly self-satisfied that at times it is quite provoking to the would-be purchaser. I was all eyes, and longing eyes at that. Now and then François would give me a gentle nudge and admonish me not to appear so anxious. At these times I would assume a careless manner as if such scenes were quite usual to me. At last François stopped in front of one of these shops: taking a survey with the air of a connoisseur, and nodding a cold approval of its contents, he invited me to enter. An old woman,—knitting, of course,—the exact counterpart of at least twenty we had already passed, followed us in. Here everything was in picturesque and artistic confusion—piles of curious costumes on the shelves, flowing scarfs, broad felt hats with ostrich feathers, russet boots, and big hilted swords and rapiers arranged in a half-careless, half-methodical way. There was an interior room from which issued sounds of merriment and laughter. I hesitated to pass through, but the old woman smiled and bade us enter, shrugging her shoulders and expressing in her way, "Only young people; they will have their sport." And so it was. Here were two sprightly young Frenchmen, evidently actors, and a pretty coquette of a girl—the daughter of madame—having a royal time at flirting and acting. For a moment our entrance damped their ardor and the "sport," whatever it was, came to a standstill. Then came some pantomime from my guide, who introduced me to the trio as an actor from America, at which they assumed an extravagant air of wonder and amazement, evidently guying me. So feeling themselves quite at ease, the merriment again proceeded. It was quite evident to me that there was a love affair between the pretty girl and the handsomer of the young actors. He was a graceful young fellow, with blonde, curly hair and blue eyes, and I presumed he was the rising young lover of some small theater in the neighborhood. The other actor was undoubtedly a low comedian of the same establishment. He was the reverse of the blonde lover, hideously ugly, with a turned-up nose, and a wide gash in the middle of his face for a mouth. He looked like a

monkey and was quite as full of tricks. Assuming a grotesquely tragic air, he grasped me by the hand as if I were his long-lost brother, then, pointing despairingly at the lovers, gave me to understand in pantomime that his life was blasted by unrequited affection. Then he fell upon his knees to the girl and implored her love; she laughed, of course. This started him to his feet, and with a sudden spring he picked up a Roman helmet, cocked it sideways on his head, seized a poker, and rushed upon his rival. Then he paused, and, bursting into tears, relented. Now taking the lovers' hands he joined them in wedlock, invoked a blessing on them from Heaven, stabbed himself with a poker, and rushed out into the front shop amidst the laughter and merriment of his audience. To me this seemed a very happy party, and though I understood very little of what they were saying, it was quite enough to convince me that some of their fun was at my expense. The old woman now led the way up a dark, narrow staircase to a room of wonders above. The walls were hung with fantastic dresses, spears, shields, and masks with decidedly French expressions of countenance. She pointed quietly to all these things, but rather disparaged them.

Now she came to a high, black leather trunk with a round top and clamped all over with iron bands and hinges. This contained glittering suits of Roman armor. A shining breastplate was displayed to tempt me. I explained that that style of thing was not in my line. So with a sweet smile, somewhat tinged with pity, I think, she shrugged her shoulders and passed on to a large, flat, wooden box like a monster sea-chest with an old-fashioned padlock on it, big enough for the Bank of England. She pointed to the box with admiration, as though she would say, "Ah, you don't know what lovely things are stored there, and so cheap." She first displayed a black court suit with polished steel buttons, very fine, but too large and too somber. Next came, a royal purple silk velvet one, embroidered with gold and foil-stones. I lost my heart to this at once, and the sly old woman knew it. I tried to look as if I did n't care for it, but failed. It would n't do with her. She saw through me, and began to fold it up with a loving hand, as though she could n't part with it for the world. She spoke no English; and as I was equally skilled in French, we talked through my guide. He, of course, professed to be on my side, but, from certain suspicious intonations, I fancy he slightly favored the old woman.

"Well, what is the price?"

"Five hundred francs." She said this with an injured air, as if she hoped I would n't give it, but of course I did give it.

One article after another was tried on; some reluctantly cast aside, others eagerly purchased. As each new treasure came into my possession it was placed in the cab by my guide. I did not want them sent home—no, I would take them myself; then I had misgivings that the cabman might drive off with my booty. I must have made François take his number three times at least, and put it in my different pockets, fearing I should lose it. At last I had gone through all the shops in the

Temple. The longing eyes of the old French woman followed me from door to door, the cab was full, the purse was empty, and now I had a feverish anxiety to get away. I was convinced I had bought these wonders at half their value, and I feared that the venders would regret having sold them, and before I could depart demand them back. So we jumped into the cab, gave the word, and drove to the hotel.

Three lovely weeks in Paris; it seemed like a dream. Then I awakened and sailed for home.

(To be continued.)

Joseph Jefferson.

WASHINGTON AND MONTANA.

HAVE THEY MADE A MISTAKE IN THEIR CONSTITUTIONS?

THE act of Congress providing for the division of Dakota into two States, and to enable the people of North Dakota, South Dakota, Montana, and Washington to form con-

stitutions and State governments and to be admitted into the Union on an equal footing with the original States, was approved February 22, 1889. On May 14, the electors in these Territories chose delegates to constitutional conventions which assembled on the Fourth of July following—the Montana convention in Helena, and the Washington convention in Olympia. For the first time was afforded the spectacle of four territorial conventions assembled on the same day to enter upon the labor of framing the fundamental law of State government. The Washington constitution of 1878 and the Montana constitution of 1884 were not sufficient to stem the adverse current of party politics in Congress.

In a peculiar sense the constitutional convention is an American production, and is composed usually of typical representatives of the interests of the people. Among the members of the Olympia convention were twenty-one lawyers, thirteen farmers, six merchants, six physicians, five bankers, four stockmen, three teachers, two real-estate dealers, two editors, two hop-growers, two loggers, two lumbermen, one preacher, one surveyor, one fisherman, and one mining engineer. Ten members were veterans of the civil war. The average age of the delegates was forty-five years, and the places of their birth were more than twenty-five in number. Ten were born in Missouri, eight in Ohio, seven in New York, seven in Illinois, five in Scotland, four in Pennsylvania, four

in Kentucky, three in Indiana, three in Germany, two in Tennessee, two in Ireland, and the remainder in Maine, North Carolina, New Brunswick, Massachusetts, Wisconsin, Ontario, Connecticut, Iowa, New Hampshire, Wales, Nebraska, California, and Washington Territory. The convention was composed of forty-three Republicans, twenty-nine Democrats, and three Independents.

There are men and women yet living who were a part of that company of a thousand souls who in June of 1843 gathered in the frontier village of Westport, Missouri, to set forth upon the weary journey of more than two thousand miles overland to an unknown country, Oregon. Its boundaries were still in dispute, its rivers still unexplored. Ten years passed and Washington Territory was formed from Oregon. In the next year Montana was given its present boundaries. The newness of the northwesternmost State of the Union is illustrated in the *personnel* of its constitutional convention: only one member of that convention was born in Washington Territory. That convention was in session fifty days; the Montana convention, forty-five days. On the first day of October following, the electors in each Territory ratified the work of their convention, and elected officers under the constitution, and also representatives to Congress. By proclamation of the President, Montana was admitted into the Union on the 8th, Washington on the 11th, of November.

The first noticeable characteristic of these new constitutions is their great length. The constitution of Washington consists of 27 articles, subdivided into 245 sections; the constitution of Montana has 20 articles, subdivided into 268 sections. Each constitution contains above 30,000 words. Each of the successive State

constitutional conventions since 1776—and there have been over 130 such conventions—has framed a longer constitution than its predecessor; and the constitutions themselves, having long since lost the simplicity of a statement of fundamental principles of government, have developed into a code.

This steady and complicated lengthening of State constitutions may be partly explained by the relative increase and complication of popular interests and rights which the fundamental law aims to develop, to guarantee, or to protect. There are other explanatory causes. (1) The jealousy felt by the people towards the executive in the time of the Revolution led to the introduction of many provisions limiting the power of the governor, many of which yet remain. (2) The transfer of power to the legislative department, and its swift assumption of other powers down to 1850, led to an increase in the number of legislative provisions of the constitutions. (3) Legislative assumption of power bred a revolution in popular sentiment, and the conventions called during the last quarter of a century have struggled to redress the possible evils of over-legislation, by the embodiment of an elaborate code of limitations on the legislative department. (4) The popular demand for the equalization of powers among three departments of government is shown in the attempt to define accurately the jurisdiction of each. A vast increase in industrial and other interests among the people has increased the burdens of the judiciary and compelled the creation of a somewhat complicated system of courts. (5) Popular distrust in popular government as administered by the "servants of the people" is manifested in recent conventions in their effort to control permanently the fluctuating forces of society, and to make a constitution which not only "should endure for ages to come," but should also anticipate the wants of generations yet unborn, and paternally relieve them of burdens not yet in existence. It has often been forgotten in constitutional conventions—and the conventions of Washington and Montana seem to have forgotten—that men and States change; that society is in a state of flux; that no constitution ever made in America has preserved its autonomy longer than one generation of men. The conventions have perhaps unconsciously confessed the law of change by providing for a means of future amendment, and the means of amendment has become simpler and will be more frequently tried with each succeeding decade.

The Washington and Montana constitutions embody in their bills of rights the provisions common to the constitutions of the other States, with some modifications or additions incident to geographical situation, economic condition,

or interpretation of civil needs. In Montana a grand jury may be summoned at the discretion of the district judge, and is composed of seven persons, five of whom may find a true bill. In Washington the number of the grand jury is to be fixed by law, but it is to be called at the discretion of the county judge. The debates in the two conventions show that objection was made to the "inquisitorial power" of a grand jury. In each State the petit jury varies from the type of the traditional jury. Its number, "to be fixed by law" in Montana, can give a verdict by a two-thirds vote. The number is twelve in Washington, but nine can give a verdict. In either State by consent of parties in civil cases jury trial may be waived. The right to trial by jury is secured by all State constitutions, but, little by little, the constitutions have introduced provisions by which causes may be brought to trial without the intervention of a jury, before the court, or before an officer qualified to preside in the case. The uncertainties incident to the jury system are slowly relegating trial by jury into a choice of methods, or into a respectable place in judicial history. In so far as legal practice is suggested by these new constitutions it is simplified, and the debates show the efforts of the conventions to make as plain as possible the course of the administration of justice. The constitutions are in this respect in happy contrast with the earlier constitutions framed a century ago. The technicalities characteristic of the English legal and judicial systems of colonial times were continued in our State systems long after many of them had disappeared in England. The lawyers who controlled the Washington and Montana conventions divided their conservatism with the radicalism of their colleagues, in which they were practically lost to view.

The provision against bigamous or polygamous marriages in Washington points significantly to a social evil of the times.

Montana is said to contain above fifty million acres of land that may be made agricultural by irrigation, and the provision regulating the use of all water appropriated for sale, rental, or distribution, in ditches, drains, flumes, canals, and aqueducts, is of vast economic importance in the development of the State. It suggests a new future for that country, which was described, somewhat summarily, in our school geographies, twenty years ago, as "the great American Desert."

Each constitution provides for a legislature consisting of two houses—a Senate, whose members are elected for four years, and a House of Representatives, whose members are elected for two years, following the model of the newer constitutions of the eastern States. The debates on the legislature brought to life

a sentiment which has lain dormant for a century, save by a semi-revival in the Ohio convention of 1850, and in the Illinois convention of 1870, that the State legislature should consist of one house. Georgia, Pennsylvania, and New Hampshire abandoned the unicameral system after a short trial of it. The Washington and Montana conventions examined the sentiment anew: the distinction between the constituency of the Federal Senate and the Federal House of Representatives, it was claimed, is lost in the States, because the members to the two houses are chosen by constituencies differing from each other merely in the number of electors. A house and a senate representing apportionments differing only by the census thus become a source of unnecessary and extravagant expenditure. In finally determining the organization of the legislature the two States proceeded differently. In Montana each county has one senator and no more; in Washington are senatorial districts, which may contain one or more counties according to population. Each State provides for representative districts, to be determined by the legislature according to population. Thus Montana follows the Federal Constitution in the creation of its legislative department. In each State the legislative term is biennial and for sixty days, but extra sessions may be called by the governor. The short session is the first limitation put on the legislature; the second is the provision against the introduction of bills—money bills in Montana—ten days before the day of adjournment; but the bill may be introduced in Montana by unanimous consent. Montana follows the provision of the Federal Constitution in the matter of the origin of money bills; in Washington any bill may originate in either house. In Washington the offense of bribery is left to be defined and punished by subsequent legislation; in Montana the legislation is introduced at once into the constitution. By each constitution a member who has a personal interest in a pending bill must disclose that fact, and refrain from voting on the bill. Above eighty specific limitations on the legislature forbidding special legislation are contained in the Montana constitution, and above forty may be found in the constitution of Washington. Since 1830 there has been in each constitutional convention an increase in the number of subjects over which the State legislatures are forbidden to legislate save by general legislation. The objections to this limitation are summed in the proposition that special legislation has become general legislation, and that such general legislation has made a vast amount of over-legislation. It is still an unsettled problem in statecraft whether a special law limited to a locality is worse than a special law limited to the State.

In both Montana and Washington there are eastern and western portions of the State differing remarkably in climate, productions, and interests. In a vast area like that of Washington it is doubtful whether the evils of general legislation are not greater than those of special legislation. A State of small area, or of a uniform economic condition, is best adapted to frame a fundamental law one provision of which might discourage "special legislation." The practical operation of this constitutional inhibition in Montana must produce a dexterity in legislation which even the legislatures of some eastern States might envy.

Both States provide for the quadrennial election of a governor, lieutenant-governor, secretary of state, state treasurer, state auditor, attorney-general, and superintendent of public instruction; Washington adds a commissioner of public lands. The demand for elective officers was early manifest from the mass of petitions to the conventions. No change in the American constitutions more clearly marks the triumph of an ultimate democracy than the provisions in successive constitutions for elective rather than for appointive offices. This demand ignores the difference between executive and administrative duties, and tends to make an almost endless chain out of the ring of political party supremacy. That the whole body of State officials should be made elective discloses a lamentable popular distrust of "all those in authority." The Washington convention further displayed the democratic tendency of the day by providing that the legislature at its discretion may abolish the offices of lieutenant-governor, auditor, and commissioner of public lands. Another tendency of recent appearance in constitutional conventions, to establish a commission rather than to confide responsibility to a single official, is shown in the Montana provision for a Board of Pardons, a Board of State Prisons, a Board of Land Commissioners, a State Board of Education, and a Board of Examiners of Claims against the State, the latter similar to the Federal Court of Claims. The governor of Montana may exercise the pardoning power provided that "the action of the governor concerning the same be approved by the board" of pardons; a provision which practically makes the governor's pardon merely recommendatory. The governor of Washington may exercise that power "under regulations prescribed by law," which provision practically puts the whole matter in the control of the legislature, where all experience shows it does not belong. Popular distrust of the executive was shown in the Washington convention by the effort to strip him of the veto power and to disqualify him, while governor, to be

elected a United States senator. This anxiety to keep the governor within the State indicates a remarkable change in American politics. The Federal Government was more than a quarter of a century old before membership in the United States Senate was more desired than governorship of a State. Now it may be safely said that, with the possible exception of that of New York and of Pennsylvania, the gubernatorial office is popularly considered far less in dignity and importance than the United States senatorship. John Jay declined the tender of the Chief-Justiceship of the United States and accepted the governorship of New York. His preference for a State office characterizes the public sentiment towards the States and the United States a century ago. But the political aspirations of politicians and of statesmen in this country have slowly shifted in a hundred years from office at the State capital to office at the capital of the nation.

In both the Washington and the Montana constitution is embodied a provision found by dear experience in both State and national affairs to be of great economic importance, that the governor may veto any item in an appropriation bill—a provision which is intended to prevent corrupt legislation. The proposition to abolish the veto power was lost in each convention. In the executive department the general provisions follow closely the Constitution of the United States.

In each constitution is to be found the supreme influence of the judiciary system of California adopted there in 1879—one supreme and three inferior orders of courts; justices elected for six years in the Supreme Court, and for four years in the County Court, called in Montana the District Court, and in Washington the Superior Court. The supreme court has appellate jurisdiction, and may issue original and remedial writs to complete the exercise of its appellate jurisdiction. Its writs run to any part of the State. The district courts (Montana) and the superior courts (Washington) have original jurisdiction in all cases at law and in equity. In Montana justices of the peace are elected for two years, and their jurisdiction cannot include cases in which more than three hundred dollars is involved. In Washington the original jurisdiction of the supreme court is limited to controversies in which the amount involved does not exceed the sum of two hundred dollars, unless the action involves the legality of a tax, impost, assessment, toll, municipal fine, or the validity of a statute. The California system tends to throw the burden of the administration of justice upon the courts immediately inferior to the supreme court. The conventions seemed to be satisfied with that system, although its

opponents showed conclusively its tendency to force the supreme court of necessity to be badly behind its own docket. In order to expedite judicial business both constitutions make provision for judges *pro tempore*, who are members of the bar, sworn to try the cases before them, and who render judgment with the same authority as a judge. Trials before auditors, masters, or referees are known to the judicial systems of many of the States. The Montana and Washington judiciaries illustrate in their short terms of office, in their abolition of special forms of action, in their elective judges and maximum of court days, the democratic tendency which now dominates in the formation of the fundamental law of a State.

The elaborate details and statutory character of these constitutions in their attempt at exact definition of official jurisdictions, and specially in the development of the articles on education, public indebtedness, finance, corporations not municipal, and municipalities, indicate the prevailing distrust of the people of the present American State, not alone towards the legislatures, but also towards all in authority under the constitution. The Montana and Washington constitutions are examples of "corporation legislation." A corporation is defined in language identical in both constitutions. The provisions which read like a corporation code are merely limitations on legislation; strokes on the heads of trusts and railroads and telegraph companies intended to affect the State legislature. Provisions concerning the voting of stock, the creation of fictitious stock, the consolidation of corporations, the discrimination in passenger and freight rates, the responsibility of corporations to their employees, the inability of employees to sign off their claim to the benefits of such responsibility, the regulation of prices by the formation of trusts, and the rights of one corporation to make use of the franchises of another corporation, are a few subjects of the legislative provisions found in both constitutions. The fine distinctions between solicitation and bribery, and the repeated reference to a corrupt legislature, in sections which declare the restrictions against infidelity in office, are a confession that public confidence in public officials is practically lost.

A constitution cannot rise above its source; nor can it stay the day of reckoning when the people must stand face to face with their own folly. The nearer a State constitution approaches a code the less does it maintain the character of a fundamental law, and the more certain will be the call for a new convention and a new constitution. The exact boundary between the constitutional convention and a session of the legislature is rapidly disappearing, and the people seem to be at loss whether

to have a new constitution every three years or biennial sessions of the legislature of sixty days each. The legislative character of the constitutions framed since the war points to the existence of a most dangerous evil in popular government. These constitutions in their large distrust of the integrity of public servants illustrate the folly of the attempt to escape the responsibilities of a free, popular government. The centralizing tendency in American politics of recent years has brought State politics and civil affairs into popular disrepute. Anybody can be sent to the State legislature and almost anybody to Congress. The political lesson taught by the constitutions framed during the last twenty years is that the purity and vitality of our system of government must be maintained, if maintained at all, by the State legislatures; when they fail the people then the very axle of civil power is broken. The almost countless limitations on State legislation incorporated into recent State constitutions are a solemn confession of the decadence of the people themselves. The character of State legislation is the chronicle written by the people of the State. At present neither the emoluments nor the honor of the office attract into the State legislatures even the better class of men. Private enterprise brings far greater reward and honor. State politics in this country are notoriously corrupt, and the people, complaining, wonder how such evils can exist. The conventions of Washington and Montana have simply repeated the constitutions already in force in this country which most nearly approach a code.

The laborious and honest efforts of delegates in convention to frame the fundamental law for a new State are not to be lightly passed as a tri-

fling incident in perennial politics. These constitutions are peculiarly in evidence in the case of *The American People versus Themselves*. Unconsciously have these two new States solemnly entered upon that wearisome and disappointing course which has been already run with error and regret by many of the older States. The northwestern States cannot avoid the evils of civil life by incorporating into their fundamental law the elaborate and repeated proofs of the distrust of the people towards those who shall be elected to conduct the State government. It is plain that these conventions lost the opportunity to remedy the acknowledged evils complained of by the people of some of the older States by making a simple, organic law and putting power and responsibility in the hands of those to whom the control of civil affairs is to come. A constitution cannot make a State. Each election makes or unmakes the American commonwealth. One of our recent English critics has wisely written: "To the people we come sooner or later. It is upon their wisdom and self-restraint that the stability of the most cunningly devised scheme of government will in the last resort depend."

A cursory reading of the constitutions for the northwestern States might suggest to some the vision of an ideal system of State government duly anticipating and providing against those evils which long experience in the eastern States has repeatedly chronicled with shame in volumes of statutes and session laws; but upon a more mature reflection on these instruments, and an examination of the times in which we live, we are compelled to confess that the conventions in Washington and Montana framed a legislative code rather than a body of fundamental laws for the new States.

Francis Newton Thorpe.

BLOMIDON.

THIS is that black rock bastion, based in surge,
 Pregnant with agate and with amethyst,
 Whose foot the tides of storied Minas scourge,
 Whose top austere withdraws into its mit.
 This is that ancient cape of tears and storm,
 Whose towering front inviolable frowns
 O'er vales Evangeline and love keep warm —
 Whose fame thy song, O tender singer, crowns.
 Yonder, across these reeling fields of foam,
 Came the sad threat of the avenging ships.
 What profit now to know if just the doom,
 Though harsh! The streaming eyes, the praying lips,
 The shadow of inextinguishable pain,
 The poet's deathless music — these remain!

Charles G. D. Roberts.

FRIEND OLIVIA.

BY AMELIA E. BARR,

Author of "Jan Vedder's Wife," "The Border Shepherdess," "A Daughter of Fife,"
"The Bow of Orange Ribbon," etc.

VII.

DE BURG'S FIRST MOVE.

"Find me a reasonable lover against his weight in gold."

"Upon my word, this day certainly has turned out both perverse and adverse."

"If a woman has any malicious mischief to do, in that case her memory is immortal in remembering it."

"To do good to the bad is a danger just as great as to do bad to the good."

THE day after this event Nathaniel made a visit to Sandys. It was now summer, but he remembered so well the early spring when Olivia Prideaux had come to him as the living breath and spirit of the time. No one notices the seasons like a lover. As they balance their flight on the swift wings of night and day he makes all their changes and events a sweet calendar of his hopes and fears. For him there is then a mystery in the air, filling it with a strange sensitiveness; the sunshine is something more than the light of common day; the linnet's sweet babbling, the humid flash of the trickling stream, the white butterfly's rhythmic measures, the stillness of the summer noon, the snow-clad hills of winter, every fair thing in the earth below, or the firmament above, is but a fresh spelling of the beloved one's name and excellences.

Nathaniel found Sandys open to the sunlight and perfume of the garden. Roger sat at his desk, but the desk was so close to the lifted window that the roses almost touched his face and hands, and the birds, twittering secrets in the ivy above them, might as well have been in the room. He was counting moneys and casting up expenses, doing the business with methodical thoroughness, yet not insensible to the sweeter and fairer things around him.

He lifted his eyes to the young man and they had a welcome in them. "I am glad to see thee, Nathaniel. Thy last visit was such as might have asked another ere this."

"I like not to talk over evil which is past.

Let us not speak of the man who troubled you. He is gone."

"I know not; the great events of life are always surprises, Nathaniel."

"Surprises are what Mr. Baxter calls 'god-sends,' and seeming good or seeming ill, they are still 'god-sends,' and not to be mistrusted."

"True. All things are done well in the ordering of unerring wisdom; and God's ancient promise, 'As thy days so shall thy strength be,' fits every occasion, joyful or sorrowful. Yet I confess to thee that I have a strange necessity upon me in regard to my affairs. I have had warnings to set my house in order; yea, I have cause to believe that there is some great change coming. And this apprehension of duty has been on me for some time. But I leave all to God, and in this feeling I center my soul."

"Roger, will you give me Olivia for my wife? I love her with my whole heart."

"There is but one holdback in my mind; thou hast not yet joined the cause of truth, Nathaniel."

"I have not yet felt clear to do so, Roger, and without this assurance —"

"Stand still. No man can by searching find out God. Only be willing, and he will find out thee. Yet I think surely thou art not far from the kingdom; and in the matter of Olivia, speak to her. She shall lead us both."

Then with a heavy heart he dropped his head over his book and resumed his calculations. He could ask no better husband for his daughter, and personally Nathaniel was very pleasant to him; yet he sighed heavily, and the pang of renunciation was exceeding bitter. This is the way with all earthly desires granted—always the something lacking, always the something taken; and though Roger was well pleased that Olivia should be Nathaniel's wife, he could not contemplate without heartache the days which had been and which soon might be no more; the sweet, calm, loving days wherein he had been everything to his child—father, mother, lover, and friend. But he said nothing of his own loss, and Nathaniel stopped not to consider it.

"Where is Olivia?" he asked, with trembling eagerness, and the pathos of the father's voice and attitude was lost in the simple satisfaction of his reply:

"An hour ago she went into the garden."

It was an old-fashioned garden full of turning walks hedged high and close with privet and hazel bushes. Narrow beds bordered with box ran under the hedges, holding all the sweet fragile blossoms that love not the hot sunshine. In an angle of one turning there was an arbor cut in the thick green wall of privet, and there Nathaniel knew he would be most likely to find Olivia.

He had a rapid, decided step, and doubtless she heard him coming, yet she kept her eyes dropped upon the exquisitely small stitches she was sewing. She was dressed in white, but the sunshine sifting through the green roof of the arbor threw over the spotless lawn indescribable rays of palest green shot with gold, melting into each other, changing, passing away, like the tints of the sky at evening. A large, handsome cat slept at her feet, but it in no way detracted from the peace and freshness and sweetness of the living picture.

"My love, my dove, my undefiled!" This strain of the sacred canticle came into his heart and tasted sweet upon his lips. He said it over and over as he approached the girl, and perhaps in some mysterious way she felt the influence of the winged though voiceless words, for her face was covered with a rosy light, and her eyes were so full of her soul that the radiance from under the dropped lids left a glow upon her cheeks.

He had purposed to say many things in preparation of "the words." But when the heart is ready to speak it needs no introduction, and before he was aware he had said them. He took the work from her hands and clasped her hands in his own. He drew her close to his side, and told the heavenly story of a heart which has found the soul it loves. The low words, the embrace, the kiss that spoke where all words failed, went to Olivia's heart as the sunshine to the heart of a flower, or the sweet, soft rain to its root. In that hour Nathaniel revealed her to herself. He interpreted the unknown language of her wistful longings. He claimed her by some inexplicable but indisputable right for his own, and with shy, trembling happiness she acknowledged the claim. So for a little while these two blissful mortals found their lost Eden.

But it is in such hours that we all realize how impotent is the language of earth. Though moved to more than earthly rapture, they had nothing to say worthy of their emotion. Foolish as the babbling of babies is the talk of lovers, but it is a folly springing from a divine depth — a depth which no plummet of wisdom has sounded. The oft-repeated words, the words half spoken, the questions asked with a look, the questions answered with a kiss, the vague,

glancing, broken language of lovers! Is it not as eloquent and as wise in its foolishness as that sweet baby prattle which between a mother and her child is wiser than all wise words? Never till the soul is free from fleshly bonds shall we tell the beloved how truly we love. Never on earth shall we speak perfectly the language of heaven. We can but stammer, and blunder, or ask from silence the pathetic interpretation of our mute souls. For the words we learned before we fell a little lower than the angels call to us in vain, our tongues are tied, and though we strive to syllable the memory, we find, alas, that there is no common speech for the body and the soul! Language fails when we need it most.

But whether in speech or in sweeter silence the afternoon sped on. The sun sunk lower and lower, and with slow steps the lovers began to tread the flowery lane. Nathaniel pulled some violets and put them into Olivia's girdle. It seemed to him a wonderful thing to do. A week ago he only dreamed of such delight. A little farther on they came to the open garden where the perfume of raspberries and the double velvet-roses mingled, and the warm, light wind brought them a caress of scent,—the soul of a red bergamot flower,—and the clove carnations filled the air with their enthralling odors. They forgot that they were mortal, since as yet no thought or care for the future came with anxious whisper between them.

Nathaniel had fully determined not to speak of John and Anastasia de Burg. In his heart there lay that singular superstition which at some time or other has influenced the most pious and logical minds, a feeling that it would be wise not to name the evil dreaded lest they might call it unto them. Yet in defiance of this resolution, in a moment, without intent, he broke it. A sudden chill and silence followed the ill-omened words, and his heart instantly reproached his tongue for them.

Everything changed in a moment. The hour of enchantment was over, and they were summoned back to common life by a shrill, weak voice calling at its highest pitch:

"Olivia! Olivia!"

The two words were full of anger, of terror, of some nameless dread, which the girl felt without understanding. She looked with fearful inquiry at Nathaniel, and, dropping his hand, hurried to the house by the nearest path.

It was Asa calling her, but his voice was so changed that she did not know it until she saw him standing in the open door. Without a word he went before the lovers into the parlor. Two strange men were there, and Roger Prideaux stood between them with irons on his wrists.

Olivia was at his side in a moment. She kissed his bound hands, and put her arms around his neck, and comforted him with that sweet love which, without saying 'What is the trouble?' thinks only of consoling it. It was Nathaniel who made the inquiry. With his hand on Roger's shoulder he asked:

"Under what warrant do you serve an honorable man so hardly?"

"High treason, Captain, and no less."

"Nathaniel, my son, neither make nor meddle in this business. I have a narrow path to pass through, but One goes with me able to deliver."

"My father, trust in him!"

"Though he slay me, yet will I trust in him.' Turn thee, dear child, to Romans, eighth chapter and twenty-eighth verse. There I found, not ten minutes ago, God's grand charter of help sufficient. I was reading it as the officers crossed my threshold, and the page shone with the glory of the promise."

Upon this scene the men not unkindly turned their backs, and Asa served them with a flagon of ale and some meat and bread.

"Nathaniel! Thou wilt care for Olivia?"

"With my life."

"My dear heart, I give thee to Nathaniel; for I go I know not where, nor for what time. Yet if it stand with God's will, I shall surely come back to this pleasant home; and if it stand not so — his will be done." He looked wistfully round the room and into the garden, and then bent his head and kissed the sweet, white face that lay upon his breast.

"Neighbors, I am ready. There is a long walk to Kendal, and delay at this hour can do no good."

There had been no outcry, no clamorous grief. The thing they had feared had happened to them, but they were prepared to receive it. Roger had not only set his house in order, he had also made Olivia conversant with all his affairs. So they said farewell with the noble calmness of pious souls; for piety is self-government in its highest form. Olivia pressed her white cheek against her father's, showing him eyes full of holy hope and trust. She touched his lips with lips wearing the calm smile of a soul trusting in the Omnipotent.

She went with him to the door, Nathaniel and Asa keeping, with a natural modesty, a little behind her; for the nearness of her grief gave her a sad preëminence. She stepped outside the threshold on to the wide flags which made a central path through the garden to the park. On each side banks of roses filled the senses with their color and scent. A laburnum tree dropped its golden racemes above her head, and the westering sun made the broad, tranquil

atmosphere look as if it were filled with gold-dust.

She stood in it a slight, white-robed figure, tearless and speechless, but revealing in her face and attitude feelings inexpressible; unless it were possible to compass that vast, enigmatical language which comes in dreams. A calamitous constraint of circumstances, a strict necessity, was subduing her; but she resented sorrow, as youth must ever do. She knew that Anastasia was triumphing over her. If the blow had come from the blind prejudices of the civil power she could have borne it better. She felt it hard that her father should have to go to prison for the crimes of John de Burg and the wicked jealousy of his sister. Hardest of all was the thought that God had permitted Anastasia to cross the threshold of their happy home and bring misery and ruin with her. Quiet as Olivia seemed to be, a great storm tossed her innocent soul. She wanted to be alone, to weep, to cry out, "My God, why hast thou forsaken us?"

But she had that in her which rung well to the striker. Though every footstep on the flagged walk was like a blow on her heart, it was a blow that stirred her into keener life. She whispered obedience, and, with head inclined, inclined her heart.

Standing thus, she watched her father pass out of her sight. He walked like a man who had put the world away from him; who held it as indifferently as if it were a cast-off shoe. The irons on his wrists were unfelt, the road seemed to go upward to heaven. Holy men of all ages were on it with him. He saw with Stephen, he heard with Paul, he communed with God, and had such comfort and strength as this world knows nothing of. And at this hour Roger Prideaux, though small in stature, looked truly noble. The officers instinctively fell behind him a few steps. They declared afterward that his face shone and that they feared to be with him.

Presently the great trees hid all of them from sight. Then Olivia turned her eyes upon Nathaniel, eyes soft shining through a haze of unshed tears. He raised her hand and kissed it, leading her with tender, comforting words into the lonely parlor. For a few minutes she yielded to herself, to her human need of sympathy, to her woman's need of love and strength. But soon the primitive courage of her soul rose above its weakness. She withdrew from Nathaniel's embrace, she stood upright and looked around like one who is gathering force from every quarter.

"Asa!"

"I am here, Olivia."

"Thou must tell Gideon to saddle a fleet horse. He is to go to my aunt Hannah Met-

telane, who lives at Ambleside, and tell her that 'the time spoken of has come.'

"Thou art sure thou art doing right?"

"It is the word of my father, Asa. As to thyself—"

"I am ready to do to the utmost."

"Then put up some changes of clothing for my father; thou knowest all he will want. Surely thou wilt stay close to him, Asa?" And she went to the old man, and took his hands in hers. Their eyes met, and he gave her an inviolable promise.

"He will miss thee at every turn. Be hands and feet to him. Be a friend to him, Asa. He hath been one to thee, and now there will be many against him."

"I will go to thy father. I will never leave him so long as he is in trouble. And take courage, Olivia. In a deluge, God's children never miss the ark."

"God give thee a good reward, Asa." Then she turned to her lover. "Nathaniel, I must go to D'Acre Hall at once. My father has a right to think that Edward D'Acre will prepare such bail as may be wanted, if it come to a question of bail. He left a letter on the subject, which I must deliver."

"I will take it for you, dear Olivia."

"Nay, my father will not have thee meddle in this matter. Also, I have a message which is to be given, or not given, in my own discretion."

"Until your aunt arrives, or so long as you desire it, I shall look for you to stay with my mother. If I take you to D'Acre to-night, you can rest there, and so come on to Kelderby to-morrow."

"Jane D'Acre is my friend. To get security is not a thing of 'ask and have.' I may be required at D'Acre for more than one day, and I think surely that Hannah Mettelane will come with all possible speed. Also, dear Nathaniel, thy mother might not desire my presence. I must be certified of her good-will ere I put so great a demand upon it."

"My beloved! Are you not as my wife? Is not my home your home?"

"In so far as thou canst give it. But thou must not trespass on the rights of thy father and mother, nor must thou lead me into so great a snare. Jane D'Acre is my friend; I will go to her." She spoke with a not unsuitable maidenly pride, feeling that it was Lady Kelder's place to give her first some unmistakable evidence of love and welcome.

Nathaniel was full of sorrowful and wounded perplexity. He knew well how unwelcome Olivia would be at Kelderby. If he took her there, a kind of civility would not indeed be denied her. The baron would be gravely courteous, and Olivia would doubtless soon

win from him a warmer feeling. But Lady Kelder would be more unreasonable. She would probably retire into her own room and refuse to see Olivia, or, if more aggressively inclined, Nathaniel understood in how many ways women can wound women, smiling as they do it—saying cruel things that defy answer or reproof, insinuating wounds which the victim can only bear in silence and hide from every eye.

He walked restlessly about the room, miserably conscious of his inability to give the girl he so passionately loved the shelter and help he longed to give her. She passed in and out frequently, as she made with Asa the preparations necessary for her father's comfort and the security of the house. But Asa was both by nature and education deliberate in all his movements, and he considered the present circumstances demanded, not less, but more, than his usual careful attention. There were presses and cellars and awmeries to lock; servants to instruct; Olivia's special charges to provide for; so many little things to direct that it was after sunset before she was able to leave Sandys for D'Acre Hall.

She made no complaint about it. The pallor of her face, the sadness and subdued anger of her manner, alone told the story of her suffering. And Nathaniel showed how well he understood the girl he loved, by his sympathetic silence. She had entered the house of sorrow, and he did not walk at her side babbling and questioning and lamenting, but Olivia felt at every step how truly his love enfolded her.

The long twilight of the season soon became gray. All glory went from the horizon, all color from sea and land. Evening has strange sadnesses, melancholy tints and tones, pathetic intimations which the sensitive soul solemnly apprehends. The lonely road they traveled was void of all counteracting influences. It wound in and out among the boulders of the misty heath. The sea was at their right hand—a gray, heaving mass, uttering a mournful, sighing roar, and half hid by a veil of drifting vapor. Yet only a few hours before the world had been so full of light and color, of song and scent and warmth. Now to the silent lovers it was a lonely, sterile world, full of mystery and gloom and strange ominousness.

They arrived at D'Acre Hall just as the twilight became night. D'Acre stood on his door-steps taking his farewell look of the day he was going to shut out of his house. He was startled by the arrival of visitors at that hour, but when he recognized Nathaniel and Olivia a look of confirmed expectation crossed his face. It was as if he had said, "I was sure this would happen." He called his wife, and

in a few moments Nathaniel saw Olivia kindly received by her friend. She turned to him one moment before she entered the house, and he lifted his hat and bent his head in reply. It was the only assurance either of them needed. They loved, they trusted, they even dared, dark as the hour was, to hope.

Nathaniel did not alight. He had a long ride, and he was little inclined to talk to any one until he had consulted with his father. But it was necessary to explain Olivia's position, and he did this with as bare circumstance as possible. D'Acre, standing in the gloom with his hand upon the horse's neck, heard him with a troubled face.

"So much does not astonish me, Captain Kelder," he answered; "I pray God it go no further. For you must know that I was in Kendal yesterday, and I heard De Burg very loud and insolent on the matter."

"I doubt it not."

"Squire Garnet, and Thomas Musgrove, and Isaac Sandal were talking with me, and De Burg, coming up to us, cried: 'This is a foul business! Here am I, a gentleman of honor and descent, put under bonds and made but a lodger in mine own house, because I stand for what it would have been treason and death for my father not to have stood for; while that Quaker malignant called Prideaux is let live at his ease, though he be plotting in broad daylight against your Commonwealth'—and a deal more of the same sort of words, but mainly that Prideaux had been harboring Harald Sandys, who was Charles Stuart's emissary to the English Quakers; and hearing that, I went away, for truly I believe the matter to be so."

"Harald Sandys is dead."

"Nay then, I know not what to think. Surely Roger Prideaux came to me for a suit of clothing for Harald Sandys, and I deem him too true a man to lie to me. And herein I am myself uneasy in the matter. It is most likely I may be hardly dealt with if my kindness be construed into giving aid to a traitor."

"Is it needful to speak of it? Prideaux will never do so."

"Alas, I have already talked with one who, I fear, will be easily moved to repeat my words. For meeting Phillipson one day,—and I know not when I have met him before,—we fell into talk about Sandys, and the end of so old a family, and the pity of it; and further, Phillipson said he had been the dearest friend of the late lord, and loved him. And out of a good feeling I replied there was a certainty that one of the Sandys yet lived, and also that he was deep in Charles Stuart's counsel, and would be like, if changes ever came, to build still higher the house of Sandys. And one thing brought the

other, as it ever does, and I fear that I have done wrong not only to myself but also to my friend. Surely, surely, the 'yea' and 'nay' of the Quakers is all of tongue traffic a man can manage with safety and without sin."

This confession greatly troubled Nathaniel, tossing his mind to and fro with indeterminate fugitive fears and suggestions as he galloped home. Indeed he was so thoroughly occupied with them that he failed to conceive the different temper of minds not as yet possessed by their demands, and the baron's and Lady Kelder's cold and constrained interest in his return seemed to him most unkind. If they had met him with eager questioning and exclamations he would hardly have wondered or inquired, but that his father should placidly resume his book, and his mother her spinning, as if Roger was not in prison, and Olivia not a fugitive from her home, was in his present concentrated mood a real wrong to him.

"There is great sorrow at Sandys," he said, with an air of injury.

The baron dropped his book, and Lady Kelder stayed her wheel.

"Roger Prideaux is taken to prison on a charge of treason against the Commonwealth. De Burg has informed the authorities that he was sheltering royalist emissaries—in fact, Harald Sandys."

"He is well served. The old Quaker must turn patron to gentlemen in his old days, and now he has to pay the price of tampering with gentlemen's business. Faith! I cannot afford to be sorry for him."

"But this is a business, Joan, which if possible we must afford to help. What is the first thing, Nathaniel?"

"Bail, if admissible."

"Bail! No more of that, I pray, Odelin."

"Indeed, I fear it is beyond me. Kelderby is fully pledged for De Burg, and over Swaffham I have no power. Where is the young girl?"

"I left her at D'Acre's, but she hath no right there—if my mother would but offer her—"

"She hath no right here."

"She hath the right of my promised wife."

"Nathaniel!"

Lady Kelder rose with the word, and passionately pushing her wheel aside she said:

"Dare you tell me that again?"

Mother and son looked steadily at each other; there was no flinching in either face.

"She hath the right of my promised wife."

"When you tie that knot, you may tie cobwebs. And, while I am mistress of Kelderby, Olivia Prideaux crosses not its threshold."

"I am sorry you cannot feel as I do in this matter, mother."

"Sorry! No, you are not sorry. You have

known my mind about the Quakers, male and female, long before you met this girl. You wanted her because you were bounden by every sacred duty not to want her. Faith! if 't were not Adam pulled the forbidden apple, 't was because his courage went not so far as his desires."

"Joan, my dear heart, fret not yourself beyond your guidance. Nathaniel hath done wrong—"

"He hath done a cruel wrong, the cruelest wrong a son can do to the mother who bore him."

"Mother, have I not the right to choose the woman I love for my wife?"

"Son, have I not a right to say what woman shall be my daughter? Have your father and I not a right to say with what family we will blend our own family? Who gave you permission to mingle Quaker blood, and trader's blood, with the strain kept noble and honorable through seven centuries? A boor, a lackey, may live unto himself, but you! You have no such cursed privilege, sir!"

"Indeed, I think the Prideaux may stand in all honor beyond the De Burgs."

"Nathaniel, my mother was a De Burg."

The baron spoke with unusual sternness, and then crossed the hearth and took his wife upon his arm. "I am afraid, Nathaniel, that your visits to Sandys have already done you much mischief."

"I am prepared to meet it. I shall suffer with Olivia."

"// "Do you see nothing beyond yourself, sir? Your suffering, your shame, can you bear them alone? No, your mother will have a double portion. And I think you might also respect your father's honor and not wound your father's heart. If you are mixed up with these Prideaux, I too shall be under suspicion. My friends will look coldly upon me. My enemies will shoot out the tongue and say slanderous things. I shall lose my eminence among the Independents. Indeed, there needs no more to all our undoing than such an alliance."

"I think I am doing right, father."

"Nothing can be right for yourself which is procured by wronging your father and mother."

"Roger Prideaux is innocent, and I think it will be proved so. If not, whatever is God's will he can bravely bear it."

"God's will! That is easy said, Nathaniel"; and Lady Kelder flushed with indignation as she spoke. "It is presumptuous to ascribe all that happens, however wicked it be, to God. God *permits* both the devil and men and women to do many things that he does not *will* them to do. There is a difference—yes, a

great difference. God may permit you to make a selfish and cruel marriage in order to gratify yourself, but he does not will or wish you to do it."

"I love Olivia; she hath the promise of my hand—a promise I will not break. The future holds miracles; if I keep faith with my love, I doubt not but what truth and patience will conquer in the end."

"You are wonders, of course, both of you! Nothing has ever happened to your fathers that has happened to you. Nathaniel, you are a very ordinary young man, and Mistress Prideaux a very ordinary young woman. Let me tell you that the earth will not move off its axis, nor its inhabitants be turned upside down, to compass your marriage with—a Quakeress!"

This closed the argument for the night, but it was renewed next morning on a different basis; or rather Lady Kelder refused to see, or hear, or feel anything touching the subject. Her own mind was made up, and she was determined not to permit discussions which could only give her pain, without touching even the outermost edge of her convictions. She disliked Olivia, though she had seen her but twice; and what argument can conquer a soul's involuntary antipathy?

Olivia's serenity, her unassuming modesty of garb and manner, her peculiar form of speech, were all affectations to Lady Kelder. Besides which, she had an abhorrence of Quaker doctrines. Extreme Calvinism had molded her spiritual nature; its austerity and intolerance made the boundary lines of all her ideas. She had received from Mr. Duttrede as well as from Nathaniel an account of the Fox meeting at Roger Prideaux's, and had felt scandalized at Olivia's interruption of a grave theological debate. These emotional young girls, who talked of an indwelling Christ, and of heavenly visions, inspired her with no other feeling but that of dislike. She was angry at such presumption. The revelation of heavenly things unto babes, instead of unto priests, was a doctrine she did not practically admit.

In the solitude of the midnight she had sat alone with her soul and conscientiously examined her motives. And she was sure that Nathaniel's marriage with Olivia would be a most unfortunate one for her son. A Quaker wife would separate him from all their old friends and associations. Unless Nathaniel became a Quaker, there would be a divided household in religious matters. If Nathaniel became a Quaker, the remedy would be worse than the disease. In that case he would also be practically shut out from all civil offices and from all social respect. His fine position, his ancient prestige, could be used only for the

spread of Quakerism. Spiritually and temporally, in her opinion, the alliance meant ruin to her son.

The baron shared her opinions, modified somewhat by a more comprehensive and masculine grasp of the subject. "If Quakerism is not of God," he said, "it will speedily pass away, and Nathaniel hath so much sense as to discover this." He reflected also that Olivia's peculiarities would probably be softened by the social and domestic demands of life at Kelderby, and that even if they were not, the estate of Sandys was a very fair set-off against religious opinions which in some respects his own experience justified. Still he was not inclined to encourage the marriage; he believed truly it would be neither happy nor prosperous.

After breakfast father and son took a walk, in order to talk more freely about the situation of the Prideaux and the extent of danger likely to touch Kelderby in consequence.

"I think it is but a woman's passion," said Nathaniel. "Anastasia has no continuance of purpose, either in good or in evil."

"Herein you judge foolishly, Nathaniel. Anastasia, by her first movement of revenge, has put the matter beyond her own control. And D'Acre's report shows that Stephen de Burg has lifted her cause. In some way or other, it is his intention to make this an occasion for a quarrel with me. Then — you can see what will follow."

"He and Anastasia will go to Charles Stuart, and you will have the forfeit to pay."

"Also, I myself may fall under suspicion with the Commonwealth. Judges who look beyond the day will argue that De Burg, being my cousin, and a man of such reputed honor, would not so wrong my kindness unless under some secret agreement of mutual interest; and the natural suspicion will be that it refers to the return of Charles Stuart. Nathaniel, I am in a very hard case. I pray you do not strengthen ill thoughts by a friendship and alliance with that Quaker, who is already doubted in his loyalty."

"We know, father, that the man was John de Burg, and not Harald Sandys."

"We do *not* know. Your apprehension is not confirmation to any mind but your own. Also, you must plainly perceive that Prideaux entertained the man believing him to be Harald Sandys, and, on his own confession, 'about the king's business.' Nor will it help him to say it was John de Burg, while it may make my cousin and Anastasia so much more our enemies."

"Still if asked, I must tell the truth."

"If your conscience demand so much — yes."

"As for my promise to Olivia —"

"It must be set aside. All promises depend upon the power to perform them."

"I have the power to perform this promise."

"Not without committing grave wrongs to your mother and me. A promise kept under such circumstances is worse than broken."

"I have an obligation to Olivia, and also to Olivia's father. I cannot break it."

"You have an obligation far older and more sacred to your mother and to your own father. Do not dare to break it, lest you lack God's blessing on all else."

"Is it not said that a man shall leave father and mother for his wife?"

"It is said they '*shall*' do so. But it is not said that they '*ought*' to do it. It is also said that men '*shall*' deny God, and persecute the saints, and commit all manner of sin. Your mother said truly last night that many things are permitted of God that are not of God's will. Let me tell you that a life of self-indulgent love will smart as death. There is always a way to reconcile duties, if men will patiently take counsel of God and put away the spirit of self-serving."

Nathaniel's answer was interrupted by the approach of an officer, with a summons for Nathaniel Kelder to appear before the Kendal magistrates on the following day, as a witness in the complaint of the Commonwealth against Roger Prideaux. And in further conversation with the man it was ascertained that Olivia Prideaux, Asa Bevin, John D'Acre, and Stephen de Burg with his daughter Anastasia had also been cited. He stated further, that the examination was likely to cause great excitement, and to be attended by many sympathizers on both sides.

The news, though expected, was startling. We think we have prepared ourselves for an event, but we never have. Its arrival is always a shock. Both men dreaded the camp of gowned conflict. Both men would far rather have buckled on their swords and gone to the battlefield for the Commonwealth than enter those treacherous lists.

"But the evil we have called unto us," said the baron, with a sigh, "we must face."

"Well, then, father, the good man stands under the eye of God, and therefore stands. Courage carries the day, and love won't fail us anywhere."

For Nathaniel had one of those souls born for adversity, which win from it the strength to nerve themselves for the loftiest endurance or endeavor —

E'en as the falcon when the wind is fair,
Close to the earth on lagging pinion goes;
But when against her beats the adverse air,
She breasts the gale, and rises as it blows.

VIII.

THE KING'S SERVANTS.

"He who deceives by an oath acknowledges that he fears his enemy, but despises God."

"Like to a sea-girt rock I stand,
Deep sunk in peace though storms rage by,
As calm as if on every hand
Were only Thou, O God, and I!"

WHEN Nathaniel awoke the next morning he had a moment's wonder as to where he was. For the brattle of sweet-tongued bells clashed and clanged in the sunny air with a joyful melody. He leaped up to the exultant octaves, his soul, independently of his will, setting them to the musical old chime —

O! te laudum millibus,
Laudo! Laudo! Laudo!
Tantis mirabilibus,
Plaudo! Plaudo! Plaudo!
Gloria sit gloria,
Domino in altis;
Cui testimonia,
Danter et præconia,
Cælicis psaltis.

There is a kind of compulsion in such familiar rhymes, the mind perforce goes through them; and yet before the charming words were half recalled Nathaniel had suffered a sudden depression. The old question, What is the matter? deadened the last lines, and they sung themselves mournfully out of his consciousness.

He had left Kelderby for Kendal on the previous day immediately after receiving the summons, and had spent the night in the Crown Inn of that town. With the recognition of this fact came the instantaneous memory of all the unhappy circumstances which had brought him to the unfamiliar room. And he was compelled to acknowledge that Roger's affairs were capable of being worked to much loss and sorrow. He had found him so strictly confined that it was impossible to get speech with him, and the general opinion was adverse to his case.

He was also troubled about Olivia's position, for on his way to Kendal he had called at D'Acre Hall, and found that D'Acre had retreated into the safest lines of popular approval. Olivia was constrained and unhappy. She felt the chilliness and anxiety of her entertainers, and she regretted having left the fortress of her home.

D'Acre being also summoned, it would have been in friendly accord with the circumstances to have detained Nathaniel until the morning, or else to have accompanied him to Kendal without further delay. But D'Acre did not wish to be associated with people suspicious

in the public eye. The charge of Olivia annoyed him very much, and he thought it would be a wrong to his young wife to have her seen with the girl. He did not indeed say so, but Nathaniel had one of those souls which see our human nature behind the veils of Eleusis. He understood the sickness which would prevent Mistress D'Acre going to Kendal with her guest; he felt the frosty hospitality, the bareness of sympathy which wounded and repressed Olivia, and he was glad to hear her say:

"If God will, I shall go back to Sandys to-morrow."

"You will do right, Olivia. Sorrow should bide at home."

"I think so," answered D'Acre, who was nettled by Nathaniel's tone more than by his words. "If a man can salute his own special troubles, he does as well as flesh and blood can do."

"True, D'Acre, if flesh and blood were all."

There was such sadness in Nathaniel's voice that D'Acre did not word the quick answer he had ready. For we are complex creatures, and if it be true that when we would do good evil is present with us, it is equally true that often when we would do evil a good thought or a kind feeling restrains the evil.

Nathaniel dressed quickly, with a certain careful splendor, and he was still young enough to eat heartily, though Anxiety sat down at the table with him. The sky was without a cloud; the sunshine filled the streets; the bell-ringers kept up their happy riot of exultant melody; the shop-keepers stood with broad, beaming faces at their doors; the women were at the open windows. For it was pretty Mary Pierson's wedding day; and because human nature never wearies of its prime elementary feelings, the wedding peal found some echoes in nearly every heart.

Nathaniel walked slowly through the clean white streets: the wedding was over, but men and women still stood together talking about it. He went thoughtfully forward until he had passed the parish church, then turning he saw Parson Derby just leaving the rectory, and Stephen de Burg was with him.

The examination was appointed for eleven o'clock, and before that hour a great number of people were in the Town Hall. The wedding had broken into the day's work, and the trial of Master Prideaux was more attractive to them than their belated tasks.

When Nathaniel entered it, his first glance fell upon Olivia. She sat near the bench for the magistrates, a little apart, and quite alone. D'Acre had brought her thus far, and then found in his own affairs an excuse from further attendance. She was not sorry to bid him fare-

well, for a friend who has fallen below his profession is a contemptible creature, even to himself. As he turned from her the Hall bell began to ring, and she could not help feeling that it was a forlorn bell, tolling for one who had lost a great opportunity.

A few minutes after D'Acre's desertion Nathaniel saw her. She was dressed with extreme plainness in a black gown, though a kerchief of white lawn covered her throat and bosom, and a hood of white saracenit lay across her bright hair. Its silken sheen and the clear purity of the lawn made around her head reflections of white light, quite distinct in the dusty atmosphere of the room, and in them her fair face looked as a white rose looks in the garden's golden sunshine.

Nathaniel went to her side and spoke to her in whispers, he scarce knew what words, only that they came straight from his heart, and were altogether made of love and pity. Men and women whom they heeded not looked at them with interest and sympathy. For if Nathaniel had stood up in the midst of them and said aloud, "I love this girl with all my soul," he could not have taken them into his confidence more completely. And it was pleasant to see the little groups affecting a kind disregard — turning from their points of observation, or finding in their own affairs a suddenly overwhelming interest.

In the few moments' grace thus afforded many things were hurriedly said. They talked as souls may talk who meet after cycles of separation, hastening their confidences because their parting may come before their sweetest thoughts are told. Holding her hand, watching with brimming eyes the tears upon her cheeks, feeling as if life held only that precious ten minutes, Nathaniel talked with Olivia.

Then there was the sound of laughter and of footsteps on the stone stairway, and the rush of that invisible force which always accompanies the entry of a number of human beings into a room. Parson Derby and Stephen de Burg came first. Anastasia was just behind them, Squire Chenage and Sir Edward le Tall walking at her side. Judah Parke and Elijah Waring, magistrates, followed. It was said that Elijah Waring favored the Quakers, and that his wife Jenifer had joined the Society. But Judah Parke was a Presbyterian of the strictest sort, and a Quaker was an abomination to him.

A sudden silence, slightly broken by whispers and shuffling feet, followed. Then the jailer entered with Roger Prideaux, who walked between two constables. He had to pass within a few feet of Olivia, and as he did so she obeyed the impulse of her heart and rose and kissed him — kissed his face, and then

casting her eyes upon his still manacled hands, she stooped and kissed them also. The act was involuntary, it was finished before a word of dissent could be spoken, but as she sat down again an indescribable murmur of sympathy ran through the room.

It angered the parson, and he asked peremptorily that the examination of Roger Prideaux be immediately begun. The first witness called was Anastasia de Burg. She rose with that flurry which seemed inseparable from all her moods, in spite of the pride bred in her by her order and position. She readily took the proffered oath, though with some incoherence, for she was confused with the consciousness that Nathaniel's eyes were upon her.

Never had she been more bewitchingly beautiful. Never had she dressed herself with a more enhancing splendor. She wore a petticoat of lead-colored satin, with an overgown of lavender moire, trimmed with silver buttons and silver lace. A whisk of fine white point was her neck-dress, and above her flowing curls drooped a low beaver hat, heavy with white and lavender feathers. Long lavender gloves, embroidered with silver, covered her hands and arms; she carried a little Indian cane painted and gilt; and at her waist was a silver chain, holding half a dozen Italian cameo seals — the extravagant fad of the day.

Being interrogated as to her knowledge of Roger Prideaux's guest, she said:

"'T was on the 29th of May I was out driving, as is my custom, and passing Sandys Hall I bethought me of the many strange rumors I had heard of the new owners, and I determined to gratify my curiosity regarding all these. 'T was said also that Mistress Prideaux was a wonder of womanhood — of a very sober humor, infinitely discreet and virtuous, and I had a mind to see such a miracle of my sex. I found the door guarded — as treasures are said to be — by an old dragon, who refused me entrance with many excuses, all of which I denied with a determination that won my way; and so I came to the parlor, where I found Mistress Prideaux, and Captain Kelder, and a strange gentleman of a very brave countenance, whom Mistress Prideaux told me was Harald Sandys; 'fearing nothing,' as she said, 'from a person of my opinions.'"

"What said you?"

"I said the king's — I said Charles Stuart's friends were my friends; and so on with discourse of that kind, until I spoke of a ship lying off Barrow, said to be there for his Majes — for certain of the friends of Charles Stuart. And with that he immediately disappeared, and I saw him no more."

"What said Captain Kelder?"

"He spoke only of things in general; such

speech as gallants make to young women, and young women forget."

"What said Mistress Prideaux to this sudden departure?"

"Mistress Prideaux had just left the room for a cordial, and I, finding Captain Kelder's company not to my liking, took a hasty leave upon some excuse, and so to Madam Cecil's at Milnthorpe, where I related what had passed, and spent the night."

"Why did you not tell the proper officers at once?"

"In faith! I am not paid to protect the Commonwealth. I leave that to wiser heads. If 't was Harald Sandys, I wished him safe away — and no harm, I trust, in a woman's good wish. But all are not equally discreet. Some of Madam Cecil's maids heard of the affair, and so it passed around until my father demanded of me the right of the report. Further, the question is his, not mine."

"You are certain this stranger was Harald Sandys?"

"I have never seen Harald Sandys. I took him on the word of Mistress Prideaux — who is vouched for as beyond a lie."

"Would you know the man again?"

"On my word and honor, anywhere."

Olivia Prideaux was the next witness. Anastasia retired, and she stepped into her place. The contrast between the two women was sharp, that between their manners still more remarkable. Anastasia had been restless and self-conscious. Her fingers had toyed with her seals all the time. While speaking she had pushed a froward curl behind her ear, and shaken a fine handkerchief with strawberry buttons upon it, and opened her vinaigrette, and broken to pieces one of the red roses at her bosom.

Olivia was quite still. She was asked to take the oath. Her answer was low but distinct.

"I dare not."

"The law bids you do it," said Parson Derby.

"Christ forbids me. 'Swear not at all' — thou canst read for thyself."

"'T is an excuse," said Judah Parke. "These Quaker women love nothing better than the cry of martyrdom, and we may plainly perceive that this girl will rather go to prison than tell the truth against her father. My advice is that we take her on her word."

There was some discussion on this proposal, and meanwhile Olivia stood at perfect rest. Her hands, folded on the railing before her, made no movement; her interior sight, being towards Him who is invisible, gave to its mortal symbols a holy fixedness of purpose. Her face was as calm as the face of a happy sleeper. Her body, though she was standing,

was full of repose. For the consciousness of God's presence was so real to her that she quieted herself in it, as a babe is quieted who feels the throb of its mother's breast and the clasp of its mother's arms.

"Mistress Prideaux," said Elijah Waring, "we will take your word, as an oath is a point of conscience with you."

"A foolish concession, Master Waring, and I will still say so. For if this scruple stand, it will be a cloak long enough to cover all the Jesuits that may come into England." And the priest frowned angrily.

"Still, Parson, we shall not reach the witness without it. For myself I will take Olivia Prideaux's word if she tell us plainly when and where she first saw this Harald Sandys."

"On the 20th day of Fifth Month; in the garden at Sandys."

"What said he?"

"That he was Harald Sandys, and that he had been upon the king's business to Penrith, and was like to fall into the hands of his enemies, and so lose his life."

"You think him to be the man he said?"

"At the first, truly so. He told us of his wound at Marston Moor, and of his escape to Charles Stuart, and I believed him."

"Do you favor Charles Stuart as ruler of this realm?"

"I favor him not."

"Does your father favor him so?"

"My father is a lover of the Commonwealth, and of the Protector."

"Why, then, did you succor an emissary of Charles Stuart?"

"I succored him not as Charles Stuart's friend."

"How, then?"

"As a perishing man. When he fell at my feet and said, 'Save my life,' I felt favored to do so. What wouldst thou have done?"

Waring looked troubled, but he answered brusquely: "I hope I should have done right. Did you hear him speak of the Quakers, and of Charles Stuart's pity for their sufferings?"

"He spoke not of Charles Stuart, nor yet of the people thou callest Quakers."

"Your father knew that he was Harald Sandys?"

"He believed him to be Harald Sandys."

"He knew him to be on some business for Charles Stuart?"

"Yes."

"Why, then, did he succor him if he is a lover of the Commonwealth?"

"Because he was miserable and in danger. Said God ever to a miserable man, 'Whose son art thou?' Or to a perishing man, 'Servest thou the king, or the Commonwealth?'"

There was a low murmur of assent through

the room, and Elijah Waring looked at his associate with anxious eyes. He saw him not, for he was steadily regarding the young girl who had asked such a searching question.

The priest broke the silence that followed. "You Quaker women are better at demanding than at answering; and, by my word, for one so wise you took the man on light evidence. He might have been a murderer, a pirate, or a thief, for aught you know. Show us by what signs you were satisfied that he was in reality Harald Sandys."

"I have been given to understand that he was *not* Harald Sandys."

"Oh!"

An "oh" that sprang involuntarily from many a lip and in all variety of tones. Parson Derby looked exceedingly gratified, and his "oh" was one of proud satisfaction, for he perceived that his penetration had touched an important point of evidence.

"When were you given to understand this?"

"After he had gone, suddenly, without any words of thanks or kindness."

"Who gave you to understand it?"

"Nathaniel Kelder."

There was a general ejaculation of surprise, and every eye that could command him was fixed upon Nathaniel. He bore the inquisition with an unmoved countenance, though his gaze was full of fire and the lines around his mouth were stern and steady. Anastasia looked at him for a moment — a rapid glance that was first entreasy, but was instantly turned to defiance by the calm severity of his face. Then she let her gaze drop upon her seals, and lifting one she began in a low voice to talk to Sir Edward le Tall about it.

"'T was brought out of the Indies, I do believe: an idol's head very like, and sure they took the devil himself for the pattern of it; but I am extremely fond of the oddity of the ugly thing." And all through this fantastic whispering she heard the question she was dreading to hear.

"If he was not Harald Sandys, who then was he? Were you given to understand so much?"

"He was John de Burg."

A low, sharp cry, like that of an animal caught in a trap, followed. It came from the lips of Anastasia, but it was not noticed in the more furious outburst of her father.

"You lie, woman!" he shouted passionately; and then turning to Nathaniel: "And you, sir, are a damnable liar! Digest the word at your leisure."

A few moments of uproar followed. Nathaniel sprang to his feet, but instantly sat down again, with his back to De Burg. The justices gave this and that order, and the constables struck the unoffending prisoner. But De Burg, having

a method in his madness, speedily allowed his anger to give place to the law's demand, and at the request of the magistrates permitted the inquiry to proceed without further disturbance.

Olivia's cheeks had become whiter, her eyes darker, her bearing more dignified, but otherwise she had let the drift of passion pass her by as if she heard it not. When the examination was resumed she was in a mood of perfect composure.

"Do you believe it was John de Burg?"

"I do."

"Why do you believe it?"

"On the word of Nathaniel Kelder."

Olivia was then permitted to sit down. She had to face Anastasia as she walked to her place, and Anastasia did her best to make the few yards a fiery passage. But her spite and contempt and anger were utterly flung away. Olivia walked in her own atmosphere, and nothing evil entered it. She saw not her enemy, she heard not her scornful laugh, she felt not the hating glance of her evil eyes. For she was within the shadow of His wings, and he kept her in perfect peace.

Nathaniel Kelder was the next witness. His words were clear and strong and to the point. He spoke without fear, and without evident anger, yet his heart was hot within him.

"I went to Sandys on the 29th of last May. A man was sitting in the parlor with Mistress Prideaux, reading aloud 'The Elixir' of Mr. George Herbert. I was told that it was Harald Sandys; but I knew that it was John de Burg."

"Oh!" cried Stephen de Burg, "this is the perfectest lie! John de Burg reading the saintly George Herbert! As well tell us the devil was reading the Gospels."

"It was John de Burg," reiterated Nathaniel.

"How were you certified that it was John de Burg?"

"Nine days before I was told that John de Burg had been hid in his father's house for six weeks; and I was asked to shelter him and aid him further. I refused to do so. Evidence indisputable to my mind made me understand that Harald Sandys and John de Burg were the same man. As John de Burg I ordered him to leave Sandys on the instant, and to avoid arrest by me he leaped from a window and went at my word."

"'T is more and more beyond belief!" shouted the irate De Burg. "John is a world-wide villain, but yet too much De Burg to go on your order."

"I have nothing further to say."

"Asa Bevin!"

The old man rose at once and advanced with the air of one who not only has some-

thing to say but who is determined to say it. His small, prim figure, his thin, resolute face, his tall, stiff hat planted firmly on his head, were provocative of opposition.

Judah Parke felt the spirit of persecution stirring in his heart. It seemed to him like an agreeable sense of duty, and he bent forward and said sharply :

"Asa Bevin, remove your hat."

"Best Wisdom inclines me not to do so. When I pray to God I uncover my head, and I will not give to thee and sundry the honor I give to God."

"Jailer, take off his hat."¹

The hat was instantly thrown to the floor. It fell at the feet of one who kicked it out of his way, and so touching another was kicked farther, and thus until it was beyond sight and reach. Asa looked after it with a queer wrinkling of his thin face. It made mirth also for the crowd, to whom a stray hat is ever a thing for kicks and jokes, and some quip of vulgar wit just hitting the time put even the magistrates in a guffaw of laughter.

Asa looked and listened with contemptuous anger, and when Judah Parke, recovering first, asked, "What say you to this merry uncovering of a Quaker?" Asa answered: "The fool's heart is full of laughter. But whenever did the saints of God live in laughing and mocking?"

"Give him the oath."

"Thou knowest I will take no oath. I will speak the truth without the great presumption of summoning the Almighty God to be witness for me. Neither at thy command will I break the command of One who is thy Lord and Master as well as mine."

"If you take not the oath then we must send you to jail; and as for the command of Christ, ask the parson, and he will tell you that it referred to profane speech, not to oaths for the sake of truth and justice."

It was Waring who spoke, for he pitied the man who was willfully electing himself to the martyrdom of the jails of those days. Asa looked at the parson, but without any design of asking information from him, for he immediately denied the reconciling statement.

"Thou art all wrong. Profane speech had been unlawful since the days of Moses. But not for any magistrate will I break either the law of Moses or the law of Christ. Thou canst send me to jail for my refusal, if thou wiltest to do so."

"I understand not the law of Moses and the law of Christ specially so," said Parson Derby, with an air of authority.

"Thou needest God to make thee understand God."

"I preach a true doctrine. 'T would be well if you would come and hear it."

"Many preachers hear not themselves. And as for instruction, God speaks to man without ringing of church bells."

"This fellow will dispute all day long. Take his word on the matter in question; the refusal to take oath is but a door to get out of testimony against his master."

"Asa Bevin, what know you of the man called Harald Sandys?"

"Olivia Prideaux brought him to me on the 29th day of Fifth Month—a dirty, wicked-looking vagabond as ever I saw; and 't is not railing, but straight truth to say so. 'T was a face with the mintage of Satan on it, and many things were made manifest to me concerning the man and his wicked deeds."

"By what name was he known?"

"Roger and Olivia Prideaux believed him to be Harald Sandys, until he was past putting to the question. I ever doubted it."

"Why?"

"Because the Sandys face is one that hath the thought of God and the fear of God behind it. This man had the countenance of one who is wicked both of nature and of will."

"What said Roger Prideaux to you of him?"

"He said that he was Harald Sandys. He told me the man had been to Penrith on the business of Charles Stuart, and had been closely pursued, and that for the sake of human kindness he would shelter him until the ship he waited for arrived."

"What thought you?"

"I thought that the Sandys were well all dead if this man stood in their likeness. But he was none of their kind."

"How did you discover that?"

"First, by my own wisdom taught of Best Wisdom. Second, 't was Anastasia de Burg discovered me so much of her affairs. She came to Sandys on the 29th of Fifth Month, and at her first calling staid not long. Yet she went away in a great passion with Nathaniel Kelder. 'T was my place to be on the watch, and I heard her threaten him with her own wrath and also with the wrath of the man he ordered from the house, and I heard her call that man John de Burg, and with his name make good her threat."

Then Stephen de Burg rose in a fury of passion. "Will your Worship," he cried, looking to Judah Parke, "restrain the lying speech of this

¹ At this date men wore their hats constantly both in the house and in church. They sat at meals in them. They listened to a play in them. The preacher went to the pulpit in his hat, the congregation doffed theirs

only at the name of God. Hat lifting was a foreign fashion but recently brought to England. Sober men wore their hats. Wits and fops carried theirs in their hands most of the time.

pestilent rogue? John de Burg in a Quaker's house? Yes, when the devil drinks holy water. And I count it but scant kindness in my neighbors to suffer this reproach in my presence. For as the devil hates the Cross, so I hate John de Burg and all his deeds. And I will take oath that I have not seen his face these twenty years, nor wish to see it again all the days of my life. And I will take oath that it is an incredible thing he should be under my roof, even for one night. Call the witness of my eight servants and of my many guests."

"I perceive not," said Elijah Waring, "what it would advantage Roger Prideaux to put John de Burg in the place of Harald Sandys. The latter, though an offender against the law, is at least an offender with clean hands, having the plea of honorable conviction in his breaking of the law. John de Burg, with red hands, has broken not only the law of God, but the law of every nation on the face of the earth."

"On my soul! the advantage is plain enough. Harald Sandys, being cousin to the late lord, is heir-at-law of the estate bought by the Quaker Prideaux. John de Burg is outlawed of all estate. And 't is within my knowledge that Prideaux was borrowing money to give Harald Sandys. Who so blind as not to perceive that when the heir had been disposed of for a time the old rogue would sell Sandys and realize again the guineas he had spent upon its purchase? Oh! 't was a very Quaker-like plot, and I make no doubt your Worships see it."

"Think you 't was for money Harald Sandys visited Prideaux?"

"Never trust me if I see not the truth clear behind all pretenses. Charles Stuart wanting an emissary to the Quakers, mutinous under their deserved punishments, naturally sends Sandys, who knows well this corner of Westmoreland, the nesting-place of this devil's doctrine; and Sandys naturally applies himself to the Quaker, so conveniently placed both for his own rights and for those of the king—that *was*. And further, Edward D'Acre can testify that the guest of Roger Prideaux was truly Sandys. Also offer Prideaux and his man Asa Bevin the oath of allegiance, and see if they will take it; I vow they will not."

"There is no need of any further evidence," said Parson Derby. "The case against Prideaux is fully proved."

"It is most certain," added Parke. "Nevertheless he shall have every show of justice. He shall speak for himself. Let Roger Prideaux be sworn to his own words."

"I have not been given anything to say in this matter. My daughter has witnessed for me. She spoke the truth."

"Then," said Parke, "Roger Prideaux must be sent to Appleby jail for trial at the next

general assize; and if Asa Bevin take not the oath of allegiance, he must also go upon that failure."

"I am an honest lover of the Commonwealth," answered Asa, "but I will not swear to it at thy command; for the words of Christ, as I have told thee already, are positive regarding oath-taking. 'Swear not at all,' and I will not make light of them to give thy words honor. Not I, indeed!"

"Then you send yourself to prison."

"Nay, but thou sendest me; because I will not sell my conscience for a mess of pottage."

Then the clerk began to write out the necessary papers of commitment, and the petty court rose; the magistrates and citizens forming into little groups eagerly full of the same subject—the plotting of the Quakers against the Commonwealth, and their obstinacy in their own opinions.

De Burg and his party drew together with a sense of triumph. Parson Derby wished only that "there were jails enough in England to send every Quaker to the devil through them," and a Calvinist preacher standing by certified the wish with a quotation from the devout and learned Richard Baxter, dooming all Quakers "without reserve to certain perdition." De Burg himself was sullenly angry. He hated his name and affairs in the mouth of "the villain crowd," and his heart was burning with wrath against Anastasia and the Kelders. He stood by the side of Sir Edward le Tall, saying nothing to him, but assuring his savagely offended inner man of reprisals hardly to be accomplished without some devilish help.

Le Tall, De Burg, and Parson Derby quickly left the room; Anastasia lingered a little behind. She had received one look from her father promissory of what was yet to come, and it roused in her a desire to pay some one in advance. Drawing up her gloves and setting all her bravery in order, she strolled past Asa Bevin. He was standing in charge of a constable waiting the written order for his commitment, and she regarded him with eyes of malicious triumph.

"Have I done what I promised to do?" she asked.

"The devil through thee hath done what he was permitted to do. His servants never want work, but he pays ill wages, Anastasia de Burg. Seek thee a better master."

In a moment Chenage struck him, and the old man fell to the floor. Olivia, whose face was on her father's breast, saw nothing of the circumstance, but as Anastasia turned she met the full gaze of Nathaniel Kelder. What shame for her there was in it! His eyes burned her somewhere beyond mortal touch. She dropped her own to escape the piercing glance that made

her blush and quiver with an intolerable chagrin; and though she held her head high, her laugh was uneasy, and her spirit cowered before him and was glad to escape his presence.

The upper part of the room was then almost empty, but there was a crush of delaying gossips around the entrance. Suddenly a man taller than any around him appeared, and they instantly parted right and left and made a path for him. He had a fair, large, radiant face, and a carriage full of authority. He went straight to Prideaux and laid his hand upon his shoulder.

"Friend Roger, I have just heard of thy trouble. How is it with thee in the storm?"

"It rages all around me, but not above me."

"The soul has two houses, Roger: one in the meadows, that is Love; one in the mountains, that is Faith. Flee now to the mountains; from thence cometh thy help. Olivia, my dear daughter, Jenifer Waring waits for thee. Shall I take thee to her?"

"I will take her," said Nathaniel.

"Thou art a good, brave man. I thought that of thee at the first. Wait for me outside. I have a special word for thee."

Then Olivia knew that the moment of parting had come. But she filled its little space with a whisper of vastest comfort. And so they said farewell like those who trust in God; the ring of faith in their voices, the smile of hope on their lips.

Many looked at the lovers as they walked through the room and down the steps together, Nathaniel very erect, yet holding Olivia's hand with a tender pride that silenced every unkind word. At the door they found Jenifer Waring waiting in her coach for Olivia, and she received her with a sober kindness that the most timid must have trusted.

"Olivia Prideaux will find shelter in my house so long as she wishes," she said to Nathaniel; and then she gathered her in her arms, and gave the word which separated the sorrowful lovers.

In the mean time Roger was rapidly giving Fox the points upon which his accusation hung, and Fox was listening with the air of a man who already knew them.

"These things I will care for, Roger," he answered. "In the will of God thou must go now as he makes way. It seems then that thou art wanted at Appleby jail. See thou kindest a fire there and leave it burning. And verily I know that God keeps for his people in prison consolations such as he gives nowhere else. On the bare ground I have had sweet sleep, and in the midnight God's comforting presence has awakened me, and continued with me unto the morning watch. Thy enemies are his enemies. Verily, he will arise and scatter them. And of thy bitterest cup thou shalt say joyfully, 'My God is the portion of it.'"

"George, thy words are strong to lean upon. Say a few to Asa Bevin."

Asa was just rising from the floor, and still dazed and trembling with the shock of the blow.

"George, is it *thee*? I have been struck."

"Well, then, Asa, thy Lord Christ was also struck and buffeted. He knows all about the pain and the shame. Fear not."

"I fear nothing that man can do unto me. Not I!"

"There is a hard road before thee."

"I see his footsteps on it."

"And a steep road, shelving down even to the depths of the grave."

"I lean upon the Cross. A good staff! It will never fail me."

"Farewell, Asa! I have been given to see that we shall meet no more in this world."

"Well, then, George, it is a good farewell"; and stepping forward, and lifting up his hands, palms outward, he said, "Bear witness, that for all the mercies I have received I praise and magnify my God!"

The old man was at this moment beautiful. The shining of the Light within transfigured him; and, like Stephen of old, his face was like "the face of an angel." The spirit mastered the flesh, and George Fox saw not the outer but the inner man.

So Roger Prideaux and Asa Bevin went that day to Appleby jail, but the Lord went with them.

(To be continued.)

THE POEMS OF EMMA LAZARUS.

*. . . echoes that belong
To one in love with solitude and song.*

ECHOES thou didst thy noble verses name,
The legacy thou leav'st to time and fame.
Not so: O sated, modern mind, rejoice!
Here sound no echoes, but a living voice.

Margaret Crosby.

LARAMIE JACK.

I.

N A certain splendid afternoon, when not a single cloud showed itself in the expanse of blue sky, a train was passing, at the moderate pace befitting the severe grades, over the little narrow-gauge road, and literally climbing into the recesses of the Sierra Madre. It had glided merrily over the plains at the base of the mountains, threaded its way among the foothills, traversed some deep cañons, and clung to narrow shelves cut on the side of the rocky barrier. Then it had descended into a great "park," crossed it, and begun a new ascent. Some of the passengers in the "chair-car," to whom the journey was no novelty, were reading or dozing; others, taking it for the first time, gazed delightedly at the ever-changing scenes before their eyes. Then the sun sank behind the great range, the darkness came on apace, and pretty Lucy Avery turned from the window and looked at her father, who sat on the opposite side of the car in conversation with a fellow-traveler. This individual had fiery red hair and a cropped mustache; his costume consisted of a gray flannel shirt, somewhat the worse for wear, and trousers of dubious hue; and he was innocent of any ambition in the direction of white linen. Mr. Avery was a man of good sense and intelligence, whose vacations were few, and he had started on his Western trip with the avowed intention of making the most of his time in the study of the new phases of human nature which he was likely to encounter. As his eyes met his daughter's, he leaned towards her with a smile.

"My dear," said he, "I want to present a fellow-passenger, the mayor of Carbonate City—the place where our day's journey will end, and which I learn from him to be an important town, growing and pushing; 'booming,' to use the phrase of the country. He has given me much needed information."

The good mayor was a person of distinction in the city—late mining camp—where he lived, and it was with an honest pride as such, as also in accordance with his well-known admiration for the fair sex, that he had asked for the introduction which he now sought to acknowledge in a fitting manner. It is not strange, however, that when he saw Lucy looking straight into his face, with her big blue eyes, and the smile on her lips emphasizing the

dimples,—and her father had left him in the lurch, and gone to draw out another type of character in the shape of a lately successful miner,—his courage failed him for a moment. The young girl, in her perfectly fitting, tailor-made traveling costume, with hat trimmed to match, her dainty gloves, and her little high-heeled boots, was a novel representative indeed of the class to which he affected an honest superiority—the denizens of the effete East; "tenderfeet," so to speak. For this moment, indeed, he even felt that he would gladly have exchanged his present position for the presidency of the city council on the celebrated occasion when the fight was most bitter over the location of the new irrigation ditch.

Very soon, however, the young girl—who was quite accustomed to, and doubtless enjoyed, such silence and embarrassed homage to her charms—put him at his ease with a few pleasant words. She had questions to ask which he was able to answer, and he was soon talking freely.

"Yes, Miss," said he, "your father let on that you and he had come all the way from the States to see your brother and his ranch. I allow I 've met him, for I know most of the young fellers down on the North Fork, but I disremember him just now."

"In his letters he has several times mentioned a friend called 'Jack,' a well-known frontiersman," said the girl. "I think they are much together."

"I allow that 's Laramie Jack!" eagerly cried the man. "Now I remember about your brother. I have heard Laramie speak of him. Why, Miss, he 's a friend worth havin', and don't you forget it. There ain't a whiter man than Laramie Jack from the Wind River Mountains down to Santa Fe. I would n't wonder if he 'd come on this train at the next station. I heard some of the boys say he was due at Carbonate City to-night."

"Indeed!" said the young girl, with interest.

"Yes, Miss; he's been down to help a pard of his'n, a feller they call 'Comanche Charley.' You see Laramie he 's a chap that 's got a great big heart, and all the boys are fond of him, for there 's nothin' he won't do for a friend. Well, Comanche he had real hard luck. He had a ranch down on the San Rosario Flat, and bless me if the grasshoppers did n't eat up all his crops, and the Indians kill his wife and child when he was away; and you see this made him kind of loony-like for a while,

and Laramie he just put out and found him, and took care of him and stood by him until he come round and was more like himself again; and now he 's going to take him into the mountains for a huntin'-trip, to cheer him up, as you might say. I tell you what, Miss, when we get to Dead Man's Gulch—that 's the next station, you know, and I 've got to get out there—I 'll see if Laramie 's comin' in; and if he is, I 'll have time to introduce him to you. He 'll tell you all about your brother, dead sure."

"Lucy, my dear," interrupted her father, who had in the mean time found still a new type of character, "I wish to present to you a young Englishman, Mr. Belford Mordaunt, who is living on a ranch in this neighborhood and remembers meeting your brother Frank. Excuse me, Mr. Mayor, but may I trespass a little further on your valuable time before you reach your station? Thank you. Now, where do I understand you to say that my son is likely to be?"

"Well," said the mayor, "I just told the young lady that the man who 'd be sure to know all about him—being, you see, a real good friend of his'n—might come on the train at the next station, and that if he did I 'd introduce him to her. His name 's Laramie Jack."

"Laramie Jack'?" repeated Mr. Avery. "Peculiar name; very characteristic of the frontier, I should say. A friend of my son's, too, eh? What sort of a man is he, Mr. Mayor?"

"Well, sir," said the mayor, "he 's as white a man as you ever see in all your life, as I was tellin' your daughter, and there ain't a better fellow in the mountains. And then"—in his enthusiasm he dropped more into dialect—"he's tough too, you can bet your sweet life. Did n't you ever hear of what he did down in New Mexico last year? No, of course you did n't. How could you, when you was n't here? You see, he struck a feller that 'd had bad luck and was nigh on dead broke, and he done the square thing by him, and they come to be pards. This other feller was real quiet and good appearin', and the boys all liked him. Well, one night he was havin' a little game in the back room of a store up to Taos; and Balty Sykes—they called him Balty because he come from Baltimore; and some folks called him the 'Taos Terror' too, for he was on the shoot every time: Balty he come in. He let on that he wanted to join the game, and Laramie's pard he said no, they did n't want him. So Balty he did n't say one word, but he went in the feller's room and set down there in a rockin' chair that he 'd brought out from the States, and when the poor feller come

in, Balty he drawed and shot him dead. Then he put out, down Santa Fe way. Well, some one heard the shot, an' he roused the camp, an' a party got their horses an' started after Balty. When they 'd been gone some time, Laramie he rode into the camp an' wanted to know what was up, an' they told him. He heard them all through, an' then he turned round—real quiet like—to a Greaser an' sung out to him to fetch a fresh horse; an' he rode off, never sayin' another word, except to ask which way the cuss had gone. It wa' n't long before he met the party comin' back, an' they told him they had n't no show to catch Balty, because he 'd got so much the start; an' Laramie he said that was all right, but he just allowed he 'd keep on an' try, an' he did. You see he went slowly over the high *mesas* an' ridges, but he just rode like—over the low lands and in the valleys; an' after a while he comes up behind Balty, real quiet an' pleasant like.

"How are you, Laramie?" says Balty.

"How are you, Balty?" says Laramie.

"I 'm sort of 'fraid," says Balty, "that I 've struck a streak of bad luck. I fired at a man down to Taos, an' I allow I hit him."

"What's that?" says Laramie. "Ain't we had a man for breakfast often enough in Taos?"

"You see he was just speakin' that way to put Balty off his guard, an' he rode right up alongside of him, just the same as if they were pards, an' all the time he was lookin' him over, an' he saw two ivory-handled six-shooters in his belt. Well, they rode along, an' Laramie he was talkin' real pleasant, an' all of a sudden, quick as a flash, he draws his gun an' puts it to Balty's head, an' says he, 'Drop your belt, or I 'll kill you!'

"You don't mean it," says Balty, startin'.

"Drop your belt, an' be—quick about it, or I 'll kill you," yells Laramie; an' Balty he did n't wait no longer.

"Have you a derringer hid about ye?" asks Laramie.

"No," says Balty.

"Well, Laramie he feels him over, an' says he, 'Turn round an' ride back to Taos, or I 'll shoot you, the way you shot my pard.'

"An' Balty he knowed the game was up, an' he did n't say another word, but just rode along as quiet as a lamb; an' as they passed the belt, with the two pistols in it, lyin' on the ground, Laramie he swings himself down an' picks them up; an' all the way back to Taos he never took his eyes off of Balty, an' kept his gun pointed at him. An' when he got back to the town, an' Balty was locked up, you bet the boys just rode Laramie round on their shoulders, an' they set up the drinks—champagne wine too, eight dollars a bottle!

"Yer see, Laramie he did n't let on how he got away with Balty, but Balty himself told the boys, when they was tryin' him. He said no one else could have done it."

"A very remarkable tale," said Mr. Avery. "Quite interesting, upon my word. I should like to see this extraordinary person."

"Well, you won't have long to wait for that," said the mayor, who had opened the window and looked out as the train slackened its pace, "for there he is on the platform, an' I'll go out an' speak to him."

A few moments later he brought him in; a tall, powerful man, with dark hair and beard, deep-set eyes, and quiet and gentle of speech and in manner, but conveying the impression of great reserved force. Behind him, at some distance, came a thin, pale companion, with downcast eyes, and a noticeable expression of pain and weariness on his face. Both were dressed in the costume of the country—flannel shirts, with handkerchiefs loosely knotted round their necks, thick trousers and boots, and large sombreros.

"Mr. Avery," said the mayor, "I want to make you acquainted with my friend Laramie Jack. I have n't got more than a minute to do that in, because, you see, the conductor's behind time, an' he can't stop. But I allow you will soon be friends, for he knows your boy down on the North Fork. Well, good-by, Mr. Avery; an' you too, Miss, an' hopin' I'll see you at Carbonate City." He shook hands hastily with the party and left the train.

"I won't introduce my pard to you, Mr. Avery," said Jack, in his low, deep voice, "because you see he's all broke up with his hard luck."

"Yes, yes, I know," said Mr. Avery; "I heard of that. Very distressing, indeed, upon my word. Let me present you to my daughter."

This presentation was made, and the conversation for some time was general; but before the train reached Carbonate City, Mr. Avery was talking with the young Englishman, and Miss Lucy, with her eyes fixed on Laramie Jack's face, was eagerly questioning him. Any one who knew him well would have seen that, despite the apparently imperturbable coolness of his manner, he was deeply interested; and well indeed might he have been so when thus brought, for the first time in his life, into friendly intercourse with a girl so richly endowed in heart and person. As a bustle among the passengers made it evident that the train was nearing its final stopping-place, he spoke, with just an additional shade of animation in his voice.

"I'll tell you what it is, Miss," said he; "you an' your father had n't ought to stay in such an unrighteous place as Carbonate City one

minute longer than you need. Now, what you want to do is to get a bit of supper while I have a team hitched up, an' then we'll take you right out to Old Man Wilson's ranch, where the North Fork comes into the river. It is only twenty miles, an' a splendid moonlight night, an' when you get there you'll have good beds an' good grub. An' then, to-morrow morning, my pard here an' I, we'll light out an' find your brother, who, I allow, has been up for two weeks to a ranch farther on an' has n't got your letters, an' I'll fetch him to you."

When this project was communicated to Mr. Avery, to whom the severest drawback in his journey had been the poor accommodations, he agreed to it at once. While he and his daughter were eating their supper, and after Comanche Charley had mounted his bronco and ridden out in the direction of a pass in the mountains, Laramie Jack had two fine "States" horses harnessed to a buckboard. In due time they started, and Lucy said to herself that she would never forget that twenty-mile drive through the great cañon in the Sierra Madre, with the moon lighting up one of its wooded sides, and this remarkable frontiersman conducting them on their journey.

As for him, when the young girl and her father were safely ensconced in comfortable rooms at Old Man Wilson's ranch, he stood outside in the bright moonlight, and his eyes turned more than once towards the building, and at last, as he walked away, he cast one glance behind him and said:

"I told her I would fetch him, an' I will."

II.

THE room was shabby and ill kept, and the bar ran across one end of it. Leaning against this bar, or sitting on benches ranged along the wall, were rude, rough, savage-looking men. Some were dull and heavy, others quarrelsome, all hopelessly bad and degraded, and most showing

Concave faces, trampled in,
As if with the iron hoof of sin.

Behind the bar a seedy ruffian, with an expression half languor and weariness and half contempt for his customers, served them slowly and carelessly. The door opened, and a young fellow entered; of handsome face and good figure, but showing the effects of dissipation, and intoxicated. A year or two before there had been no likelier or more promising young ranchman in the mountains than he; no better rider, no one more active in the "round-up." When he wrote home about the grand, free, health-giving ranch life, however, he did not

"PUT UP YOUR GUN!"

give the other side of the picture; did not tell of the long hours of loneliness, the gradual lowering of outward habits and mental tone, the low company and squalid accommodations, the bad food, all combining to drive him to that ever-ready but treacherous resource, whisky. A fine fellow, indeed, had Frank Avery been; but he was now in a bad way, and, unless a friendly hand were held out to him, likely to follow, and quickly, the downward path.

He walked with unsteady step to the bar and was about to call for a dram, when one of the loungers jostled him and uttered some insulting epithet, comprehensible even to his dulled faculties and impelling him to active resentment.

"Oh! that's your little game, is it, young feller?" cried the man. "Waal, you take notice that I've got the drop on yer, an' I'm bound to hev a man for dinner to-day."

Suddenly the outer door opened and closed, and there was a heavy step on the floor. Another moment and Laramie Jack came quickly behind the speaker and gave him a fling which sent him reeling against the bar, only to find himself, when he regained his feet, facing the muzzle of a cocked six-shooter.

"Put up your gun!" said the new-comer,

in a firm voice. "We've had enough of your talk. Bound to have a man for dinner, eh? Well, you'll have him somewhere else than here. Now, you get out of this mighty quick, an' don't let me see your face again, if you know what's good for you."

The man slunk out of the room.

"Well," continued Jack, "have you dead-beats anything to say to me? No? All right." He put his hand on the young fellow's shoulder. "Come along with me," said he, and drew him away.

Later in the day, these two men sat facing each other on benches outside the door of a log cabin. At some distance was poor Comanche Charley, perfectly still, his head buried in his hands. The young man, evidently in distress of mind, listened without demur to the words of his stalwart companion.

"Now, Frank," the latter was saying, in his deep tones, "I ain't no saint, as you know mighty well, an' I ain't setting myself up to preach, or to be down on other folks when I've got plenty to answer for myself; but I swear to you that when I see what rum's doing out in these mountains, which, by good rights, is God's country, and would be but for the cusses that spoil it with their doings—I say when I see what rum's doing here, blame

me if I don't have a mind to join the Salvation Army. You know I've tried to do the square thing by you and keep you from the company of that devil's crew down on the Fork, but when I got on the train"—his voice took on its softest tone and his eyes grew tender—"an' saw that sweet little sister of yours, an' she looking at me with those big eyes, that might be an angel's, an' asking me about you, why, blame me if I did n't feel mighty bad, an' as if I had n't looked out for you worth a cent. Why, my boy, if I had a sister like that to care for me, an' she thinking I was all right, an' doing my duty like a man, an' living a good life, I'd blow my brains out before she should be mistaken in me. Say, Frank, it ain't too late. She don't know nothing an' don't suspect nothing. You must brace up right now an' never again—" He stopped and listened, with his hand to his ear, and Comanche Charley stood up straight and did the same. There was a sound of galloping hoofs. It came nearer, and in a moment a man rode around the corner of the house—a cowboy, pale as death, the veins standing out on his forehead, and his left arm hanging helpless by his side. The horse, panting and covered with foam, stopped short, and Comanche Charley sprang to catch the rider as he reeled in his seat.

"What is it, Johnny?" he asked.

The poor fellow gasped out: "Indians broke loose—big crowd—coming down on Wilson's ranch—I saw them—tried to get away and give the alarm—they shot me—" His head dropped on his breast and he fainted dead away.

Laramie Jack stood with teeth clenched, while Comanche Charley seemed transformed; his eyes burned like coals, and he strove in vain to speak. Jack put his hand on his shoulder.

"There 's just one thing to do, old pard," said he. "Rouse the boys an' get out the horses, an' let some one take care of this poor chap. Then you collect as big a party as you can, all of the right sort. I'll put out for the fort an' get the soldiers; an' you meet us where we strike the trail from there to the ranch. There 's not a minute to be lost. You know who 's down at Wilson's—you saw her."

Comanche Charley was drawing long, deep breaths; he said not a word, but made for the stable. Jack turned towards Frank with a look of hesitation. The young fellow ran to him and took both hands in his.

"Jack," said he, "take me with you. Great heavens! I *must* go. I know of what you are thinking; but, so help me God, I am a changed

man from this moment, and, if we get through this, I will be one all the rest of my life. Jack, old man, let me go."

Jack looked at him for a moment in silence. "Well," said he at last, "I allow it 's sent to you to go, an' I can't say no. We'll hurry with the horses." His face changed again, and he seemed almost frenzied.

"Get a couple of Winchesters an' six-shooters, in the house," said he, "an' I'll help do the saddling." In a few moments' time they were off, just as Comanche Charley struck his spurs into his horse's flanks and galloped in the other direction.

The animals were splendid, and one would have said that they knew how much depended upon them, for it was indeed to be a wild gallop.

Not a word passed between the two for a while. Laramie Jack led slightly, riding straight towards a tall branchless tree on the crest of the rise up which they were racing. In the clear and rarefied air this crest seemed very near, but in reality it was far away, and the horses had begun to breathe hard when they reached it; then they saw the descent on the other side, and, standing out against the side of a hill at the extremity of the plain lying beyond this rise, the white buildings of the fort. The horses had need to be surefooted not to bring their riders and themselves to grief as they sped down the rough trail; but it was not long before they reached the plain, and as they traversed it at a furious pace Jack turned to Frank and looked at an English hunting-crop which he had mechanically picked up when leaving the ranch.

"Lend me that," said he, and in an instant he had bound his white handkerchief to the end of it and was signaling the fort. Soon there was a response from the white flag held high in air.

"Lucky I learned that signal racket," said Jack, as, still at a furious pace, he made cuts in different directions with his extemporized flag.

"That will save us nearly fifteen minutes," added he.

"Frank," he said, "God knows if I have done right in bringing you; an' if I have n't, I could n't ever look that little girl in the face." As he said the last words he almost groaned, as if in agony.

"I swear it shall be as I said," cried Frank.

On, still on, they rushed; nearer and nearer came the whitewashed buildings, with the starry flag flying over them. Suddenly they heard the report of a howitzer. Jack knew what that meant—the signal to the men herding the troop horses on the plain outside to stampede them to the fort; the intelligent

animals being trained always to run in that direction. Soon, speeding on, they saw the horses come bounding in over the buffalo-grass. Then signs of great activity were visible in the fort. Again, but a few moments, and they sprang from the panting steeds in front of the adjutant's office, on the piazza of which stood the major of the —th Cavalry, a handsome man with iron-gray hair and a scar on his cheek. His adjutant was by his side, ready for duty. All was bustle and stir — the sergeants directing the men who were busying themselves with their horses; the quarter-

"All right," replied the major in an instant. "Tell me the rest as we go along."

He turned to the adjutant, who gave the word to the trumpeter, and no music was ever sweeter than the clear notes, ringing out over the plains, of "Boots and saddles!"

Now ensued a scene of haste and seeming confusion, but with a wonderful method in it all. The saddles were on almost in the twinkling of an eye; then they could hear the men numbering off: "One, two, three, four — One, two, three, four," like the beats of a pendulum, and the battalion was in line. Some one found

"INDIANS."

master and the commissary, with their assistants, making ready the rations for transportation; the spare ammunition going on the pack-mules. All this, the moment the young man's foot touched the ground, he saw as in a dream, so keen was the excitement under which he was laboring. Thus far it had seemed as if they had lost no time; now he was seized with a frenzied haste to be off again. The commanding officer advanced with a bow.

"We made out your signals, gentlemen," said he, "and, as you see, we have not been idle. Now, where is the place?"

Laramie Jack explained hurriedly, but with great clearness, and all the time the seconds seemed minutes and the minutes hours.

Jack and Frank fresh horses, and shifted saddles. Then rang out in quick succession the orders: "Prepare to mount" (every other man led his horse to the front) — "Mount — Right forward — Right by twos — March — Trot!" and in column, the major and the adjutant with Jack and Frank in front, the company officers in their places, and with jingling of spurs and rattling of accouterments, the force debouched upon the plain.

Frank did not keep his place by Jack's side, but left him to guide the column, and fell back to a humbler position. As he did so, one of the lieutenants of the second company nodded pleasantly to him, just as he would have done had they met on Broadway; and he remem-

bered that when the young man graduated at West Point he himself had been present. A fresh, red-cheeked lad was the officer in those pleasant bygone days; now his complexion was bronzed, his figure had filled out, and he looked every inch the soldier, albeit he was dressed in a flannel shirt, and trousers distinguishable from those of the men only by the extra breadth of the stripe, and wore a large felt hat. They rode together for some time, and Frank endeavored to gain some information from him as to their probable course of action.

"I had just a word with Jack before we started," said the lieutenant. "I made his acquaintance last year up at Fort Fetterman. He told me that the ranch lies on the farther side of an isolated hill and close under it. I suppose he has suggested to the major to make the approach screened by this hill, and thus unseen, and then divide and charge on Mr. Lo. Jack understands these things well, and if he would regularly turn scout he would have plenty of employment from the army. What surprises me is the excitement he has shown about this matter. It is very unlike him, and yet he can hardly have any personal interest in it."

They were making steady progress, but the intense desire to push on faster, faster, had again taken possession of Frank. When they had ridden about half an hour, he could not help asking his friend if they were not soon going to quicken their pace.

"Never fear," said he, with a smile. "Do you see that hill ahead?"

Sure enough, it stood out clearly, as if only a few hundred yards away; yet he had not even noticed it.

"When the major thinks he is near enough," the young officer added, "be assured that he will make the pace quite as fast as you will want it."

Jack had been riding close to the commanding officer, in eager colloquy with him, accented by gesticulations. Just at this moment he drew away. The major turned, the order was given, and in a second all were in a furious gallop. Never was Frank's blood so stirred before, or his nerves at so high a tension, but he seemed to be conscious of the very slightest details of the situation. There, straight ahead, stood the square hill, lifting itself in the sunlight, and towards it, at a mad pace, but in the strictest order and perfectly aligned, went the powerful column. With every bound of the splendid horse under him his excitement increased. All he had known, read, or heard of such scenes crowded into his brain, and to the rhythmical beat of the hoofs fragments of wild cavalry songs perfectly fitted themselves. As the pace

grew even faster he found himself repeating, half aloud:

A steed, a steed of matchless speed,
A sword of metal keen;
All else to noble hearts is dross,
All else on earth is mean.
And oh! the thundering press of knights,
Which, as the war-cries swell,
Might toll from heaven an angel bright,
Or drag a fiend from hell!

A "thundering press of knights" it was indeed, although they wore no helmets and no coats of mail, and boasted not of noble rank or high descent; for not Godfrey of Bouillon himself, or Prince Rupert, ever rode straighter, or with stouter heart and more knightly purpose, than Companies C and K, —th U. S. Cavalry.

Suddenly Laramie Jack fell back to Frank's side. He was perfectly quiet, but he spoke with an air of repressed excitement, and his eyes fairly blazed. He touched Frank's arm and pointed away to the left, where they saw, in a cloud of dust, another party of horsemen bent in the same direction as themselves.

"There they are," said he, "the boys Comanche Charley has collected. Nothing the matter with him or with them, you bet. There is n't a man on the plains that knows Indians better than Comanche; and then his heart's broke along of 'em, and he's wild to have his revenge. Every one of the boys he has with him is a fighter, too, from a hundred miles back of 'way back. I know them, Frank; and now, — me, if we don't give those hell-hounds the biggest thrashing they've had in ten years."

Soon they were halted, and Comanche Charley's party was with them — the leader never taking his hungry eyes off the horizon ahead. This halt was made at the north side of the hill or detached mesa, which, it seemed, sheltered the ranch from the winds; and here a consultation was held. Then the order was given to form line, and soon the two companies were ranged side by side, with the officers in front; again a moment, and they were on the march, each taking one side of the hill, and Comanche Charley's party making a long détour, with the intention of coming in well to the rear of the Indians, who were understood to be mainly on the south side of the ranch. Frank went with the second company, and they had hardly gone a hundred yards before they heard firing. The captain took no notice of this, but kept his soldiers at the steady pace at which they had started out. As they proceeded this firing increased, and it was incessant when the captain beckoned to Jack, with whom, after he had halted the men, he rode cautiously ahead. Soon they returned, and Jack, coming to Frank, drew him to the flank of the company.

"Now you 'll see some fun," said he; and then, all of a sudden, his face flushed, and he seemed to fly into a sort of frenzy. He rode quickly behind the soldiers, saying, in low, concentrated tones: "Give 'em —, boys! Remember our pards that they 've killed, and the women and little children. Give 'em —, I say!" Then, growing calmer, he turned once more to Frank.

"My boy," said he earnestly, "you are going under fire. Are you all right?"

"All right," replied the young man.

"Well," said Jack, with a sigh, "shake hands, and God bless you!"

At a trot the company moved on. They cleared the hill, and there was the ranch, surrounded on three sides by a very large body of Indians. Its defenders were evidently hard pressed, but they were making a vigorous resistance, as could be seen by the flashes of the rifles fired from within the building. Frank had hardly time to glance at the scene, and just heard his friend the lieutenant say, as he looked at him with a smile, "Big thing," when the captain, drawing his revolver, turned in his saddle and in ringing tones gave the order to charge. In a second all the pent-up excitement of the men burst forth, and with the wild yell which invariably accompanies this movement they hurled themselves upon the foe.

Then ensued a scene confused beyond description, a turmoil of shots, cries, groans, and shrieks; a pandemonium never to be forgotten. Frank found himself in the thickest of it, and, striving to do his part, saw fierce hand-to-hand encounters; saw savage painted faces distorted with rage or pain; saw friend and foe go down together. Then through the smoky cloud he saw the charge of the other company; then the onset of Comanche Charley's men, with blazing revolvers and deep curses, their leader, like an avenging demon, apparently bearing a charmed life and taking deliberate aim before each deadly shot. All the time, too, he saw that Laramie Jack, fighting like a paladin, managed to keep near and watch over him even when, at last, the blood mounted to his brain and he caught the spirit of the fiercest, and, with a berserker rage, charged into the midst of the group of savages making the last stand. For, although it was a terrible contest

of the soldiers and volunteers against that body of foemen, the finest braves of the tribe,—and, thanks to the accursed Indian policy of this country, furnished by the agents and traders of the Great Father with better arms than those of the troops,—it came to an end, and there was mourning in many a wigwam for that day's work. This last stand was made by a body of young warriors, at bay and asking and giving no quarter; and the major himself led the charge on them. It was successfully achieved; the road to the house was open, and Frank made a rush for it. Although, as he passed, he had seen Jack turn deadly pale, he knew not that he was wounded; he saw Comanche Charley at his friend's side, and the thought of meeting his sister had taken possession of him. In another moment she was clinging to him, while his father held one hand and "Old Man Wilson" the other, the latter saying excitedly:

"Pluckiest little gal I ever see. Why, blame me if she did n't load for us — *load* for us, do you hear?"

"Lucy," said Frank, "come and see the man to whom you owe your rescue."

She went with him. Laramie Jack lay on the ground, Comanche Charley supporting his head, and the military surgeon kneeling by him. The soldiers stood around, sad and silent, and the major passed his hand over his eyes as he turned away. They reached the spot just as Comanche Charley caught the look in the doctor's eyes, and with a heart-broken cry bent over his friend.

"No, no, it can't be! Not for him to be took and me to stay! Speak to me, old pard; for God's sake speak to me," he cried, as the tears rolled down his bronzed cheek.

Laramie Jack opened his eyes, but even the frenzied appeal of his grief-stricken friend failed to call his soul back from the borders of the silent land. When, however, Lucy dropped, sobbing, on her knees by him, something almost like a smile came to his face, and his lips moved to whisper:

"I — told you, Miss,— I 'd fetch him,— and — I 've done it."

And then, gently, as if, instead of a rough frontiersman, he had been a sad-eyed saint or a Christian martyr, Laramie Jack went out of life.

A. A. Hayes.

LUCINA.

THINE are the buds within the woody spray
That reddens toward the spring and lengthening day;
Thine subtly, from the patient toiling root,
To draw sweet currents to the topmost shoot.—
Smite thou with solar shaft,
Rock on Æolian draft,
Buffet with down-poured floods,—
Feed strong thy tenderlings, the unblown buds!

Thine are the germs that when the year died down
Hid them below the year's despoiled crown;
Thine to release to them the vital store
That garnered lies at the white frostless core.—
Dislodge the cumbering mold,
Shower them with Titan's gold
In sylvan glades, in meads;
They are thy little wards, the striving seeds.

And thine the yet unplumed, unsinging hope
Of singing ones that by a sun-warm slope,
Or hollow where the brake is first unfurled,
Hover, and brood the center of a world.—
Be their mute hope thy care,
Soon on the dew-fresh air
Faint hunger-cries be heard,—
Thou quickener of the nighted, shell-bound bird!

Thine, thine all life until the birth-hour fall,
And nascent being waken at thy call:
Then fleest thou, inconstant, having won
For each the world-embathing air and sun.
Not stayed by gift or vow,—
A soft half-memory thou,
A waning aureole
From the bright mist that wrapped the stranger soul!

Thou—is it thou that to the early year
Lendest a glory fugitive and dear,
A passion to its chill, dim-colored flowers,
A restless vigil to its murmuring hours?
O chary ministrant
Of dreams revisitant
When vernal winds arise
Breathing vague cheer from other earth and skies!

As the pent leaf and song-bird wait for thee
To dart the orient beam that sets them free,
We wait some tremulous forerunning glow,
Signal of life supreamer than we know.—
In shining morn and spring,
To fields Elysian bring
And crown with being's whole,—
Thou daybreak of the worn night-traveling soul!

Edith M. Thomas.

THE NATURE AND METHOD OF REVELATION.

III.—THE DIFFERENTIATING OF CHRISTIANITY FROM JUDAISM.

OW the ties which at the outset held Christianity and Christian believers within the pale of the Jewish religion, with no thought of breaking away from its appointed ordinances and rites, came to

be completely dissolved, forms a highly interesting chapter in early Christian history. The leading agent, the man specially chosen of Providence to introduce this new stage of development, was a converted Pharisee, Saul of Tarsus. A remarkable characteristic of the revolution — or evolution, if one prefers so to call it — is the circumstance that there neither lurked in it nor ensued from it any antipathy to the Old Testament religion. It involved no discarding of the ancient Scriptures in which the revelation to the Jews was recorded. Moses and the prophets continued to be revered as divinely commissioned teachers. The Old Testament continued to be the Bible of the Christian churches. Up to the time of the composition and collection of the Apostolic writings they had no other Bible. It was read in their Sunday assemblies. The God whom Christians worshiped was the God of the patriarchs, the same who “spake . . . unto the fathers by the prophets.” The religion of the Gospel assumed no antagonistic relation to the religion of the Old Testament. Yet it came to pass that the Old Testament ritual was dropped. The title of the Jews to peculiar and exclusive privileges in the community of Christian believers was set aside. The demand that the Christian believer should come into the Church through the door of Judaism, by conforming to the rites ordained for heathen proselytes, was no longer made. Christianity was, and was perceived to be, one thing, and Judaism another; and soon there was a wide gulf between them. At the beginning we find the Disciples “continuing steadfastly with one accord in the temple,” although they met, also, by themselves for social worship (Acts ii. 46, Revised Version). If they were, in a sense, to borrow a phrase now current, “church-goers,” they were likewise “temple-goers.” They were like other Jews; only they believed that the Messiah had come, and, although he had been rejected and crucified, they looked

for his second appearing in power and splendor. The daily devotions, the solemn festivals, the smoking altars of the Jewish system, were as dear and sacred to them as they had ever been. The converts were to be baptized, but baptism did not supersede the necessity of circumcision for admission into the Judaic-Christian fraternity. But pass over a few decades of years and we discover that this conformity to the old system has vanished. Numerous Christian churches are planted in which the Mosaic ceremonies are not practiced. In process of time the revolution is complete. The synagogue is no more a place of resort for Christians. Their fellowship, such as it was, with disbelieving Jews, who formed the bulk of the Jewish people, is broken off. The rupture is absolute. The opposition is mutual. The Jews pursue the Christians with bitter maledictions. The Christians are of one mind in discerning that the old ritual with its burdensome yoke of ordinances is obsolete. They no longer tolerate the observances which at first they expected all of their number to practice.

This revolution was the consequence of no injunction of Jesus. He himself kept the law in its ceremonial as well as in its moral parts, notwithstanding that he protested against the over-rigid interpretations of the Pharisaic school. He distinguished between the laws themselves and the “traditions of the elders” — the glosses and additions which the doctors had affixed to the Old Testament legislation under the pretext of expounding it, or of applying it to unforeseen cases. He denounced the pernicious casuistry which brought in now an evasion of moral duties, and now an imposition of ceremonial performances which the spirit of the law did not exact. He taught that the value of institutions consisted in their usefulness. They were not an end in themselves, but a means for attaining a good beyond them. Rules were not framed for their own sake. Even the Sabbath was made for man, and not man for the Sabbath. While Jesus encouraged no revolt against the ritual system, while he even enjoined conformity to it according to its proper meaning, and himself set an example of such conformity, the spirit of his teaching and the work done by him undermined it. They could not fail to lead to the discontinuance of the Jewish cultus. Eventually it would

be seen to have no longer a *raison d'être*. It would come to be felt to be as needless a burden as winter garments in the mild air of summer. The time must arrive when the Jewish system would be consciously outgrown. To keep it up would then be like the attempt of an adult to wear the clothes of a child. Jesus did not decree the subversion of the Jewish cultus, that ancient fabric which had sheltered religious faith in the days of its immaturity, when the community of God was waiting for a full disclosure of his purpose of mercy and of deliverance for the race. He did not by one sudden stroke demolish that system, but he put gunpowder under it. And yet this is not an apposite simile. We should rather say that he prepared the way for the gradual, intelligent abandonment of it. There might be temporary confusion and even occasional contests; but on the whole the change was to be in a true sense natural, like the melting of the winter snows and the coming out of the leaves and blossoms under the increasing warmth of the vernal sun. Jesus taught that religion is spiritual. He showed, as the prophets before him had proclaimed, how empty is a round of observances into which the heart does not enter, and which are not accompanied by righteousness of conduct. "Mercy is better than sacrifice." He said of one that he was not far from the kingdom of God because he discerned that the love of God and man "is more than all whole burnt-offerings and sacrifices." The illustrations in the Sermon on the Mount of that fulfillment of the law which he came to secure all relate to moral tempers and moral conduct. He taught the infinite worth of the soul, the impartial benevolence of God, and that love is the substance of the law. His teaching was void of sympathy with Judaic exclusiveness. That the institutions of the Gospel could not be identical with those of the old system, he taught when, in answer to the question why his disciples did not fast, he said that "new wine must not be put into old bottles." He said that not what goeth into the mouth defileth a man. This he declared, the Evangelist adds, "making all meats clean." He laid down the principle that defilement is from the heart alone, from bad feelings and motives—a principle which cut the ground from under the ritual as far as it related to meats and drinks. Jesus implied that he was conscious of an authority higher than that which prescribed the laws of the Old Testament, when he superseded the Mosaic precept concerning divorce (Matt. xix. 8, Mark x. 5); when he declared the Son of man to be "the Lord of the Sabbath" (Mark ii. 28, Luke vi. 5); when he affirmed that he and his disciples were not under an obli-

gation to pay the tax to the temple (Matt. xvii. 24–27). "In this place," he said, "is one greater than the temple." The priests, it had been understood, were absolved from the strict observance of the sabbatical law. They might on any day offer their sacrifices; they might "profane the Sabbath" without guilt. The thought was not so remote that he who was greater than the temple might supersede the temple. To the woman of Samaria he said that worship was confined to no local sanctuary (John iv. 23, 24). There were predictions of a downfall of the temple, of the letting out of the vineyard to other husbandmen (Matt. xxiv. 2, Mark xiii. 2, Luke xxi. 6, John ii. 19, Matt. xxi. 41, Mark xii. 9). Then he made everything turn on the relation of men to himself. The test of character was belief or disbelief in him. The one condition and source of communion with God was personal communion with him whom God had sent. When this last truth should be fully apprehended, what space would be left for any other priesthood or sacrifice? At the Last Supper he so connected his death with the forgiveness of sins as virtually to dispense with the need of any other offering or intercession than his own. In fine, the large and spiritual view of the nature of religion which Christ presented, together with the sufficiency which he ascribed to his own work as a reconciler, made the cultus of the Hebrews, including the national rite of circumcision, superfluous. But how should the free and catholic spirit of the Gospel come to be recognized? How should the fetters of custom, and ingrained reverence, and national self-esteem—the claim on the part of the Jews to precedence and to some kind of perpetual sway in the concerns of religion—be broken? For so great a change time was required. In matters where feeling is strongly enlisted, where lifelong prejudices are to be overcome, where usages are closely linked, from long association, with devotional sentiment, there is often between the premises and the legitimate conclusion a long road to travel.

The purport of the Gospel in the particulars to which I have referred was discerned by the Apostle Paul at an early date, and it was more clearly and vividly perceived by him than by any other. Whether Paul had in his hands written accounts of the teaching of Jesus we are not informed. For what he says of the institution of the Lord's Supper (1 Cor. xi. 23 *seq.*) he had in some way the direct authority of the Lord. He refers it to a direct revelation; for so we must interpret his language. On the contrary, what he says of the appearances of Jesus to the other Apostles after his resurrection (1 Cor. xv. 1 *seq.*) he had ascertained from

them. We cannot be mistaken in supposing that Paul was acquainted with teachings of Christ which, in his judgment, contained an implicit warrant for that broad interpretation of the Gospel and of the privilege of the Gentiles under it which he adopted; such teaching of Jesus as we have cited above from the Evangelists. In his intercourse with the other Apostles—it is important to remember that Paul spent a fortnight with Peter—he had the best opportunity to rectify any mistake, if he had fallen into any mistake, in respect to this part of the Saviour's teaching.

It has been sometimes said that Paul himself professes not to be acquainted with the facts of the ministry of Jesus. This strange statement is founded on a misunderstanding of his meaning when he says that he did not receive the Gospel from men, but "through revelation of Jesus Christ" (Gal. i. 12). This direct relation to Christ, who revealed himself to him and called him to be an Apostle, does not preclude the obtaining of knowledge through secondary sources. That he did not care to learn what Christ had taught and done during his earthly life is something quite incredible in a man of his active intelligence and Christian feeling.

That Paul became the leader in the work of emancipating the Church from Judaism has been sometimes attributed to the liberalizing influence of culture and learning. He was that one of the Apostles, we are reminded, whose mind had been expanded by study, and whose intellect had been invigorated and widened by a scholastic training. But on this subject of the education of the Apostle to the Gentiles there are prevalent mistakes which require to be corrected. One of them is the ascription to him of a familiarity with Greek classical writers. This idea is based partly on certain utterances of his which correspond to sayings of Greek authors. There are three of these passages. The first is in the Apostle's speech at Athens: "As certain even of your own poets have said, For we are also his offspring" (Acts xvii. 28). The quotation is found in Aratus, a poet who belonged to Soli, a place near Tarsus, and it occurs, also, in that noblest example of devotional poetry that has come down to us from a heathen source, the Hymn of Cleanthes. Both Aratus and Cleanthes belonged to the Stoic sect. The second passage of this kind is an Iambic verse: "Evil company doth corrupt good manners" (1 Cor. xv. 33). This has been referred to Euripides by many, including John Milton, who remarks that "Paul thought it no defilement to insert into holy Scripture the sentences of three Greek poets, and one of them a tragedian." But the passage is traced by scholars at present to the

"Thais" of Menander. The third of the passages traceable to heathen sources is the unflattering description given of the Cretans (Titus i. 12): "Cretans are always liars, evil beasts, idle gluttons." The words form a hexameter and are from Epimenides, a Cretan poet, whom Plato styled a "divine man," and whom Paul does not scruple to call a "prophet"—recognizing in him, as regards this particular saying at least, a remarkable divination or foresight. But probably all these passages were proverbial sayings, and as such were caught up by the Apostle from the conversation of the day. According to the correct reading of the passage from Menander, Paul deviates from the metrical form; which indicates that, unless he did not know what the original was, he preferred to give it in the shape in which it passed current as a proverb. There is really nothing either in the style of Paul's writings, or in their contents, to show that he was versed in the Greek classical authors. As to his style, it is unlettered Greek. It is not likely that a man of his high intellectual qualities could have read an author like Plato without distinct traces of the fact being evident both in his language and in his thoughts. On a mind of an inferior order a feeble impression might have been left by the masters of Greek philosophy, poetry, and eloquence, but not on a mind like that of Paul, in case he had been conversant with them. He was born, to be sure, in a city where Greek was familiarly spoken—although the inscriptions discovered recently in that region do not indicate that the Greek in use there was of a choice character. Tarsus was a seat of Stoic philosophy. It must be remembered, however, that Paul was the son of a Pharisee, that he was a Hebrew of the Hebrews, and was no doubt brought up after the strict method of Pharisaic training. Such a father as he had would not have put pagan authors into his boy's hands. He had for his teacher at Jerusalem the rabbi Gamaliel. The advice which, according to Luke, was given by this noted rabbi to his fellow-members of the Sanhedrim reveals a certain moderation and sagacity. He dissuaded them from using force against the Apostles, for the reason that, if their cause was right it could not be put down, and the attempt to put it down would be impious; while, if their cause was wrong, it would come to nothing all the sooner for being let alone. His appeal to the instances of Theudas and Judas of Galilee, fanatics who raised a disturbance which lasted but a little while, would seem to indicate that he anticipated a like failure for the new enterprise which the Apostles were trying to promote. Whether Gamaliel was simply politic, or had some genuine tolerance in his temper,

may be a question. This we know very well, that his ardent pupil did not share in any sentiment of this kind. He was an approving spectator of the killing of Stephen. He plunged into the work of a heresy-hunter and inquisitor. He seized on the disciples of Jesus and shut them up in prison. He tried in the synagogues to force them to recant. He chased them from one place to another; for he was "exceedingly mad against them" (Acts xxvi. 11). It is certain, therefore, that Paul had not imbibed any lenient sentiment towards dissentients from the standards of orthodoxy; and it would be irrational to credit him with feelings of this kind towards the heathen. His education was rabbinical; and traces of its peculiar character crop out occasionally in his way of arguing and of illustrating truth, even after he had been lifted into the higher atmosphere of the apostolic calling.

Nevertheless, there exist in the writings of Paul striking coincidences with Stoic philosophic teaching. The correspondences between New Testament passages and Stoic maxims and precepts is a fact that calls for explanation. It is more marked in relation to Seneca, the Roman Stoic, the preceptor of Nero, than in regard to any other of the philosophers of the Porch. The similarity in his case extends to numerous sayings of Jesus as well as to other portions of the New Testament. The theory was broached by several of the ancient fathers that Seneca was a Christian convert. There appeared a forged correspondence between him and the Apostle Paul. From the time of Jerome, it was taken for granted that Seneca had been won over by the Apostle to the Christian faith. There is nothing to disprove the supposition that Seneca may have gathered up, perhaps from slaves of his household, fragments of the teaching of Christ and of Paul. Yet it has been observed that some of the most striking parallels are with the Epistle to the Hebrews, and this Epistle was written after Seneca's death. The whole basis of Seneca's philosophical view is utterly at variance with the Christian system. This circumstance is fatal to the hypothesis that he was connected with Paul, as the legend represented.

But how shall we account for the Stoic phraseology which is undeniably found in Paul's speeches and writings? The Stoic ideal of the sage painted him as lacking nothing, as the possessor of all things, as alone free, as alone happy, as alone rich, as the true wise man, the true priest, the true king. In similar terms the Apostle delineates the Christian believer. We seem to be hearing echoes of Stoic sayings. The Stoic system was cosmopolitan in its character. The kinship of mankind, that the Stoic is a citizen of the

world, a denizen of all lands, are frequent affirmations of Seneca, of Epictetus, and of the imperial philosopher, Marcus Aurelius. This universality of fellowship the Apostle affirms of the Christian believer. In it the boundaries of race and nationality are effaced. Such ideas in Paul are presented in an original, entirely different setting. There is a groundwork for them in Christ and his kingdom, which was wanting to the Stoic, with whom these lofty distinctions could have but little more than a negative import and value. However, the verbal resemblance remains. This is best accounted for by the intercourse into which the Apostle was brought with Stoics, both at Tarsus, where he dwelt for a considerable time after his conversion, and in other cities which he visited. At Athens, as we are told, he disputed with Stoics and Epicureans. These were the popular philosophical sects at that time. With the Epicurean tenets he could find few points of contact. But in the ethical ideas and maxims of the Stoics, although they rested on no basis of fundamental truth that was satisfactory, and although the Stoic ideal, for this reason, could not be realized, the Apostle discerned features which he, from his higher point of view, could appropriate. He could take them up and infuse into them both a significance and a worth which they had not before possessed. The relation of Paul to certain Stoic terms and phrases was somewhat like that of the Apostle John to the term *Logos*, or Word, and possibly to some other phrases in his writings. Terms in current use in the discussions of the day John could take up and transfigure, as it were, so that they became a fit vehicle for expressing the higher truth which was derived, not from any philosophical source, but from revelation and from the direct impression made by Jesus upon the susceptible spirit of his disciple.

The reason, certainly the main reason, for the exceptional liberality of Paul, or his complete emancipation from Judaic prejudice, is not to be found either in his learning, or in his marked perspicacity. His mind was no doubt disciplined and made capable, above most others, of looking into a question to its very core. He had no need of an acquaintance with Aristotle in order to grasp a doctrine in its logical relations, and to carry it out to the legitimate inferences. And he had a superiority in knowledge — not merely in that sort of knowledge which an eager scholar of the rabbis would of course acquire. He had a store of knowledge, constantly increasing, drawn from observation and from contact with adherents of differing schools of opinion in the places where he sojourned. But the secret of his catholicity, as we have

seen, is not to be found either in his talents or in his culture. To discover that secret we must turn to the history of his conversion. Great as the transformation was at that crisis, yet in important respects he was the same man after as before. If we look at him first on the day when he was on the road to Damascus, armed with credentials from the high priest, and then look at him again when he was on one of his great missionary journeys, we behold the same energy, the same aggressive, conquering force. He was a crusader from first to last. No revolution of motive and of moral temper could be greater. He had become humane, loving, willing to give up his life, and even his own salvation, for the sake of the Jewish countrymen who detested him as an apostate. And the end in view—how different! Then he was bent on exterminating the class whom now he regards with an almost motherly tenderness. Then it was to extirpate a faith which now he cherishes, and for which he is ready to be offered up! Nevertheless, the natural qualities of the man, the qualities that made him a leader and, when consecrated to the service of the Gospel, a Christian hero, were his in the first as well as the last of the eras into which his life was divided, and between which seemingly a great gulf was fixed. There is one other element of resemblance, or thread of continuity, of more consequence still. His ideal from the beginning to the end of his career was righteousness. To stand right before God, acquitted, with no accusation lying against him at the bar of the Judge and in the forum of conscience, was always to his mind the one inestimable good. He attached the same value to it after his conversion as before, the same before as after. As to what is involved in being righteous, and how righteousness can be attained, these were points on which there was a world-wide difference between the earlier and the later conception. But the aim in its generic character was unaltered.

In the attempt to explain the conversion of Paul in such a way as to eliminate the miraculous elements in the event, a naturalistic solution has been suggested. The persecutor, it is said, was probably haunted with misgivings in reference to the course that he was pursuing. He had heard of the moral excellence of Jesus; perhaps he had seen him. He had been touched by the forgiving, heavenly spirit of the dying Stephen. The meek demeanor of the harassed disciples was not without its influence. In short, there was a conflict arising in his mind; there was inward anxiety, amounting to self-reproach. Here, it is urged, was a state of feeling which might give rise to hallucination—to the imaginary vision of Jesus. The

trouble with this theory is that not only is there no evidence that Paul felt any such disquiet respecting the rectitude of the errand on which he was bent, but there is decisive evidence that he did not. The phrase "It is hard for thee to kick against the pricks" means nothing more nor less than that he was engaged in a futile enterprise. It has no reference to any feeling of compunction. He was like an animal kicking against the goad. That is to say, his undertaking against the Christian faith was a hopeless one. But he says: "I verily thought with myself, that I ought to do many things contrary to the name of Jesus of Nazareth" (Acts xxvi. 9); "I obtained mercy, because I did it ignorantly in unbelief" (1 Tim. i. 13). There was no insincerity, no inward halting, no doubt as to whether Jesus might not after all be the Messiah. There was no psychological state of the kind which would pave the way for an illusive vision of Jesus. In epistles the genuineness of which is beyond dispute, the Apostle attributes his conversion exclusively to the grace of God and an act of revelation (Gal. i. 12, 16). "While," writes Weiss, "he constantly accuses himself of persecuting the Church, as being the greatest sin of his life, he never intimates that he struggled long against better knowledge and conscience, in opposition to the testimony of the truth." He never ascribes the revolution in his convictions, which was accomplished at a single stroke, to proofs appealing to his understanding, but always to facts accepted in faith, "on the believing acceptance of which his peace of soul and his eternal salvation depend." Hence if it was a vision that produced the change, it was a real vision, and no product of illusion. It was a vision that convinced him not only that Christ continued to live, but that he had risen in bodily form; so that, if this was an error, "it was God himself, by causing this vision, who led him into the error." This perception of Christ, while he was on the way to Damascus, stands apart from other visions, of which he did not care to speak. On it he rested as the guaranty of his apostolic office (1 Cor. ix. 1). There was included in it not only his commission to be an Apostle, but more specifically, to be an Apostle to the heathen.

The sight of Jesus in the glorified state swept away the "stumbling-block" which was contained in the idea of a crucified Messiah, and served to demonstrate the fact of his resurrection. But into the conversion of Paul there entered something more than the giving up of disbelief in the divine mission of Jesus. That, in itself considered, might not have carried with it any great spiritual change. In the seventh chapter of the Epistle to the Romans the veil is drawn aside, and we have

glimpses of the course of his inner life. Without doubt he speaks of his own personal experience, although he speaks as in this matter consciously the representative of human nature. He shows how the attempt to get inward peace by the method of law had collapsed. The seeking for righteousness on this path had brought him to utter despair, to a sense of helplessness. At the outset, as we may suppose,—in his younger days,—he was “alive.” His natural feelings and desires were in full activity, with no painful consciousness of wrong. But “the law came.” There came a time when the holy ideal of duty to God and man rose before him in the rigor of its perfection. Then he “died.” His peace of mind was gone. The conflict between the desires on the one side and the restraints of law on the other produced a schism in the soul. A distressing battle raged within, in which the better nature was felt to be powerless, felt to be a slave panting for liberty, but struggling in vain to free itself. To what extent this feeling of condemnation and of bondage was experienced by him when he was on the way to Damascus—whether this consciousness of guilt and of weakness was not greatly intensified in the days that immediately followed—he does not tell us, and we have no means of knowing. But this moral conflict it was that prepared him to welcome the gospel of deliverance. There was a better way to attain to righteousness; namely, a free pardon from God, and a new life in the spirit, a heart-fellowship, a grateful feeling, a filial relation which made obedience easy. He learned by experience that a legal system had in it no life-giving power. It could only condemn. It could only make one aware of his need of help from some other quarter. When it had done this work it had fulfilled its office, and was superseded by those forces of spiritual aid and healing which are contained in the gospel of grace.

Now what must be the effect of this experience on Paul's view of the Old Testament legal system, including the ceremonial features? He could look on that system only as something preparatory and provisional. It was like the ancient pedagogue, whose business it was to lead boys to school and leave them there. Law and grace, the old dispensation and the new, appeared to him in the sharpest contrast. In his philosophy of religion, ceremonial prescriptions, as means of salvation, were “beggarly elements”; that is, rudiments which had had their day. The other Apostles, the original Disciples, had not passed through a like spiritual crisis. They had been led on, step by step, in the company of Jesus, into a full sympathy with him and trust in him as a Saviour. They knew that, believing in him, and follow-

ing him with a loyal spirit, they were forgiven and saved. In common with Paul they held with one accord that reconciliation was through Christ, and that the humility of the publican in the parable was the temper of mind alone becoming a sinful man. The gradualness of their religious progress, the absence of a momentary, decisive turning-point, prevented them from seeing at once, and from seeing so distinctly, that relation of the new to the old, of gospel to law, which Paul's experience made as clear to him as sunlight. Their minds were open; they were ready to be guided by the Spirit, and they were thus guided; but, so far as human instrumentality is concerned, it was Paul who led the way.

What effect on his mind had these new perceptions, the outcome of a living experience? They could have no other effect than to level the barriers of race and nationality. Where were now the privileges on which the Jew plumed himself? Sin was a characteristic equally of Jew and Gentile. The same divine law which through Moses and the prophets had been revealed to the Jew had been written on the heart of the Gentile. Both rested under the same condemnation. It was not on the Gentiles exclusively, it was on “the world,” that the burden of guilt rested. And what could circumcision, lustrations, the sacrifice of animals, do to deliver any from the double yoke of self-accusation and evil habit? There was only one means of deliverance, one remedy for heathen and Hebrew alike. It was the Christ and faith in him. Moreover, Paul had seen the Christ on a heavenly throne. His kingdom was evidently not a temporal one having its seat in the city of David. Even when he should come again, the kingdom was not to have this earthly character. The Apostle no more knew Christ “after the flesh,” as belonging to one nation and leading here among them a human life. He says, “Our citizenship is in heaven” (Phil. iii. 20). There Christ is, and there, for this reason, is the center of our polity. There is the seat of authority in the commonwealth in which we are citizens. When the Lord comes, the “body of our humiliation”—the mortal body, borne down by persecution, privation, suffering—is to be assimilated to his glorified body, to that heavenly mode of being that belongs to him. Paul's conception of the kingdom is changed. His idea of it is wholly different from that of those who had not shaken off the associations of a political theocracy, with Jerusalem for its capital and with the temple on Mount Zion for the place of resort for all nations. When we consider the birth, and education, and earlier characteristics of this Pharisee, this inquisitor, thirsting for the blood of heretics, how astonishing is

the declaration, "There is no distinction between Jew and Greek" (Rom. x. 12)! Few more remarkable utterances ever fell from human lips. Yet the reason which is connected with it explains all: "For the same Lord is Lord of all, and is rich unto all that call upon him." There was but one Lord, and there was not less mercy in his heart for the heathen than for the Hebrew. In a religion that is spiritual, where there is but one Lord, and salvation is a free gift from him, there "cannot be Greek and Jew, circumcision and uncircumcision, barbarian, Scythian, bondman, freeman: but Christ is all, and in all."

We pause for a moment to point out a profoundly interesting parallel between Paul's conception of the death of Christ as bringing Jew and Gentile together, and certain most instructive and pathetic words of Jesus. At the last Passover, we read in John's Gospel, certain "Greeks,"—who were not Jews, but heathen, probably proselytes of the gate,—who had come up to the festival to worship, came to Philip, one of the twelve, and expressed their wish to see Jesus (John xii. 20, *seq.*). Philip reported this to Andrew, and then both carried the request to the Master. It is one of those circumstantial accounts which in its manner, not to speak of its contents, shows the truthfulness of the Gospel narrative. When the two Disciples delivered their message, Jesus exclaimed: "The hour is come, that the Son of man should be glorified. Verily, verily, I say unto you, Except a grain of wheat fall into the earth and die, it beareth much fruit." The visit of the Greeks, heathen, proselytes of the gate, and their request, was a suggestion to Jesus that the time had come for him to die, and thus to open the door for the wide extension and growth of his kingdom beyond the limits of Judaism. That very idea of the significance of his death is intimated which is clearly brought out by the Apostle Paul.

THE first sign of a disposition to break through the wall that fenced off the Gentiles appears in the liberality of tone which was manifested by Stephen. It drew on him the charge of having threatened with destruction the whole Mosaic system of worship. His death dispersed the Church and sent abroad many to engage in missionary work. Philip, one of the deacons, preached with success in Samaria, and the Samaritan converts were recognized by the Apostles. The Samaritans, however, were among the circumcised. But the Ethiopian chamberlain, the eunuch, was only a proselyte of the gate, if he was even that. It required supernatural communications to Peter

to induce him to receive the Roman centurion Cornelius, and others with him, as disciples, and to sit at the same table with them. But Peter, when he returned to Jerusalem, was taken to task for his proceeding. When he told his tale the accusers were quieted, and there was joy over this accession of Gentile believers. The illiberal spirit was quelled, but only for a time. It was not at Jerusalem, but at Antioch that the catholic interpretation of the Gospel first gained a foothold. There some of the dispersed disciples, Hellenists, or foreign Jewish converts, preached the new faith to the heathen. There in that great city, which was one of the three principal cities of the Roman Empire, Rome and Alexandria being the other two, the message of the Gospel met with a quick response in heathen souls that found in it satisfaction for their spiritual hunger. Barnabas, himself a foreign-born Jew, a native of Cyprus, was sent by the Jerusalem church to look after this new movement.

For a number of years after Paul's conversion he is almost lost to our knowledge. There was a sojourn in Arabia; and then, after the lapse of three years, a return to Damascus. From there he was soon obliged to flee. Then followed a visit to Jerusalem to see Peter, with whom he spent fourteen days. After this visit he went into "the regions of Syria and Cilicia." The churches in Judea had not met him, but had only heard that he who had been a violent enemy of their cause had now become a preacher of the faith which he had persecuted. Later, he is found at Tarsus, and thence he is brought by Barnabas, who needed his help, to Antioch. They "taught much people" there, and there the disciples were first called "Christians." There is a coincidence between the ceasing to be a Jewish sect and the acquisition of the new name by which believers in Jesus were thenceforward to be designated. Up to this time they had been called "Nazarenes," "Galileans," or "Ebionites." Paul and Barnabas, according to Luke, were sent upon the occasion of a famine in Judea with contributions to the Jewish Christians there; but as Paul makes no allusion to his being there on this errand, it is probable that by some accident he was hindered from accomplishing it.

So vigorous was the Antioch church that it sent missionaries into Asia Minor. On the return to Antioch of Paul and Barnabas from their missionary journey, they found the church in a ferment. Men from Judea had arrived and had raised a disturbance by warning the disciples that they must conform to the Jewish law and be circumcised, or give up the hope of salvation. There was discussion and debate between Paul and his companion on one side and the Judean visitors on the other.

Finally it was resolved that the two Antioch leaders should depart at the head of a deputation to confer with the Jerusalem church on this all-important subject of dispute. In that church there had been an addition of members from the Pharisaic sect who were opposed to conceding liberty to the Gentile converts in this controverted matter. The rapid growth of the Antioch church, the multiplying of heathen converts, might naturally awaken anxiety and give rise to misgivings among many who had given way under the peculiar circumstances in the case of Cornelius. It was not now a question about a few individuals. Here was an organized church, on the basis of absolute freedom from "the law," and engaged in a successful work of propagandism. What was to become of the distinctive privilege of the Jew? Was the new kingdom to abolish the old cultus? Was it to be composed largely, and perhaps predominantly, of uncircumcised heathen? The turn of events brought up afresh a question of vital moment. Paul, on his side, had a full sense of the importance of the crisis. He resolved to meet it in the frankest and most direct manner. He would go to Jerusalem and meet the Apostles and the church there, face to face. He went up, he tells us, by "revelation"—by divine sanction; but he went, as Luke states, with the sanction of the Antioch church and as their commissioner. Fourteen years had elapsed since his visit to Peter; seventeen years had passed since his conversion.

We are brought to the memorable occurrences of which we have accounts in the fifteenth chapter of Acts and the second chapter of Galatians. At Jerusalem the demand was made of Paul that Titus, a Greek convert who accompanied him, should be circumcised. Here was a practical test that would decide the point in dispute. This demand the Apostle met with a resolute denial. That there was a pressure upon him which it was not an easy thing to withstand is evident from his language. At that supreme moment he did not flinch. The intense agitation which the recollection of the crisis stirred within him is betrayed in his language. It causes him in referring to it, as Lightfoot remarks, to make shipwreck of grammar. We can well believe that his voice trembled as he dictated the passage to his amanuensis. Did the other Apostles join in this request, so repugnant to his views and feelings? We are not justified by anything that he says in inferring that they did. Yet it would appear that Paul was left to stand alone, with no outspoken sympathy from any quarter. It is not improbable that even the Apostles, at that moment, under the circumstances, recommended him to yield, and to make the required concession. But he felt that the principle was at stake.

The very meaning of the Gospel, the breadth of its grace, the liberty of the Gentile, hung on a pivot. The Apostle took a stand like that which Luther took at Worms; but with a difference. But for Paul, there would have been no Luther; unless, indeed, it should have pleased God to raise up, in the room of Paul, another equally clear-sighted expositor of the truth and intrepid leader in the Church. There was another difference. There were numerous friends at Worms to sympathize with Luther's position. Paul was alone.

Paul and Barnabas took the precaution to have a private conference with the leading persons in the Jerusalem church before they should meet its members as a body. Paul laid before the select company the substance of his preaching, the Gospel as he understood it, in order that his career as a missionary might not be interfered with by a division among the Apostles themselves, and an opposition to him, the fruit of misconception. The other Apostles were told not only what Paul and Barnabas had preached, but also the result of their preaching—how that among the heathen Paul had been as successful as Peter had been among the Jews. No further persuasion was needful. Peter, James, and John had nothing to add to Paul's teaching by way of correction or amendment. On the contrary, they extended to the Antioch leaders the right hand of fellowship, with the understanding that their work was to be among the heathen, while their own work should continue to be among the circumcised. There was a cordial fellowship, as was implied in the engagement of Paul to collect alms from the Gentile converts for the poor disciples of the mother church. The danger of a rupture was now over. It was settled that the heathen were not to be driven to become Jews in order to be Christians. But it remained for the apostle of liberty to meet the Jerusalem church as a body. Our knowledge of this public gathering we owe to Luke. At the meeting the recruits from the Pharisaic sect renewed their demand. Peter opposed it in a characteristic address wherein he referred to what had occurred in relation to Cornelius. James spoke the final word, quoting, as he naturally would, passages from the prophets. He gave his voice in behalf of catholicity, but recommended that the heathen converts should be enjoined to abstain from certain practices which were especially obnoxious to men of Jewish birth, who had been trained to observe the laws of Moses and were to continue to do so. These articles of peace clashed with no principle which Paul valued. They included nothing that could fairly be called a modification of his teaching. They probably put in a definite form what was already a custom of the Gentile converts. They

are based on the injunctions, imposed alike on Israelites and strangers among them, which are set forth in the seventeenth and eighteenth chapters of Leviticus, and included the usages which were practiced by proselytes of the gate. The agreement of the Jerusalem conference, therefore, was not a compromise or concession to Jewish prejudices. It served to keep the peace among the disciples in Syria and Cilicia, to whom it was addressed. At a later day, when Gentile churches were independently established and in remoter places, the Apostle does not feel himself bound to refer to this pastoral letter of the Jerusalem conference. In writing to the Corinthians he considers the question of "meat offered to idols" on its own merits; just as he calls for gifts of money for the Jerusalem Christians without referring to the stipulation that he should make a collection for their benefit. Yet he teaches nothing at variance with the essential purport of the instructions given to the Gentile converts. We may be sure that James would have been content with nothing less than these "necessary things," and that Paul would not have consented to go farther in the path of concession. To the fact of their harmony and satisfaction with one another Paul himself testifies. That he did not go to the extreme attributed to him by Baur and his fellow-critics is clear enough from his express recognition of the "gospel of the circumcision" as having been committed to Peter, and of the divine blessing which had been accorded to Peter in his work (Gal. ii. 8).

Ecclesiastical settlements were not then more certain to be final than in later times. It was understood on all hands that the Gentiles were to be left unmolested. But it was expected that Jewish Christians, whoever they were, would continue to conform to the old observances. To this Paul felt no objection. What he refused to do was to impose an obligation of this sort on the heathen; he would not allow it a place among the terms of salvation. If in the consultation of the Apostles at Jerusalem his own work had been approved by Peter, he in turn had approved Peter's work as the Apostle of "the circumcision." It was enough for him that the legal observances were not made the foundation of the disciples' hope in Christ. As regards outward things, he was no revolutionist. He let the Jewish national usages remain as they were. He willingly conformed to them himself. Not needlessly to offend Jews, he caused Timothy, whose mother was a Jew, to be circumcised. But still there were points which the Jerusalem conference left undetermined. So the controversy was reopened at Antioch in relation to one of these unsettled points. The Jewish and heathen converts there mingled together freely

and sat down at a common table. Peter, as well as Paul and Barnabas, had no scruples of conscience respecting this kind of free intercourse. But at length certain persons came from James. We are sure that they were persons of influence; for when they objected to this liberality on the part of Jewish Christians, not only Barnabas, but even Peter, deferred to them, and "drew back and separated" themselves. The rest of the Jewish Christians followed them. Here there was suddenly drawn a new line of division between the two classes of Christians. Once more Paul had to stand by himself. He sharply and publicly rebuked Peter for timidity and unfaithfulness to principle. He, a Jew, had been living as a Gentile himself, and now he was trying, so far as his example went, to bring the Gentiles to live as if they were Jews. The authors of this trouble came from James. It is not safe to conclude that they came expressly on this errand. Yet it may be that the liberal course taken by Peter was the occasion of their mission. It is, on the whole, probable that their view of the subject was one in which James participated. He had given to Paul and Barnabas, in all sincerity, the right hand of fellowship. It does not follow that he expected the old restrictions as to eating with the Gentiles, and their social relations in general, to be swept away. It is likely that he did not interpret the Jerusalem arrangement in so broad a way as Paul construed it. A church made up, as at Antioch, of Gentiles and Jews together, presented a case which in the conference had not been definitely considered. The tradition about James as it was given by Hegesippus, the Jewish Christian historian, in the middle of the second century, represents him as an ascetic, observing the Nazarite rule, strict in all his ways, frequently resorting alone to the temple, "praying for the forgiveness of the people until his knees grew hard and thin." We see him, on the occasion of Paul's last visit to Jerusalem, receiving the Apostle to the Gentiles with fraternal cordiality, to be sure; yet advising him to make a further manifestation of his respect for the ritual by taking on himself a vow, which involved the shaving of the head. The motive of James's counsel is thus explained in his own language: "That . . . all may know . . . that thou thyself also walkest orderly, and keepest the law" (Acts xxi. 24). The occurrence shows how strenuous James was for the keeping up of the Mosaic ceremonies by the Jewish Christians, and how anxious he was that Paul should do something to efface a prevailing impression that he had tried to induce Jews to discard them.

The spirit of James is clearly disclosed in the Epistle which bears his name. It was in-

cluded in the ancient Syriac canon, and as it was addressed to Jewish Christians outside of Palestine, it was not improbably intended to be read primarily by Syrian disciples. The law, in the spiritual import given to it by Jesus, is prominent in the writer's esteem. We observe in the Epistle not a few echoes of the teaching of Christ. The practical tone, averse to all theory and theologic disputation, is obvious. Its doctrine is not contradictory to that of Paul, but moves in a different line. As Jesus had taught, it is said that men are to be judged by their works. There is a verbal contrast with sayings of Paul; for example, in the definite assertion that Abraham was justified by works. Whether or not we are to conclude that the author had in mind a current use and misuse of Pauline phraseology, depends on the date to which James's Epistle is to be assigned. Some would place it too early to admit of any reference to Pauline theology. There is much in the peculiarities of the Epistle—as in the application of the name "synagogue" to the meeting-place of Christians—to favor the supposition of a very early date. Could it be shown that it was written by James at a later point of time, the opinion that it refers to Pauline language would be more probable.

What was the immediate outcome of the renewed controversy at Antioch, the Apostle in his letter to the Galatians does not inform us. Taken up with his theme—salvation by faith alone—he drops the consideration of personal matters. About seven years after the Apostolic conference at Jerusalem and the subsequent rebuke of Peter, we find Paul writing an epistle to the Christians at Rome. During this interval he had been pursued with animosity by the Judaizing faction, of whose malignity he repeatedly complains. Nowhere does he imply that the other Apostles are in sympathy with these enemies of himself and of the Gospel. On the contrary, his references to the other Apostles imply the opposite. Yet the reports which the Judaizers set afloat concerning him, to which a reference has just been made, might easily excite a certain degree of alarm and uneasiness even among the Apostolic leaders who had extended to him the right hand of fellowship. We must bear in mind that the disturbance at Antioch had followed. Whether the separation of Paul from Barnabas, the immediate occasion of which had reference to Mark, had any connection with that incident, we are not informed. At all events, when Paul writes to the Romans, he is looking forward to another visit to Jerusalem, not without some anxiety about the reception that will be accorded to him. He asks for the prayers of the Roman brethren not only that he may be delivered

from the hostility of the unbelieving Jews in that city, but also that his "ministration" might be acceptable to the "saints" there. There was some apprehension in his mind lest the collection which he had been making for the poor in the Jerusalem church might be unwelcome (Rom. xv. 31), gathered as it was from churches composed of heathen converts, and while the accusation of being hostile to the observance of the Mosaic rites by anybody was circulated against him. His kind and fraternal reception by James and his associates dispelled this apprehension. The mob of Jews that assailed him, notwithstanding the precautions taken to appease their wrath, showed the hatred which had been accumulating against him in the course of the missionary campaigns in which he had spent the later eventful years.

The Apostle now passed into the custody of Roman officers. At the end of about two years he was conveyed to Rome. After the lapse of another equal interval, he appears to have been set free for a time. Once more a captive, it was in the closing part of Nero's reign, the period of the tyrant's unbridled cruelty, and in the year 66 or 67, that he fell under the sword of the executioner. If the name of James is not an interpolation in a passage of Josephus, James perished in the interval between the death of the procurator Festus and the arrival of his successor, or in the year 62. As to the main fact that James was stoned to death, the traditions agree. It is evident that the animosity of the Jews even against the most conservative—if the term may be allowed—of the followers of Jesus was growing fierce. The lines between the adherents of orthodox Judaism and the believers in the Nazarene were more and more sharply drawn. At length, in the year 66, the great insurrection against Rome burst out. In the blaze of the popular fanaticism there was no safety for Christians within the walls of Jerusalem. The church there was broken up. When the epoch of the mortal struggle of Judaism with Roman power was fast approaching, the Jewish Christians must necessarily find that the middle position which, in a certain sense, they had held, was no longer tenable. There were circumstances which might tempt them to give up their faith in Jesus, and to find their comfort exclusively in the old system in which they had been bred and whose ceremonies they still observed. They had hoped for the conversion of their countrymen, but that hope grew more and more faint. They had hoped for the reappearance of the ascended Messiah, but where was the promise of his coming? Patriotic instincts might naturally awake to a new life, and sympathy with the national enthusiasm impelling to a revolt against

foreign domination, might find a lodgment even in Christian hearts. There stands in the canon an Epistle to the Hebrews, concerning the authorship of which opinion has been divided from ancient times. At the present day there are few scholars who attribute it to Paul. Some, with Luther, ascribe it to Apollos; others to Luke, or to Barnabas. Whoever the writer was, it is certain that it was addressed to Jewish Christians. The purpose of the author, moreover, is clear. He sees a danger and he is striving to ward it off. He seeks to deter Jewish believers from lapsing from their faith and returning to Judaism. He is anxious to show them that they have in the Gospel a treasure infinitely more precious than anything offered them in the old ritual, and that the ordinances and ceremonies of the ancient Covenant are but types of blessed and enduring realities brought to them through Christ. To go back to the old sacrificial system is to give up the substance for the shadow.

If there was a retrograde movement, a reactionary tendency in some minds at this critical era, when the fate of the Jewish state and the Jewish religion hung in the balance, the same circumstances would engender in another class an opposite feeling. They would cling to the Christian faith with redoubled ardor and firmness. The tie that still held them to the old ceremonies would be loosened. The rejection of the Messiah by the Jewish people, and the persistent rejection of him, with the attendant fact of the astonishing spread of the new faith among the Gentiles, must have tended to open the eyes of many to a more just and liberal interpretation of the purpose of God. A fatal blow was dealt at Jewish Christianity by Divine Providence — the same Providence which had been the teacher from the beginning, removing, step by step, prejudice and misconception. No doubt there were those with whom the legions of Titus were more effective than persuasion and argument. The "logic of events" could not be disputed. Many Jewish Christians must have seen in the ruins of the Temple a sign of the passing away of the ancient system of worship. When the Jewish rites were wholly forbidden in Jerusalem, and it was converted by Hadrian into a heathen city (A. D. 135), the lesson was taught afresh with an irresistible emphasis.

It was probably about the time of the beginning of the Jewish war, and after the death of the Apostle Paul, that there was a migration of a number of Jewish Christians to Asia Minor. Among them were the two Apostles Andrew and Philip, and among them also was the Apostle John. John took up his abode at Ephesus. Traditions of his life and teaching and traces of his influence remained in all that region. There, in his serene old age, he wrote his Gospel and Epistles. From one of his pupils, the martyr Polycarp, Irenæus in his youth heard personal reminiscences of the Beloved Disciple. It is the same Apostle who, long before, had given to the Apostle to the Gentiles "the right hand of fellowship." After all these years, after the providential occurrences which had swept away the hope of the conversion of the Jews as a body, it would be strange indeed if no further advance had been made in catholicity of perception. The sayings of Jesus, which indicate the spiritual and universal nature of the Gospel, are present in John's recollection. He remembered that Jesus had said that the worship of the Father was not to be confined to Mount Gerizim or to Jerusalem. Christianity was now set free from Judaism, and in the second century Judaic Christianity survived only in sects beyond the borders of the Church.

To revert for a moment to the causes which brought on this result, the historical events to which reference has been made have an important place. The subjugation of the Jews by Hadrian and the exclusion of their worship from the Holy City were of especial consequence. An essential condition on which the result depended was the multiplying of churches made up of Gentile converts. The rapid spread of the Gospel in the Gentile world and the comparative fewness of its Jewish adherents excited surprise even in the lifetime of Paul. It was to him a mysterious fact, a fact that called for explanation. It had a great influence in molding the institutions of the Gospel. But underlying all these agencies was the leavening influence of the teaching of Jesus. The catholic elements of that teaching produced their legitimate effect. They were the warrant for the doctrine of the Apostle Paul. It was Jesus and the teaching of Jesus that liberated Christianity from the entanglements of Judaism.

George P. Fisher.

TO YOUTH.

TOUCH love with prayer.
It is a holy thing;
No dove with snowier wing
Fanned Eden air.

To mortal care
Heaven's whitest angel, Truth,
Intrusted it. O Youth,
Touch love with prayer!

THE "MERRY CHANTER."

BY FRANK R. STOCKTON,

Author of "The Lady, or the Tiger?" "Rudder Grange," "The Hundredth Man," etc.

XIV.

WHAT GRISCOM BROTHERS GOT OUT OF A
PUMPKIN PIE.

BY the bright light of the fire I took a good look at Griscom Brothers. He appeared to be about fifty years old, with a merry countenance, small eyes, grizzly side-whiskers, and below his white paper cap a little curly grizzly hair. It was plain that he liked to talk, and that he was well satisfied with his present position.

"Now," said he, looking from side to side, "I know who you all are. You are the people from the schooner out here in the bay; and as I've told you who I am, we may call ourselves ac-

quainted, and I'll go on and tell about the ghost business without asking any questions of you; at least not now.

"I've often noticed," said he, giving himself a little twist in his chair, "that when a man sits down, fair and square, to tell a story, it happens time and again that the story don't step up to the mark as lively as it ought to; and when it does show itself, it is n't as much of a story as it was expected to be. I should n't wonder if my story should be that way; but I'll take it by the nape of the neck and bring it right in, and let you folks see all there is of it.

"It was about twelve year ago, when my brother died and my family got to be only me, that I found I did n't get sleep enough. You see that being a baker I am obliged to go to my work very early in the morning, mostly about three o'clock, and that if I don't get a good sleep in the first part of the night, it will tell on me. You know that sort of thing will tell on people. Now the room I slept in after my family became so small was Mrs. Springer's second floor back, and every Tuesday night the Dorcas Society used to meet there, and them women kept up such a chattering from before dark to nobody knows how late at night, that I might as well try to make

good bread of brick clay as to sleep; meaning no offense, of course,"—turning from one to the other of the ladies,—“if either of you belongs to a Dorcas Society.”

"Which I do not," said Doris; "and if I did I would n't mind."

"Now, you see," continued Griscom Brothers, "when a man loses his night's sleep on one night in the week, he is very like to get into the habit of losing it; that's what I did, and could n't stand it. At that time this house was empty, the law having not decided who it belonged to, and it came into my head that it would be a good thing to come over here and sleep. There would be no Dorcas Society here, or anything else to disturb me. So here I came, finding it easy to get in at one of these kitchen windows; and I fixed up a bed in an upper room, and there I could sleep like a toad in a hole. Of course I did n't want to hurt Mrs. Springer's feelings, and I never said nothing to her about my not sleeping in the house. I went upstairs every night at my reg'lar bedtime and I rumbled up the bed and went away, Mrs. Springer not knowing whether I left the house at three o'clock in the morning or nine o'clock at night. You see I'm very spry at getting about without people seeing me; and to this day Mrs. Springer does n't know that for the last twelve years I have n't slept in her house except on some very stormy nights."

"Paid for your room straight along, I guess," remarked the butcher.

"Yes, sir! As I did n't pay nothing here it was all right I should pay there. Well, after I had kept up this thing for two years, you and your sisters," turning to Dolor Tripp, "came here to live, and then you may be sure I had a hard nut to crack. I had become so accustomed to this big, quiet house that I did n't believe I could sleep under any other roof, and so I said to myself, 'I'll stay here, and these people sha'n't know it any more than Mrs. Springer does.' There's a loft over this kitchen which you can't get into except by that trap-door and a ladder, and so before you came here I put the ladder up into the loft, and put a bolt on the other side of the trap-door, which kept me private. I knew you would n't want to use the loft, and I thought I might as well have it as not."

"And you 've been sleeping there for ten years!" exclaimed Dolor.

"That 's about the time," said Griscom Brothers. "I put everything into that room to make myself comfortable,—not your things, but my things,—and I got in and out through a little window in the roof. There are some strips nailed on for a grapevine, and these I used for a ladder. I can go up and down in the darkest night just like stairs. I can get into the house just the same as I used to, because the lock on the back door of the main house is one I put there myself, years ago, and of course I've got a key to it. Not long after you came I got to going over the house again, principally to see if the doors and windows were all shut and fastened. You was a little girl then, and you had a way of going out of doors after your sisters had gone to bed. You never thought of shutting up when you came back. When you got to be a big girl, and even a young woman, you did the same thing. So I kept on taking care of things."

"It strikes me," said Lord Crabstairs, who had been listening very attentively to the baker's story, "that you had rather an odd way of getting a night's sleep. Rambling through a house and playing ghost is n't the way to refresh a man, I take it."

"Now, you see," said Griscom Brothers, "the p'int of it is this. When I was at Mrs. Springer's I could n't sleep if I wanted to, but in this house I could go to my little room and sleep whenever I felt like it; that makes all the difference in the world."

"Yes," said the butcher; "being able to do a thing is often just as much good to a person as doing it."

"Now tell me another thing," said Lord Crabstairs. "What did you mean by that pumpkin tart?"

"Tart!" exclaimed the baker.

"That 's all right," said the butcher. "We tossed up, and tart it is."

Griscom Brothers did not seem to understand, but he went on to explain.

"That was an ordered punkin pie. It is n't the season for that sort of thing, and nobody but me has got any punkins kept over. But old Mrs. Gormish ordered the pie for her grandchild's christening, but when they sent for Mr. Black he could n't come, and they had to have Mr. Startling, and he's a dyspeptic, and so the old lady sent word to me she did n't want no pie, and it was left on my hands. I always like to have something to eat before I start out in the early morning, so I brought this with me, for there is n't no call for them. When you people came into the kitchen I was fast asleep, but I jumped up quick enough and hurried down to see what

was the matter. I was at the window seeing and listening to pretty nearly all you did and said; and when I heard you talking about being so hungry I thought of giving you that pie, and I locked the door to keep you in the kitchen until I thought I had done my duty by you."

"You did it well," said Doris, "for that was a good pie."

"I dare say," said Lord Crabstairs, "that in this country bakers don't sell meat."

"No," said Griscom Brothers; "as a rule they don't."

"Well, then," said his lordship, "as we are pretty well dried and warmed, and as there is nothing more to eat, we might as well be getting back to the ship."

We all agreed that this was the proper thing to do, and we rose from our seats.

"Before you go," said Griscom Brothers, addressing Dolor Tripp, "I want to settle one thing. Do you object to my staying on in that little loft, or must I go back to Mrs. Springer?"

"I think," said Dolor Tripp, "that it would be much better for you to stay where you are for the present. I am going to Boston, and when I come back I will speak to my sisters about it."

"Then I'll pack up my goods," said Griscom Brothers, "the day you come back, for I know what your sisters will say."

As the baker finished speaking he turned suddenly, and his eyes fell upon the schoolmaster, who until this moment had been keeping well in the background. For an instant the two gazed steadily at each other, then Griscom Brothers exclaimed, almost screamed:

"Johnny!"

The schoolmaster, with his long arms extended, rushed upon the other, and in a moment they were folded in a close embrace.

The pie-ghost was the schoolmaster's father.

For a few moments nothing was said, and we gazed in amazement upon the embracing couple. Then the butcher beckoned us a little apart and said in a low voice:

"That young man ran away from home more than twelve years ago. I did n't know him, for all that happened before I came to these parts, but I have often heard the story. I should n't wonder if he has been as much afraid of meeting his dad as of running afoul of Mrs. Bodship."

Griscom Brothers now stepped forward, holding his son by the hand.

"Ladies and gentlemen," he said, "who could have thought it, that old Mrs. Gormish's punkin pie should have given me back my son! For if it had n't been that she threw the pie on my hands I should n't have brought it here, and if it had n't been here I should n't have tried to give it to you, and if I had n't

done that you never would have ketch'd me, and if you had n't ketch'd me I should n't have known that my Johnny was with you."

"It strikes me," said Lord Crabstairs, "that you ought to thank the clergyman who ate his meals so fast that he gave himself dyspepsia. If he had been able to eat pumpkin tart you would n't have found your son."

"Tart!" ejaculated the baker.

"Tart it is," said the butcher; "tossed up all square. And now I think it is time for us to be moving."

"Johnny," said Griscom Brothers, "won't you stay with me to-night? My bed is wide enough for two."

But the schoolmaster hesitated, and finally said he thought it would be better for him to go back to the ship, for he had certain work to do in the morning.

We should have exclaimed against any ship work taking this new-found son from his father, but it was quite plain that the schoolmaster did not wish to stay. Perhaps he thought that if he walked across the country in broad daylight and without the protection of our company Mrs. Bodship might pounce upon him in spite of his disguise.

"Very well," said his father. "Perhaps it's better for you to go; for if you staid here we should talk all night, and neither of us get any sleep."

The schoolmaster now took his butcher's gown from the crane, where in the course of its frequent shiftings it had received a number of broad black stripes, and put it on.

"I suppose there are reasons for your wearing that," said his father, "but I won't ask them now. If you don't sail too early in the morning, I'm coming to see you on board the ship."

"We shall be delighted to have you visit us," cried Doris; "and the ship shall not sail until you arrive."

Preceded by Griscom Brothers, who carried the candle, we now left the kitchen. When we reached the long hallway our leader stopped, and, addressing Dolor Tripp, said that before she went away he would like to show her the picture that her sister was painting of her.

We all declared that we should like to see that picture, and the baker led us into the dining-room.

"You need n't be afraid," he said, as we walked after him, "of waking up Alwilda and Lizeth; I never knew two women sleep like they do. I believe their eyelids shut with a snap at nine o'clock, and open with a click at six in the morning."

The dining-room was large and high, with plain, smooth walls entirely unadorned except by a row of pictures painted on the smooth

plaster, at about the eye-line, and intended to extend all around the room. The line on three of the walls was nearly completed. These pictures had all been painted by Alwilda, and the style of them proved that she had been to a great extent her own teacher. The subjects were various, and some of them quite astonishing. We did not examine the whole gallery, but proceeded to the latest picture, which was yet unfinished.

This painting, about a yard square, represented Dolor Tripp lying drowned by the seashore—this being the fate which her sister expected would befall her while voyaging to Boston. The wretched plight of the recumbent corpse made us shudder, and the subject of the sketch covered her face with her hands.

"It is outrageous! it is shameful!" cried Doris. "Such a thing ought not to be allowed to exist!"

"Which it should n't," said Lord Crabstairs, "if I had a pail of whitewash."

"And a brush," added the butcher.

"I have that," said Doris, who had been looking about her, and had perceived the artist's materials near by.

Doris was an amateur artist, and, moreover, was quick to think and act. With a palette, a few colors, and some brushes, she stood before the picture, Griscom Brothers holding the candle. The pallid features of the drowned maiden soon began to glow with rosy health; her eyes were closed, but it was plain she slept; the sands and shallow water about her changed into soft, green grass, and the tall, slimy weeds which had thrown themselves about her form were now green, wavy stems with somewhat too brilliant blossoms. Even the rocks were covered with soft moss, and the whole scene changed so rapidly under Doris's brush that we were filled with an admiration we did not hesitate to express.

"I am glad you like it," said Doris. "I am sure there's nothing soaked or dead about Dolor Tripp now."

"When Alwilda Tripp sees that," said Griscom Brothers, "she'll think there's been a miracle."

"Which there has been," remarked the butcher; "an out-and-out square miracle."

"I don't know what she'll think," said Dolor Tripp, "but I know what I think"; and she kissed Doris.

I think we all would have been delighted to be in that room when Alwilda came down in the morning, but we spoke no more upon the subject, and quickly left the house.

"I'll lock the door and make everything all right," said Griscom Brothers, "and soon after breakfast I shall be down at the shore ready to be took on board."

The schoolmaster picked up his tall silk hat, which still rested on the top of the sand-piper's cage, and put it on; then he took up the cage, looked in at the bird, and was ready to go.

"Bless my soul!" exclaimed Griscom Brothers, "you look like a holiday butcher that's been half broiled. If you are going to slaughter that bird, don't do it until I come in the morning."

We now took leave of the baker and left the yard by the opening in the fence, after which the loose palings were restored to their proper position by the butcher. Though the moon was bright, we had some difficulty in finding our way on account of the fog which was coming in from the sea; but the butcher was now our guide, and without serious mishap or much detention we reached the shore, where we had left our boat. But when we had embarked we found the fog on the bay so thick that we could not see a boat's length in any direction. The schooner, however, was not far from shore, and we thought we could easily reach her; but in this opinion we were mistaken. We rowed and rowed, and still did not reach the ship. How we could have taken a wrong direction none of us could imagine, but we turned the boat and rowed and rowed again.

"Can it be possible," cried Doris, "that our ship has sailed away?"

"Absolutely impossible," said the butcher, with much fervency.

We now rowed about, this way and that, for at least half an hour, and I think we all began to be afraid that perhaps we had drifted out to sea. Suddenly the butcher laid down his oars and requested us all to be quiet; then standing up in the boat he flapped his elbows two or three times and gave forth a loud cock-a-doodle-do! There was an instant's silence, and then not far away from the stern of the boat there came an answering cock-a-doodle-do!

We all knew that this came from the cock in the rigging of the *Merry Chanter*.

In five minutes we were on board.

"Past midnight," said Captain Cyrus, whose watch it was.

XV.

WE ARE LOYAL TO THE "MERRY CHANTER."

EARLY the next morning the fog cleared away, and soon after breakfast we heard a hail from the shore.

"It's father," cried the schoolmaster, who was engaged in giving the usual morning attentions to the sandpiper.

And, sure enough, looking shoreward, we saw Griscom Brothers waving something white in his hand as if it were a flag of truce.

Captain Cyrus went after him in the boat, and very soon the good baker was on board.

Bidding us all a cheery good-morning, he handed the white article to the butcher.

"Here is your gown," he said, "which you left on the grass last night; and it's a very good thing you did so. If you want to know why, I'll tell you."

We all wanted to know why, and he told us.

"You see," said he, "we always serve the Tripp family with bread on Saturday morning, and this morning I thought I would deliver it myself. I found Lizeth Tripp at the chicken yard, and she was looking as if she had had a bad night.

"Did you sleep well?' I asked, feeling a little nervous, I must say, fearing she had heard something in the night.

"Oh, I slept well enough," said she, 'but I've seen sights this morning.' 'What sights?' says I. 'Just listen,' says she. 'When I opened the window early this morning the first thing that I saw was something white lying flat on the grass, with its long arms stretched out, as if it was dead. It made me jump, I tell you, for at first I thought it was a spirit, but it was so flat and thin that I next thought it was only the skin of a spirit.' 'Which I did n't know they shed them,' says I. 'Nor I neither,' says she. 'But I tell you it frightened me, and I jumped back from that window and went downstairs; and something seemed to move me to go into the dining-room and look at the picture Alwilda was painting, and when I saw it I was struck worse than ever. I tumbled back into a chair, and for ever so long I could n't move for staring. By good luck Alwilda did n't come into the room, being busy with breakfast. And now I have just come out to ask the hired man to take a pitchfork and carry off that skin or whatever it is, but he has gone away, and I'm mighty glad to see you. I wish you'd come into the dining-room and look at the picture.' So, as innocent as a lamb, I followed her into the dining-room, and looked at the picture which you, madam, touched up last night. I must say that, seeing it in the daylight, the young woman in the grass looked as if she had died of a raging fever in the middle of a lot of red-hot flowers. 'What's the matter with it?' says I, as innocent as if I had n't seen the thing done. 'It's been changed,' says she. 'It was a picture of a soaked corpse, and now it's a sleeping beauty; and if the spirit of Dolor Tripp did n't change it, I'd like to know what spirit did. If she was really lost at sea that's just the way she'd come back to comfort us.' 'Now look here,' says I, 'I don't believe in spirits anyway, and if there was any, they could n't paint.'

"Having been a ghost myself," he said, look-

ing round the company with a smile, "I ought to know what they can do.

"Now then," says I to Lizeth Tripp, 'it's my opinion that your sister Alwilda began to feel bad about this picture, and so she altered it herself. Now if I was you I'd rub out the whole thing—that is, if it can be rubbed out.' 'I can clean it all off the wall,' says she; 'for I've often seen Alwilda do that thing when she did n't like a picture and wanted to paint it over again.' And with that she went and got a steel thing like a hoe, and scraped every scrap of that picture off the smooth wall. 'There should n't be no such picture in the house,' says she, 'whether it's of a drowned sister, or of one asleep on the broad of her back in the middle of a field; and as fast as Alwilda paints them I'll scrape 'em out.'

"Now it seems to me," said Griscom Brothers, "that I got us all out of that scrape pretty well."

"That's your way of looking at it," said Lord Crabstairs; "but it strikes me that that Lizeth Tripp is going to get herself into a lot of scrapes if she keeps on scraping out her sister's pictures."

"Well," continued the baker, "there was n't nothing left to clear up but that white thing on the grass, and when I looked at it I told Lizeth it was nothing but a butcher's gown, that most likely had blown over there in the storm. I did n't know it was yours until I picked it up and saw your name on it. So I said I'd take it away with me; and I left as quick as I could, for I did n't want to have to clear up anything more."

We all agreed that Griscom Brothers had done his part well, and he now retired to the bow of the ship to hold converse with his son.

Dolor Tripp was very anxious that this conversation should be speedily terminated, so that we might sail away. She feared that if there should be a quarrel between Alwilda and Lizeth on account of the one scraping out the pictures of the other, it might become necessary for her to go home and act as peacemaker; but if she were actually on her way to Boston, this of course would not be possible.

Captain Timon, however, assured her there was no hurry, and that Griscom Brothers would have time to talk with his son as long as he liked.

In half an hour the baker left us.

"I don't suppose you'll sail on Sunday," he said; "and if you don't get off to-day, I'll come on board again to-morrow."

"We shall never sail on Sunday," said the butcher, speaking very positively indeed.

I looked at the butcher, and he looked at me, and we both looked at Captain Timon, who looked out over the sea.

We did not sail on Sunday, and on Monday evening Doris took me aside for what she called a serious conversation.

"It seems to me," she said, "that as owners of this ship we are not doing our duty by our passengers. The butcher came on board and paid his passage to Boston; we are not taking him to Boston. Lord Crabstairs came on board to go to Boston; he paid his passage, and we are not taking him there. The schoolmaster came on board to go somewhere, and we are not taking him anywhere. It is true he paid for no passage; but we promised to take him to Boston, and we are not taking him. Dolor Tripp is worse off than the others, because she is really afraid that if we do not soon start something will make it necessary for her to go home. As for ourselves, we have taken our chances, and must be content; and as to the four captains, they also have taken their chances. They undertook to sail the *Merry Chanter* to Boston, and if they are delayed on the voyage it is no more our affair than it is theirs. But when people pay money for their passage it is a different matter."

I had been fishing that day with Lord Crabstairs, and had had very good luck. I expected to go out again the next day, and I said to Doris that for the present I thought we were all very well off as we were.

"I am very well satisfied to wait," said Doris, "for it is very pleasant here and our living is certainly cheap; but that has nothing to do with our duty towards our passengers."

"What can we do for them?" I asked.

"We can do one of two things," answered Doris. "We can pay them back their passage money, or send them to Boston by rail."

"Either one of those things would be pretty hard on us," I said, "especially after having boarded and lodged them all this time."

"That has nothing to do with it," said Doris. "Justice is justice, and we should not take their money and keep them waiting and waiting here for an exceptional high tide."

I reflected a few moments. "It would be well," I said, "to find out what they think about it. Let us call a meeting of the ship's company."

"Good!" cried Doris; "and you must preside. You are the proper person to take the chair."

After supper the meeting was called, and the whole population of the ship, including Griscom Brothers,—who had come on board for an evening visit,—attended.

"Ladies and gentlemen," said I,—and the moment I had uttered these words I knew that I had made a mistake. I should have said "shipmates," or something of that sort, but I went on,—“my wife and I have concluded that

we are not doing our duty by you. We do not know exactly when we shall be able to sail, and we have thought that it might be better to send you to Boston by the railroad."

At this a little murmur seemed to run through the company, and Doris interrupted me.

"My husband does not mean," she said, "that we have decided to send you to Boston by rail. What we desire is, to give you an opportunity of expressing your feelings in regard to the situation. You have paid your money, and you are entitled to a passage on this ship to Boston; but if you think you would rather not wait any longer, we will consult together and see what it will be best to do. It may be that you would like to go to Boston by rail."

At this another murmur, louder than the first, was heard from the company, and the butcher rose to his feet.

"Is a motion in order?" he asked.

"Yes," said Doris.

I felt that I was presiding over this meeting in rather an odd way, but the oddity did not seem to strike any one else, and the butcher put his motion.

"I move that we stick to the ship," said he.

Lord Crabstairs leaned towards Dolor Tripp. "What do you think about it?" he asked.

"If I do not go to Boston in this ship," she answered, "I shall not go at all."

"Second the motion," called out Lord Crabstairs.

"Before the motion is put," said Doris, "we ought to hear what the captains have to say about it."

The four captains stood in a row on the starboard side of the deck. Being older and more accustomed to speak, Captain Timon answered for his fellow-mariners.

"Well," said he, "each of us puts some money into this venture, and of course we don't want to lose it. If we don't get to Boston our money is lost. If that money is lost, we want to be able to say that it was n't lost because we gave up the v'yage too soon, but we want to be able to say it was lost because a gale of wind and a high tide did n't come into Shankashank Bay together. Of course that gale and that tide may never come in together, but we're in favor of givin' them a leetle longer chance. A good many things in this world would do a sight better than they do do if they had a leetle longer chance. So we four are in favor of stickin' to the ship."

He looked at his companions, and each one gave an affirmative nod.

The question was put, and it was unanimously resolved to stick to the ship.

"Three cheers!" cried Doris. And the ship's company gave three hearty cheers.

During the meeting Griscom Brothers had

neither voted nor spoken, but he cheered with the others.

"Not being an owner, a passenger, or a captain," said he, "of course this is n't my business, but I'm mighty glad to see you're going to stand by the ship. It is n't everybody that's got a ship to stand by. That's what I said to my Johnny. 'Stand by the ship. If you're going to Boston, go. When you come back, I'll take you into the baking business, or you can keep on with your schoolmastering; but whatever you do, you must stick to it.' That's what I said to my Johnny. And now I say to the rest of you, if you don't sail to-morrow morning I'll drop in and see you in the afternoon."

"It's my opinion," said the butcher to us when Griscom Brothers had gone on shore, "that the schoolmaster would rather go to baking than go to sea, but he's afraid to show himself on land till his father has settled matters with Mrs. Bodship. If any man can do it Griscom Brothers can do it, and he's promised to try."

XVI.

DOLOR TRIPP SETS SAIL.

THE very next day a gale came into the bay with a flood tide; but although the wind was strong enough to stir up a very fine storm, it did not blow enough water into the bay to float the *Merry Chanter*.

Our four captains were all ready to take advantage of the first indication that our ship was free to ride the waves; but no such indication came.

"I'm afraid she's voted to stick to the sand bar," said the butcher, when the tide began to ebb.

With this exception, none of us showed any signs of giving up hope. There would be another high tide in twelve hours, and the gale might increase in violence.

But although the storm did not move our ship, it greatly delighted some of our company. The bow of the vessel pointed out towards the sea, and for nearly the whole day one or the other of the ladies stood there enjoying the storm. When Doris occupied this post I was with her, and when Dolor Tripp was there the butcher stood on one side of her and Lord Crabstairs on the other.

They could have had no better opportunity of thoroughly enjoying the storm. The waves rolled in, sometimes dashing up to the very feet of the figure of the *Merry Chanter*, and sometimes throwing the spray over his head and into our faces. The wind whistled through the cordage and blew the cock from the rigging. Fortunately he alighted upon the deck, where he had not set foot since he had been brought

to the ship, and he ran screaming and flapping to the coops where the other fowls were sheltered.

It seemed to me that Doris and Dolor Tripp could not get enough of this turmoil of the elements.

"To see it all and be in it," said Doris, when we had gone down to the cabin for a brief rest; "to feel the storm and not to be afraid of it; to look upon the rolling, tossing waves and yet feel the deck as immovable as a floor beneath our feet; to fancy we hear the Merry Chanter shouting his sea-songs into the very teeth of the storm — it is grand! it is glorious! and it is perfectly safe!"

For my part I very soon got enough of the turmoil of the elements, and I fancy that the butcher and Lord Crabstairs were satisfied as easily as I was; but although I frequently entreated Doris to shorten the time of her observations at the bow, I do not believe that the supporters of Dolor Tripp gave the least sign that they did not like the sea wind almost to take away their breath, or the sea water to dash into their faces and drench their clothes. The young woman was enveloped in a waterproof cloak and hood; and although the butcher possessed a garment of this kind, he would not put it on, because by so doing he would have confessed himself less able to endure bad weather than Lord Crabstairs, who had forgotten to provide a mackintosh for the voyage.

Once I proposed to Doris to allow the schoolmaster to have the pleasure of gazing at the storm with her, but she indignantly repudiated the proposition.

"Look at those two men," she said; "do they flinch from the side of the woman they love?"

And of course after that I had nothing more to say about a substitute.

The storm did not increase in violence, but gradually subsided, and the next day was pleasant and clear. Doris occupied herself with her little chicks. The schoolmaster opened the cage of the sandpiper, which had become quite tame, and allowed the bird to take a constitutional upon the deck. The cock flew back to his old position in the rigging and crowed aloud his satisfaction at again feeling himself above us all. Everything seemed to be going on in the same quiet and pleasant methods to which we had become accustomed before the gale had tantalized us with a half hope of Boston.

But in fact everything was not going on quietly and pleasantly. Lord Crabstairs and the butcher were unquiet and unpleasant; that is, to each other. By the advice of Captain Timon they had established a system in regard to Dolor Tripp. After breakfast one of them would take the first watch, and at the end of an hour would relinquish his position by her

side to the other. When the second watch of an hour had ended, each of the men would give the lady an hour to herself, thus allowing her to be undisturbed until noon; after dinner each man went on watch for an hour, and then Dolor Tripp had two hours to herself. After supper there were no watches, because Captain Timon declared that as long as he commanded the ship he would see no woman overworked.

But this apparently amicable arrangement did not serve its purpose. It gave each man a fair chance, but each man wanted more. They had become of little social advantage to us, for the one who happened to be off duty was inclined to be silent and was continually looking at his watch.

As for Dolor Tripp herself, Doris and I could see no reason to suppose that she liked one man better than the other. With Crabstairs she was lively and beaming, and apparently delighted that it was his watch. With the butcher she was lively and beaming, and delighted that he was on duty.

"What 's wanted on this ship," said Captain Timon to us, "is one man less, or one woman more. If each of them fellers had a gal it 'd be all right, but one gal is n't enough for two of 'em."

"What would you do about it?" asked Doris, who was beginning to be disturbed at the turn things had taken.

"I 'd chuck one of them overboard," said the captain, "and let him swim ashore."

"Which one would you chuck?" I asked.

"The Englishman," said the captain. "If I 've got to haul down any flag, I 'd haul down the Union Jack before the Stars and Stripes."

"That would n't be fair," said Doris. "One has just as much right as the other."

"I suppose that 's so," said Captain Timon, with a grin; "and as we can't chuck the young woman overboard, I guess we 'll have to let the matter settle itself."

"It seems to me," said I, when the captain had left us, "that a marriage with a British peer would be of much more advantage than a marriage with a butcher."

"I don't agree with you," said Doris. "Lord Crabstairs has repudiated his peerage, and the butcher has repudiated his butchery; they now stand on equal ground. Before Lord Crabstairs was overtaken and crushed by his title he was quite as free and independent a man as the butcher is, and now that he has escaped from his peerage he is again just as good as the butcher. He has told us he has a small income not derived from his father's family, and the butcher has saved money, so in every way they are even, and Dolor Tripp ought to be allowed to take her choice between them."

"The trouble will be," said I, "to induce her to make a choice. I think she likes to have two men courting her, and the affair will probably end in a fight on the *Merry Chanter*."

"I don't believe it," exclaimed Doris. "Neither of those men would so far forget himself as to fight on my ship."

"Your ship!" I said.

"Oh, I meant to say ours," she answered.

The next day the butcher took the first watch with Dolor Tripp. At eight o'clock precisely he offered her his arm, and invited her to walk the deck with him. I noticed that his face wore a serious expression, and that he was extremely deferential and polite to his companion, guiding her carefully around the wet places on deck, which were still damp from the morning's swabbing, and apparently paying the strictest attention to what she might be saying, as if he was anxious not to lose a word of her sweet speech.

In the mean time Lord Crabstairs appeared to be in a very unquiet mood. He was restless and excited, and finally filled his pockets with corn and ran up into the rigging, where he fed the cock, who for some time had been crowing for his breakfast. The moment that the butcher's watch had come to an end Lord Crabstairs scuttled down the rope ladder so fast that we were afraid he would slip and break his neck. In an instant he was at the side of Dolor Tripp, and, giving her his arm, rapidly conducted her to the bow of the ship, this portion of the deck being now untenanted. The butcher walked slowly towards us as we sat in our customary seats at the stern.

"You are going to lose a passenger," he said.

"Which one?" we cried.

"That depends on circumstances," said the butcher. "You see I made up my mind last night that things could n't go on as they were going on, and so right after breakfast I proposed to him that we should toss up and decide which should put the question to her. You see we'd agreed that neither of us should do that without giving the other notice. He was ready quick as lightning, and we tossed. He called 'heads,' and heads it was twice. And he's got her."

"But she may not accept him," cried Doris.

"Oh, she'll take him; there's no doubt about that," said the butcher, looking solemnly down at the deck. "If he proposes first she'll take him, and if I had proposed first she would have taken me. Neither of us had any doubt on that point."

Fifteen minutes later no one on board could have had any doubt on that point, for Lord Crabstairs and Dolor Tripp walked towards us, the one with a downcast, blushing face, and

the other with the most beaming, joy-lighted countenance I ever saw.

"You see," said Lord Crabstairs, "we have just stepped aft to announce our engagement. We did n't think it exactly the square thing in a small party like this to keep dark about it even for a short time."

"As if you could do it!" cried Doris. And then we congratulated the happy couple, the butcher shaking hands with each of them with a degree of earnest solemnity not common on such occasions.

Lord Crabstairs and his lady-love now went below to acquaint the schoolmaster and the four captains with what had occurred.

"And now," said Doris to the butcher, "what were you going to say about our losing a passenger?"

"Well," said he, "if they stay on board I go, but if they go ashore I'll stay here. I don't want to go back on my word about sticking to the ship, but circumstances often give a new twist to things."

"Indeed they do," said Doris, speaking in a very sympathetic tone and offering her hand to the butcher.

"I'm mighty glad of it," said Captain Cyrus to us a little while afterwards. "I don't know when I've heard anythin' that's pleased me better. For the life of me I could n't see how they were goin' to get out of that fix without its endin' in a row. It was only yesterday, madam, that I thought that if you was only disengaged it would be all right, for then there would be two young women, one for each of them; but you was settled for, and there was only one young woman for the two men. But now it's all straightened out and we can have peace on board."

I wish here to record the fact that from that moment I never made a voluntary observation to Captain Cyrus Bodship.

XVII.

HOW LIZETH AND ALWILDA TOOK IT.

WHEN Griscom Brothers came on board that afternoon and heard the news he was delighted.

"I thought it would come to that," he said. "Title is bound to get ahead of meat. And what do the happy lovers intend to do? Will they remain on board and go to Boston?"

"No," said Doris; "they leave us this afternoon. Dolor Tripp is in her cabin packing her trunk. She will go home to her sisters, and Lord Crabstairs will lodge in the village, where he can go and see her every day. They are to be married as soon as possible."

"I am mighty glad," said Griscom Brothers, "that Dolor Tripp is going home; she's needed there. Ever since Lizeth scraped out Alwilda's

picture them two sisters have n't spoke. That sort of thing has happened before. As much as six weeks or two months has passed without either of them speaking a word to each other, and at such times Dolor has to be a sort of go-between to tell one what the other wants. They 've had a pretty tough pull of it this time without her."

"What do they do," I asked; "make signs to each other?"

"No," said the baker. "When one of them has to ask something of the other, she goes out to the hired man and tells him to go into the house and speak to her sister. But his boots are so dirty that they never do this unless they are positively obliged to. Lizeth told me that yesterday she was nearly starving for butter because she could n't make up her mind to tell that man to ask Alwilda where she had put the milk-house key."

Dolor Tripp now came on deck ready to go ashore, and in a few moments Lord Crabstairs appeared, glowing with ruddy joy, and loaded with a huge valise, a bundle of rugs, a hat-box, and a collection of umbrellas and canes.

Their intention was to go together and acquaint the sisters of Dolor Tripp with what had happened, and ask their blessing. Doris thought it was the proper thing for her to go with Dolor, and as it promised to be an interesting occasion I thought it the proper thing to go with Doris. Griscom Brothers said that on his way to the village he could stop at the Tripp house just as well as not, and that he would do it; whereupon the schoolmaster remarked that as the party would be so large he would not be afraid to go with them himself. At first the butcher seemed inclined to stay on board, but after taking me aside and remarking that if he did not go with us it might look as if he were showing bad feeling in the matter, he joined the party.

Only the four captains remained on the *Merry Chanter*. These faithful mariners must be at their posts in case the exceptional wind and the exceptional tide came into the bay together.

Our boat had to make two trips before we were all landed, and then we walked to the house. Griscom Brothers and the schoolmaster carried the huge valise, in order that Lord Crabstairs could give one arm to his lady-love; and the butcher, to his honor be it said, relieved his late rival of the hat-box and the package of umbrellas and canes. Dolor Tripp said she could send the hired man for her baggage.

We found Lizeth in the poultry-yard.

"Lizeth," said Dolor Tripp, blushing a little, "this is Lord Crabstairs."

"Lord which?" exclaimed Lizeth.

"Crabstairs," replied her sister; "and we are going to be married."

Lizeth looked at them in astonishment. "You two!" she exclaimed.

"Only the two of us," said Dolor. "And I want you to like him, Lizeth; you ought to like your brother-in-law."

"Do you mean to say," said Lizeth, speaking slowly, "that this man is a sure-enough foreign lord?"

"Yes," said her sister; "he's an out-and-out peer of the British realm."

Lizeth looked as if she were going to whistle, but she did not.

"It is a fair and square thing for me to say," remarked Lord Crabstairs, "that I am a lord against my will, and my title brings me no property except two centuries of debts."

"But you really are an English nobleman?" asked Lizeth.

"Yes," said Lord Crabstairs, "I am."

Lizeth now looked steadfastly at her sister and at the sturdy Englishman by her side. Then she looked at the rest of us, and then spoke.

"I don't believe in monarchies," she said, "nor in kings, nor in crowns and scepters, nor in aristocracies, nor in peers and realms. I am a plain, free-born, independent republican, and look down upon empires and thrones. My ancestors did not come over in the *May-flower*, but I am quite sure that they came in a plain wooden ship, and did n't put on any airs. As I said before, I've nothing to do with peers and peeresses, nor kings and queens. I am a free-born American, and a free-born American I shall die, but if he really is a lord I suppose he can have you." Dolor Tripp hung upon her sister's neck and kissed her, and then we all went to make the announcement to Alwilda.

We found the elder sister in the dining-room painting a picture upon the wall. She was at work upon a small blue house, surrounded by flowers and shrubberies of the brightest and gayest colors. Birds with brilliant plumage were flying through the air; there was a sunset glow in the sky; and a young woman with a red shawl and a yellow petticoat was playing a harp in the foreground.

Dolor Tripp was so struck by this work of art that she was obliged to satisfy her curiosity about it before stating the object of her visit.

"What in the world is that, Alwilda?" she exclaimed.

"That," said the artist, stepping back from the wall, but taking no notice of the presence of our party, "is a home in the midst of all sorts of things that are joyful to look at or to listen to or to smell; but in spite of all that the person that lives in the house is blue, and everything in it is blue, and the very house itself is blue."

"Do you live in that house?" asked her sister.

"At present I do," was the answer.

"Well, I am come to make your house a livelier color," said Dolor Tripp. "Alwilda, this is Lord Crabstairs."

The tall woman turned the front of her black-and-white sunbonnet upon his lordship. "What does he want," she said; "some more chickens?"

"No," said Dolor Tripp; "he wants me."

Alwilda looked steadfastly at the couple, now holding each other by the hand.

"A lord?" she said.

"Yes," said her sister; "really and truly an English lord."

"You are quite sure," asked Alwilda, "that he is n't a German count?"

"Of course not," replied her sister, hotly.

"Or a Spanish duke?" asked Alwilda.

"Ridiculous!" said Dolor. "How could he be?"

"Or a Highland chief, or an African king?" asked the other.

And at this we all laughed.

"Well," said Alwilda, "they are just as likely to say they are one of these things as another, and I don't suppose it makes much difference which it is. But if you two are really going to be married there is one thing I want to ask you. When you set up house-keeping, do you intend to have one single bedstead, and no more, in your spare room?"

"What in the world do you mean by that?" cried her sister.

"I mean," said the other, "that I want to know, when I come to see you, if I'm to have the spare room all to myself, or if there's to be somebody else there at the same time with me. If she's to be there," motioning out of doors, "at the same time that I am, then I don't want to go, and I don't want to have anything to do with your marrying, or your housekeeping. But if I'm to have the room to myself, then I suppose there's nothing more to be said."

"You shall have it," cried Lord Crabstairs. "I shall have a bedstead built, in which there shall not be room for two fishing-rods."

"Then, Alwilda," cried Dolor Tripp, "you approve of our marriage?"

"It's better than drowning," said her sister. "And taking it all in all," she continued, after a little reflection, "I'm rather glad you wanted to marry a foreigner. Americans are too uppish; but when you get hold of a man that is accustomed to being downtrodden, it's easy to keep him so."

At this Lord Crabstairs roared with laughter till the ceiling echoed, and we all joined in.

Alwilda did not smile, but looked from one to the other, and when the laughter had ceased she asked Griscom Brothers how much

she owed him for bread. The merry baker declared he did not carry his account with him, and then Lord Crabstairs stepped forward and spoke.

"I wish you to understand, madam," he said to Alwilda, "that your sister is not marrying a rich lord. My income is a very small one, and I shall be obliged to go into some work or other to support myself and my wife."

"Oh, money does n't matter," said Alwilda, turning towards her picture. "Dolor has money."

"I'd like to know where," exclaimed her youngest sister.

"In the bank," said Alwilda; "gathering interest."

"And you never told me!" cried Dolor Tripp, excitedly.

"Why should I?" answered Alwilda.

"What call had you for money? When you should come of age you were to have it, or when you should marry you were to have it. Now you and your African king will have it."

The statement that Dolor Tripp was possessed of a fortune, though probably a small one, created a profound sensation among us, and our congratulations were warm and sincere. We were about to depart when Doris addressed Alwilda.

"I would like very much to know," she said, "whether or not you now intend to alter the color of the house in your picture?"

"Well," said Alwilda, meditatively, "I think I shall paint the roof red, but I shall wait to see how things turn out before I change the color of the rest of the house."

"I tell you what it is," said Griscom Brothers, when we were outside, and he and Lord Crabstairs were starting for the village, "there will soon be an end to them two sisters keeping mum to each other. There's nothing on earth could keep them from talking about Dolor's getting married."

It was late in the evening when we reached the *Merry Chanter*, and our supper was much less lively than when Dolor Tripp and Lord Crabstairs were with us.

"I had begun to feel satisfied to wait here," said Doris, when we had gone on deck; "but now I am sure I shall feel lonely, and I think we must ask the captains to do their very best to leave the bay and start for Boston, even if the tide and wind do not exactly suit."

"Yes," said I; "we'll talk to them in the morning."

"What do you think about it?" she said to the butcher.

"Well," he answered, "I don't know that it's my place to give advice."

"I DON'T KNOW THAT IT'S MY PLACE TO GIVE ADVICE."

"You're too modest," said Doris.

Shortly after this the butcher took the opportunity to speak to me privately.

"If I were to marry that young woman who's left us," said he, "and she was on board this ship, and worrying and hankering to start for Boston, it strikes me I would tell her all about the sand bank and the barnacles and

the seventy cart-loads of paving stones in the hold."

I looked at him severely. "But you are not married to her," I said; "and not being married, you do not know what a married person should say to the person to whom he is married."

To this the butcher made no reply.

(To be concluded in the next number.)

Frank R. Stockton.

OLD AGE'S SHIP AND CRAFTY DEATH'S.

FROM east and west across the horizon's edge,

Two mighty masterful vessels, sailers, steal upon us:

But we'll make race a-time upon the seas — a battle-contest yet! bear lively there!

(Our joys of strife and derring-do to the last!)

Put on the old ship all her power to-day!

Crowd extra top-gallants and royal studding-sails!

Out challenge and defiance — flags and flaunting pennants added,

As we take to the open — take to the deepest, freest waters.

Walt Whitman.

A SIDE LIGHT ON GREEK ART.

SOME OF THE NEWLY DISCOVERED TERRA COTTAS.

VOLUMINOUS Pliny caught in the drag-net of his natural history the legend of the maid of Corinth who drew a line along the shadow on the wall made by her lover's profile, so that she might have something to remember him by when he was sailing the Ægean. She was the daughter of an early potter, and found her father sympathetic. Availing himself of his skill in modeling the decorations of pots, the kind man fashioned the features of the absent lover on the outline in relief, and placed the clay in his kiln to bake. Down to the time that Mummius took Corinth whosoever doubted the story was taken to the Nympeum and shown the terra cotta itself.

The pretty tale recurs to memory while examining groups and single figurines of terra cotta which have been appearing in Paris one by one since 1878 after a somewhat mysterious fashion. The point that strikes one first on turning over a specimen is the unfinished state of the back, which argues that these fragile creations were meant to be seen from one side only. A hole that is commonly found in the roughly finished rear suggests that they were hung against a wall on a peg, like many pieces of Japanese earthenware. The portrait modeled by Dibutades for his daughter offers a sufficiently appropriate beginning for the art. It savors of home and happy loves, while the terra cottas that are now coming into favor belong to the same department.

They are often cracked, and sometimes the mending has hurt them further, because attempts have been made to conceal the breaks. They are also, when untampered with, covered with the finely powdered remains of a suit of paint, so that we may place them with those gaudy figurines that are sold in Europe to-day at country fairs. They were meant to stand on shelf or in niche, if not to be suspended on a peg; sometimes they are arranged for both. In fine we have in them examples of the objects that Greeks of all ages saw about them in their small houses, placed in their shrines, gave to one another as presents, and offered to the ashes of their loved ones in the tomb.

Humble as the purposes of these statuettes may have been, they occupy a very serious of-

fice now, if we desire to embrace the general view of Greek art. Their beauty, variety, and archæological interest make them indispensable to any one who wishes to understand how intimate in the populace was the blending of a taste for lovely forms with the legends that offered chances for the expression of shapes in a plastic way. They throw a side light on Greek art that was much needed, notwithstanding the engravings on mirrors for women, the paintings on vases, the bas-reliefs of tombs, and all the other works that may be classed among the minor productions of Greek artists. Within the twelvemonth a pediment has been unearthed at Athens which offers an example of what we may consider the first step in the evolution of these charming pieces of popular sculpture. It is decorated with painting alone, and that without human figures. The groups in terra cotta, which have been appearing from Greece during the last ten years, seem to attach themselves to statuary for the pediments of temples by their general outline, their one-sidedness, and the nature of the subjects they commonly represent. Suppose we regard them as popular editions of works by masters, suited, by the material in which they are fashioned and the methods used to fashion them, to the slender purses of the people.

Southern Italy and Sicily yielded terra cottas that did somewhat to hint the existence in other parts of the Greek world of a popular decorative art taking rank below the restful creations of the old masters. But at Tanagra figures of baked clay have been found which were plainly the embellishment of the two triangular spaces over the two entrances to a small temple, representing Pluto and Theseus seizing each his bride. They were cast in a mold, not modeled on a core, and resembled the figurines in having the backs rude. Some were in comparatively low relief; but others, like the horses of Theseus and Pluto, were boldly projected from the centers of the pediments. The male and female figures appear to have been fastened by their flat backs to the wall, and are so arrangeable that the largest hold the middle and the stooping or smaller figures occupy the narrowing angles. In them we have the connecting link between the painted decoration of pediments and the sculptures in marble occupying the same place in the highest state of Greek art.

ÆSCULAPIUS AND HYGEIA WITH A DYING WOMAN.

The terra cottas shown in illustration belong to the Tanagran connecting link. They deal oftenest with stories of gods who were not, strictly speaking, the aristocratic deities of Olympus. The most popular of all is Pan, who does not visit Olympus at all, but dwells on the quadrilateral of hills that encircles Arcadia; also in a cave in the rock of the Acropolis at Athens, and on certain mountains of Thessaly. Pan has every attribute of a god of the under-folk whose idol, clad in hides

and smeared with the blood of sacrifice, gave the design which the Greeks refined into a hairy-legged satyr with the pipes. Bacchus is hardly less the object of this popular form of art. He too is a god who springs from the lower stratum of the people, and has traits hard to reconcile with Aryans. In truth he is another form of Pan, and the latter is associated for good reasons with the infant Bacchus. But there are other subjects for these ancient image-makers — scenes from the *Odyssey* in which

NYMPH WITH WINE-JAR AND GARLAND.

Odysseus wears a close-fitting sailor's cap and jersey. Or it is a genre scene without relation to mythology or legend, such as a Greek lady and gentleman fondling a foal. Many of the groups plainly refer to death. Again we come upon a plastic pun, a representation in clay of the adage *amor vincit omnia*—"all things" being of course *pan* in Greek, and identical in letters with Pan the god.

In this most exquisite group a youthful cupid with wide wings that fill the background leans down and helps to his feet a shaggy Pan; with his left he seizes the left wrist of the god and is in the act of lifting him from his disgraceful

position. Wings, fine floating cloak, beard and goatish legs of Pan are modeled in the rude clay with a truth, a breadth, an absence of worry over unimportant points which are indeed great art. Yet the composition itself is still greater. It is enough to make modern sculptors pale with envy to see the Asiatic Greek, or that sculptor of the Peloponnesus from whose creation this exquisite idea has been adapted, strike negligently and with a laugh, as if he were hardly conscious of its purport, the heart of a given subject.

Whence come these lovely creations? No one who knows will tell. It is fairly certain

that the dealers in Athens import some of them from Smyrna and others from Boëotia, but exactly whence is a secret which everybody concerned has the utmost interest in preserving. Nor is it likely that anything short of a quarrel among the finders will indicate the spot until the treasure-trove is entirely rifled. Those who have been in the Levant need not be told that the ordinary impulse of men to keep for themselves a good speculation is quadrupled in lands where arbitrary power is lodged in the hands of subordinate officials. Greece watches carefully the exports and seizes all antiquities at the Piræus. In Asia Minor, even, the old system of getting a firman and taking what the excavator may is no longer possible. The objects are the property of the Sultan, and are supposed to revert to the museum at Constantinople.

Whatever may be the land from which we get the statuettes, it is from internal evidence certain that they are Greek. To the archæologists who say that they are fabricated by clever forgers, it may be retorted, that if a forger exists who can do such work, nothing could stop his triumphant progress through the world as the greatest genius in sculpture who lives.

Lucian lived several centuries later than the date which may be safely fitted to these groups, but the gay incredulity that marks his writings, the wit of his best pieces, the liveliness and sparkle of his mind, suit wonderfully statuettes of this kind. His birthplace, Samosata, is far over on the upper reaches of the Euphrates; but though a Syrian he was more like an Asiatic Greek. He gives humorous account of the hopes built upon him by his father because as a school-boy he modeled cows, horses, and men in wax; but when he was placed to learn the trade with his uncle, a statuary, he earned by his frivolity such a beating that he went home in tears. It appears that not only his uncles but his maternal grandfather followed this very respectable trade. It would be interesting to know whether the heads and arms of the terra cottas were first modeled in wax and then a model made from which any number could be taken, or whether each was modeled directly in the clay for fixing on the molded body.

What Æsculapius, the god of healing, can be under the touch of statuary in an age of skepticism is seen from the group here given. Perhaps this group was sold in that famous sanctuary at Pergamus to which Caligula made pilgrimage in search of health. The pyramidal outline is here. The central figure is naturally the object of interest, but being from the circumstances of her state unable to stand, the back of her couch is carried up in a central pilaster, terminating in a finial above the heads of the assistants. The finial seems to repeat a conventional gravestone. Æscula-

pius stands before the dying girl and clutching his beard in the agony of thought; not indeed with a violent unGreek movement, but calmly. He leans on the high back of the couch with his left hand and puts his left foot backwards in front of the right. The attendant Hygeia has given up hope and bends her head forward at the angle human beings naturally assume when they weep, so that the tears will not flood the cheeks but fall direct. The central post recalls the stiff deity of superhuman size who stands in the exact middle of the pediments in classic periods, and divides the fighting, running, or couchant figures into two somewhat symmetrical halves.

Such outlines in a great number of the groups enable us to reconstruct the history of Greek art in its effort to give suitable clothing to the hard, bare, angular space of the pediment. The smaller terra cottas appear to have been fixed in the gables of sarcophagi which imitated the temple form; also on the tombs themselves, which in Asia Minor particularly are prone to assume the appearance of a small temple partly emerging from the rock, and have gables of a large size. But there were other places for those which were destined for the decoration of tombs; namely, within the sarcophagus itself, as well as on shelves and in niches of the tomb. To this quantity of terra cottas of different size and great variety of subject, in which we may suppose the religious genre predominated, add the statuettes which adorned the home of the deceased, and, being beloved by him, were placed near his corpse or his ashes. Hence the great quantity of figurines with no special attribute signifying either a divinity or a trade. They were the *bibelots* of the deceased, a man's minor art collections, a woman's favorite bric-à-brac, the artistic puppets of a young girl, the dolls of a child. Hence the countless pretty ladies in *himation* and walking cloak with their heads coquettishly hid, or a spruce hat high above well-combed, natty hair. In the house, suspended on wooden pegs or ranged on shelves that corresponded to our mantels, these were the familiars of the family without attaining to the dignity of household gods or portraits of ancestors—neither icons nor the images of Lares and Penates.

The figures in the two pediments of the Parthenon are to be thought of as the outcome of the custom rather than the pattern from which this custom derived. Yet the statuettes seem much later in date than the grand statues of the Parthenon. Doubtless works of the highest style, made during the great epochs and now utterly gone, live again in such humble forms, because the clay-bakers imitated or adapted them freely for common use.

Yet it must be remembered that long before the Parthenon was decorated the fashion of filling pediments of temple and tomb with statuary of some sort and some degree of excellence was in existence; not, of course, with pieces as exquisite as the terra cottas: these had the benefit of their example.

If we consider, then, the cheapness of these wares and the multitude of uses to which they could be put, we may be able to understand why great masses of them are found in one

jecting arms that most breaks are found. The predominance of the shallow triangle as the outline of the place where many of the groups were to stand — namely, the different pediments of tomb and sarcophagus — may account for the continuance in a large number of groups of a more or less pyramidal outline, which has already been traced ultimately to the temple pediment. Working with this common destination of his group in view, the modeler of puppets who rose to the level needed to fashion

BEGINNING THE BACCHIC DANCE.

grave or in one tomb or thrown together into an urn, and also why they are usually discovered fractured, sometimes into bits. Always fragile, they must have been often broken by chance or malice when affixed to the exterior of tombs, and hardly less often when the tomb was entered for good or evil purpose by friend or thief. Hence those who had the cemetery in charge would be constantly collecting broken statuettes and throwing them into an empty tomb or pit or urn. The heads, being usually solid, and made originally separate from the body or groups, became easily detached and yet were least fragile; they are found in countless numbers. The group statuettes are thinnest where the clay was thinnest when pushed into the mold; namely, between the figures. It is there and across pro-

jecting arms that most breaks are found. The predominance of the shallow triangle as the outline of the place where many of the groups were to stand — namely, the different pediments of tomb and sarcophagus — may account for the continuance in a large number of groups of a more or less pyramidal outline, which has already been traced ultimately to the temple pediment. Working with this common destination of his group in view, the modeler of puppets who rose to the level needed to fashion

the finer sort would naturally slope the figures somewhat from the center towards the sides. In estimating the age of terra cottas, taken from what part of Greece or Asia Minor cannot be discovered, one is thrown back on the internal evidence of style. But that is a weak reed, too, for among the people a style may persist for ages after the great artists cease to practice it. The nymph kneeling beside a two-handled wine-jar, with a garland in the right hand and ivy-leaves in her hair, suggests an age when nobler ideals existed among the artists of Greece than later, when Philip of Macedon changed the situation at home completely and Alexander the Great widened the borders of Greece to India. Yet taking them all in all they seem to belong to the age after Alexander the Great.

THE BOYHOOD OF BACCHUS.

From the art side, however, it is a minor consideration where, when, and by whom such things were fashioned, though useful beyond measure to those who seek by the aid of history and ethnology to explain the fine arts and thus show the way for humanity to reach again the plane of the Greeks. The great world of artists and lovers of art is far more interested in the intrinsic loveliness of the articles. Take, for instance, such a group as this, of five young people beginning to dance. The artist has not merely indicated draperies with charming ease, or disposed of the limbs with grace, or kept a reminiscence of the pyramidal outline of the whole; he has given each head a character and gesture of its own absolutely in keeping with the action of the figure. For each figure is at a different point of movement. The young girl on the left has begun the slow dance, perhaps to Bacchus, perhaps to Apollo. She has thumped her tambourine and lowered it, while from the swing of her skirt we see that she is dancing in earnest with lowered hands. The maiden next to her, crowned, to make her head vary from the others, has also begun, but her movement is not yet great, as she holds up her tambourine and keeps the time. The smiling youth has begun too, and with a gesture of the left hand seems to say archly, "Behold, I am off!" The serious young fellow

next him turns to catch the time and raises his right foot—he too is moving. Finally, the smiling girl on the extreme right waits a moment before she falls into step and the whole five are in motion. The wave of dance, a slow, beautiful, seemly dance, which undulates through this little cheap statuette, is one of the most exquisite things in ancient art.

Movement less subtle, but a composition beyond praise, is the group of one animal and three human figures, an ivy-crowned Bacchante with shallow goblet and wine-jug raised high in air, walking in a teasing way before a she-goat on which a child Bacchus balances himself. The youthful god has a large two-handled wine-jar on the back of his shaggy steed and laughs to see the eagerness of the beast when tempted with wine by the nymph. The rear is brought up by a satyr with human extremities, heavy beard, and flat, broad features. The period chosen is the bringing up of Dionysus by the nymphs of Nysa, a place in the classic land whence these terra cottas are said to hail. The pyramidal shape is not present, as if it were the square lower end of a sarcophagus, or a square niche in house or tomb for which the group was intended. The grace of Dionysus, the turn of the nymph's head and body, the swing of her draperies, the eager, natural appearance of the goat as she lifts her

muzzle and opens her lips in a bleat, are points which no one will fail to admire. The satyr carries in his left hand some object, possibly a symbol of nature-worship; with his right he steadies his young charge on the goat.

Shelley's translation of the hymn to Mercury is the proper commentary to the fifth statuette, which, like three others, belongs to MM. Rollin

of the kneeling figure makes one think of Mercury rather than Apollo. But why should he be kneeling in the attitude of one who peers under the cow at the child hidden away in the shadow?

The cow and calf in this group, the lion in another, the bull carrying off Europa in a third, make one change opinion regarding the power

APOLLO DISCOVERING IN THE BABY MERCURY THE STEALER OF HIS COWS.

et Feuadent of Paris. Apollo, having charge of the famous kine of Admetus, has tracked them to Mount Cyllene in Arcadia, and to his amazement discovered that they were stolen by his baby half-brother, the infant son of Maia. In order to bring in the cows the sculptor has made Mercury hide himself among them, instead of in the cradle, as the hymn has it. Apollo gazes astounded at the spectacle of a thief less than a year old, and demands his herds. Hermes answers:

An ox-stealer should be both tall and strong,
And I am but a little new-born thing,
Who yet at least can think of nothing wrong.

In this group it is open to argument whether the title should not be "Mercury bringing the baby Bacchus to Ino to save him from the wrath of Juno." Certainly the hat slung over the back

of the Greeks to treat animals in sculpture. They are worthy to rank with Antoine Louis Barye's statuettes of animals in the present century. That wide chasm between the greatest sculpture the world has ever known and rude reliefs for tombs has now been partly filled. We can see by these groups, and the charming little single figures from tombs near Tanagra and Bœotia and Tarsus in Asia Minor, that there was a reason for such wonderful sculpture as Greece showed. Sculpture of great beauty existed in the homes of the people and surrounded them in their graves.

These terra cottas are object lessons in art which we cannot afford to be without. Whether by purchase from dealers, or by the way of excavations conducted through the American School at Athens, they should be acquired for the art students of the United States.

Charles de Kay.

ABRAHAM LINCOLN: A HISTORY.¹

THE CAPTURE OF JEFFERSON DAVIS—THE END OF REBELLION—LINCOLN'S FAME.

BY JOHN G. NICOLAY AND JOHN HAY, PRIVATE SECRETARIES TO THE PRESIDENT.

THE CAPTURE OF JEFFERSON DAVIS.

WHEN Jefferson Davis and the remnant of the Confederate Cabinet, with the most important and portable portion of their department archives, left Richmond on the night of April 2, in consequence

of Lee's retreat, they proceeded to Danville, southwest of Richmond, arriving there the following morning. In a conference between Davis and Lee, in which the probability of abandoning Richmond was discussed, they had agreed upon this point at which to endeavor to unite the armies of Lee and Johnston, first to attack and beat Sherman and then return and defeat Grant. We have related how Grant, so far from permitting Lee to execute the proposed junction, did not even allow him to reach Danville. Lee had been pressed so hard that he had not found opportunity to inform Davis where he was going, and this absence of news probably served to give Davis an intimation that their preconceived plans were not likely to reach fulfillment. Nevertheless, the rebel President made a show of confidence; rooms were obtained, and, he says, the "different departments resumed their routine labors," though it may be doubted whether in these labors they earned the compensation which the Confederate States promised them.

Two days after his arrival at Danville, Jefferson Davis added one more to his many rhetorical efforts to "fire the Southern heart." On the 5th he issued a proclamation, in which, after reciting the late disasters in as hopeful a strain as possible, he broke again into his never-failing grandiloquence:

We have now entered upon a new phase of the struggle. Relieved from the necessity of guarding particular points, our army will be free to move from point to point, to strike the enemy in detail far from his base. Let us but will it and we are free.

Animated by that confidence in your spirit and fortitude which never yet failed me, I announce to you, fellow-countrymen, that it is my purpose to

maintain your cause with my whole heart and soul; that I will never consent to abandon to the enemy one foot of the soil of any of the States of the Confederacy; that Virginia—noble State, whose ancient renown has been eclipsed by her still more glorious recent history; whose bosom has been bared to receive the main shock of this war; whose sons and daughters have exhibited heroism so sublime as to render her illustrious in all time to come—that Virginia, with the help of the people and by the blessing of Providence, shall be held and defended, and no peace ever be made with the infamous invaders of her territory.

If, by the stress of numbers, we shall be compelled to a temporary withdrawal from her limits or those of any other border State, we will return until the baffled and exhausted enemy shall abandon in despair his endless and impossible task of making slaves of a people resolved to be free.²

In his book, written many years after, Davis is frank enough to admit that this language in the light of subsequent events may fairly be said to have been oversanguine. He probably very soon reached this conviction, for almost before the ink was dry on his proclamation, a son of Governor Wise, escaping through the Federal lines on a swift horse, brought him information of the surrender of Lee's army to Grant. Rumor also reaching him that the Federal cavalry was pushing southward west of Danville, the Confederate Government again hastily packed its archives into a railroad train and moved to Greensboro', North Carolina. Its reception at this place was cold and foreboding. The headquarters of the Government remained on the train at the depot. Only Jefferson Davis and Secretary Trenholm, who was ill, were provided with lodgings. From this point Davis sent a despatch to General Johnston, soliciting a conference, either at Greensboro' or at the general's headquarters; and in response to this request Johnston came without delay to Greensboro', arriving there on the morning of April 12. Within an hour or two both Generals Johnston and Beauregard were summoned to meet the Confederate President in a council of war,

² Davis, proclamation; "Rise and Fall of the Confederate Government," Vol. II., p. 677.

¹ Copyright by J. G. Nicolay and John Hay, 1886. All rights reserved.

there being also present the members of the rebel Cabinet, namely: Benjamin, Secretary of State; Mallory, Secretary of the Navy, and Reagan, Postmaster-General. The meeting was held in a room some twelve by sixteen feet in size, on the second floor of a small dwelling, and contained a bed, a few chairs, and a table with writing-materials.¹

The infatuation under which Davis had plunged his section into rebellion against the Government, pitting the South with its disparity of numbers² and resources against the North, still beset him in the hour of her collapse and the agony of her surrender. He had figured out how the united armies of Lee and Johnston could successively demolish Sherman and Grant, but he could not grasp the logic of common sense that by the same rule the united armies of Grant and Sherman would make short work of the army of Johnston alone whenever they could reach it. The spirit of obstinate confidence with which he entered upon the interview may be best inferred from the description of it written by the two principal actors themselves. Davis says:

I did not think we should despair. We still had effective armies in the field, and a vast extent of rich and productive territory both east and west of the Mississippi, whose citizens had evinced no disposition to surrender. Ample supplies had been collected in the railroad depots, and much still remained to be placed at our disposal when needed by the army in North Carolina. . . . My motive, therefore, in holding an interview with the senior generals of the army in North Carolina was not to learn their opinion as to what might be done by negotiation with the United States Government, but to derive from them information in regard to the army under their command, and what it was feasible and advisable to do as a military problem.³

Johnston's statement shows still more distinctly how impossible it was for Davis to lay aside the airs of dictator:

We had supposed we were to be questioned concerning the military resources of our department, in connection with the question of continuing or terminating the war. But the President's object seemed to be to give, not to obtain, information; for, addressing the party, he said that in two or three weeks he would have a large army in the field by bringing back into the ranks those who had abandoned them in less desperate circumstances, and by calling out the enrolled men whom the conscript bureau with its forces had been unable to bring into the army. . . . Neither opinions nor information was asked, and the conference terminated.⁴

Pollard, the Southern historian, is probably not far wrong in saying that this

was an interview of inevitable embarrassment and pain. The two generals [Johnston and Beauregard] were those who had experienced most of the prejudice and injustice of the President; he had always felt aversion for them, and it would have been an almost impossible excess of Christian magnanimity if they had not returned something of resentment and coldness to the man who, they believed, had arrogantly domineered over them and more than once sought their ruin.⁵

Now when Davis, without even the preface of asking their opinions, bade these two men resuscitate his military and political power and transform him from a fugitive to a commander-in-chief, it is not to be wondered at that the interview terminated without result.

Matters were thus left in an awkward situation for all parties: the rebel chief had no promise of confidence or support; the generals no authority to negotiate or surrender; the Cabinet no excuse to intervene by advice or protest to either party. This condition was, however, opportunely relieved by the arrival during the afternoon of the Secretary of War, Breckinridge, who was the first to bring them the official and undoubted intelligence of the surrender of Lee with his whole army, of which they had hitherto been informed only by rumor, and which they had of course hoped to the last moment might prove unfounded. The fresh news naturally opened up another discussion and review of the emergency between the various individuals, and seems at length to have brought them to a frank avowal of their real feelings to each other in private. Johnston and Beauregard, holding military counsel together, "agreed in the opinion that the Southern Confederacy was overthrown."⁶ This opinion Johnston also repeated to Breckinridge and Mallory, both of whom, it would seem, entertained the same view. The absence of anything like full confidence and cordial intimacy between Davis and his advisers is shown by the fact that these two members of his Cabinet were unwilling to tell their chief the truth which both recognized, and urged upon General Johnston the duty of making the unwelcome suggestion "that negotiations to end the war should be commenced." Breckinridge promised to bring about an opportunity; and it was evidently upon his suggestion that Davis called together a second conference of his Cabinet and his generals.⁷ There is a conflict of statement as to when it

took place. Both Davis and Mallory in their accounts group together all the incidents as if they occurred at a single meeting, which Mallory places on the evening of the 12th, while Johnston's account mentions the two separate meetings, the first on the morning of the 12th, and the second on the morning of the 13th; there being, however, substantial agreement between all as to the points discussed.

Of this occasion, so full of historical interest, we fortunately have the records of two of the participants. General Johnston writes:

Being desired by the President to do it, we compared the military forces of the two parties to the war. Ours, an army of about 20,000 infantry and artillery, and 5000 mounted troops; those of the United States, three armies that could be combined against ours, which was insignificant compared with either Grant's of 180,000 men, Sherman's of 110,000 at least, and Canby's of 60,000—odds of 17 or 18 to 1, which in a few weeks could be more than doubled. I represented that under such circumstances it would be the greatest of human crimes for us to attempt to continue the war; for, having neither money nor credit, nor arms but those in the hands of our soldiers, nor ammunition but that in their cartridge-boxes, nor shops for repairing arms or fixing ammunition, the effect of our keeping the field would be, not to harm the enemy, but to complete the devastation of our country and ruin of its people. I therefore urged that the President should exercise at once the only function of government still in his possession, and open negotiations for peace. The members of the Cabinet present were then desired by the President to express their opinions on the important question. General Breckinridge, Mr. Mallory, and Mr. Reagan thought that the war was decided against us, and that it was absolutely necessary to make peace. Mr. Benjamin expressed the contrary opinion. The latter made a speech for war much like that of Sempronius in Addison's play.¹

Secretary Mallory's account is even more full of realistic vividness. He represents Davis, after introducing the dreaded topic by several irrelevant subjects of conversation, and coming finally to "the situation of the country," as saying:

"Of course we all feel the magnitude of the moment. Our late disasters are terrible, but I do not think we should regard them as fatal. I think we can whip the enemy yet, if our people will turn out. We must look at matters calmly, however, and see what is left for us to do. Whatever can be done must be done at once. We have not a day to lose." A pause ensued, General Johnston not seeming to deem himself expected to speak, when the President said, "We should like to hear your views, General Johnston." Upon this the general, without preface or introduction,—his words translating the expression which his face had worn since he entered

the room,—said, in his terse, concise, demonstrative way, as if seeking to condense thoughts that were crowding for utterance: "My views are, sir, that our people are tired of the war, feel themselves whipped, and will not fight. Our country is overrun, its military resources greatly diminished, while the enemy's military power and resources were never greater, and may be increased to any desired extent. We cannot place another large army in the field; and cut off as we are from foreign intercourse, I do not see how we could maintain it in fighting condition if we had it. My men are daily deserting in large numbers, and are taking my artillery teams to aid their escape to their homes. Since Lee's defeat they regard the war as at an end. If I march out of North Carolina, her people will leave my ranks. It will be the same as I proceed south through South Carolina and Georgia, and I shall expect to retain no man beyond the by-road or cow-path that leads to his house. My small force is melting away like snow before the sun, and I am hopeless of recruiting it. We may perhaps obtain terms which we ought to accept." The tone and manner, almost spiteful, in which the general jerked out these brief, decisive sentences, pausing at every paragraph, left no doubt as to his own convictions. When he ceased speaking, whatever was thought of his statements—and their importance was fully understood—they elicited neither comment nor inquiry. The President, who during their delivery had sat with his eyes fixed upon a scrap of paper which he was folding and refolding abstractedly, and who had listened without a change of position or expression, broke the silence by saying, in a low, even tone, "What do you say, General Beauregard?" "I concur in all General Johnston has said," he replied. Another silence, more eloquent of the full appreciation of the condition of the country than words could have been, succeeded, during which the President's manner was unchanged.²

Davis's optimism had taken an obstinate form, and even after these irrefutable arguments and stern decisions he remained unconvinced. He writes that he "never expected a Confederate army to surrender while it was able either to fight or to retreat";³ but sustained only by the sophomoric eloquence of Mr. Benjamin, he had no alternative. He inquired of Johnston how terms were to be obtained; to which the latter answered, by negotiation between military commanders, proposing that he should be allowed to open such negotiations with Sherman. To this Davis consented, and upon Johnston's suggestion Secretary Mallory took up a pen and at Davis's dictation wrote down the letter to Sherman⁴ which we have quoted elsewhere, and the results of which have been related. The council of war over, General Johnston returned to his army to begin negotiations with Sherman. On the following day, April 14, Davis and his party, without waiting to

hear the result, left Greensboro' to continue their journey southward.¹

The dignity and resources of the Confederate Government were rapidly shrinking; railroad travel had ceased on account of burned bridges, and it could no longer even maintain the state enjoyed in its car at Greensboro'. We are not informed what became of the archives; its personnel—President, Cabinet, and sundry staff officers—scraped together a lot of miscellaneous transportation, composed of riding horses, ambulances, and other vehicles, which, over roads rendered almost impassable by mud, made their progress to the last degree vexatious and toilsome. The country was so full of fugitives that horse-stealing seems to have become for the time an admitted custom and privilege. We have the statement of Davis's private secretary that eight or ten young Mississippians, one of them an officer, who volunteered to become the rebel President's bodyguard, equipped themselves by "pressing" the horses of neighboring farmers, rendering necessary a premature and somewhat sudden departure in advance of the official party.² Obtaining shelter by night when they could, and camping at other times, the distinguished fugitives made their way to Charlotte, North Carolina, where they arrived on the 18th of April. Since the Confederate Government had considerable establishments at Charlotte, orders were despatched to the quartermaster to prepare accommodations; and this request was reasonably satisfied for all the members of the party except its chief. The quartermaster met them near the town and

explained that, though quarters could be furnished for the rest of us, he had as yet been able to find only one person willing to receive Mr. Davis, saying the people generally were afraid that whoever entertained him would have his house burned by the enemy; that, indeed, it was understood threats to that effect had been made everywhere by Stoneman's cavalry. There seemed to be nothing to do but to go to the one domicile offered. It was on the main street of the town, and was occupied by Mr. Bates, a man said to be of Northern birth, a bachelor of convivial habits, the local agent of the Southern Express Company, apparently living alone with his negro servants, and keeping a sort of "open house," where a broad, well-equipped sideboard was the most conspicuous feature of the situation—not at all a seemly place for Mr. Davis.³

Mr. Davis was perforce obliged to accept this entertainment; and whether he failed to realize the significance of such treatment or whether he was moved by his suppressed in-

dignation to a defiant self-assertion, when a detachment of rebel cavalry passing along the street saluted him with cheers and called him out for a speech, after the usual compliments to soldiers, he "expressed his own determination not to despair of the Confederacy, but to remain with the last organized band upholding the flag."⁴ And this feeling he again emphasized during his stay in Charlotte by a remark to his private secretary, "I *cannot* feel like a beaten man."

The stay at Charlotte was prolonged, evidently to wait for news from Johnston's army. No information came till April 23, when Breckinridge, Secretary of War, arrived, bringing the memorandum agreement made by Sherman and Johnston on the 18th.⁵ The memorandum seems to have been discussed at a Cabinet meeting held on the morning of the 24th, and Mr. Davis yielded to the advice they all gave him to accept and ratify the agreement. He wrote a letter to that effect,⁶ but almost immediately received further information, which Sherman communicated to Johnston, that the Washington authorities had rejected the terms and agreement, and directed Sherman to continue his military operations, and that Sherman had given notice to terminate the armistice. This change, coupled with the news of the assassination of President Lincoln, which the party had received on their arrival in Charlotte, stimulated the hopes of the rebel President, and he sent back instructions to Johnston to disband his infantry and retreat southward with so much of his cavalry and light artillery as he could bring away. Against the daily evidence of his own observation and the steady current of advice from his followers, he was still dreaming of some romantic or miraculous renewal of his chances and fortunes. And in his book, written fifteen years afterward, he makes no attempt to conceal his displeasure that General Johnston refused to obey his desperate and futile orders.

The armistice expired on the 26th, and the fugitive Confederate Government once more took up its southward flight. At starting, the party still made show of holding together. There were the President, most of the members of the Cabinet, several staff officers, and fragments of six cavalry brigades, counting about two thousand, which had escaped in small parties from Johnston's surrender. This was enough to form a respectable escort. There was still talk of the expedition turning westward and making its way across the Mississippi to join Kirby Smith and Magruder. But the

meager accounts plainly indicate that Davis's advisers fed his hope for politeness' sake, or to furnish the only pastime with which it was possible to relieve the tedium of their journey; for as they proceeded the expedition melted away as if by enchantment. Davis directed his course towards Abbeville, South Carolina. Mr. Mallory records that though they had met no enemy,

At Abbeville the fragments of disorganized cavalry commands, which had thus far performed, in some respects, an escort's duty, were found to be reduced to a handful of men, anxious only to reach their homes as early as practicable, and whose services could not further be relied on. . . . Almost every cross-road witnessed the separation of comrades in arms, who had long shared the perils and privations of a terrific struggle, now seeking their several homes to resume their duties as peaceful citizens.¹

The members of the Cabinet, except Reagan, also soon dropped off on various pretexts. Benjamin decided to pursue another route, Breckinridge remained behind with the cavalry at the crossing of the Savannah River and never caught up. At Washington, Georgia, a little farther on, Mallory halted "to attend to the needs of his family." Davis waited a whole day at Washington, and finding that neither troops nor leaders appeared, the actual situation seems at last to have dawned upon him. "I spoke to Captain Campbell of Kentucky, commanding my escort," he writes, "explained to him the condition of affairs, and telling him that his company was not strong enough to fight, and too large to pass without observation, asked him to inquire if there were ten men who would volunteer to go with me without question wherever I should choose."² With these, two officers, three members of his personal staff, and Postmaster-General Reagan, he pushed ahead, still nursing his project of crossing the Mississippi River.

Davis's private secretary had been sent ahead to join Mrs. Davis and her family party at Abbeville, South Carolina, and they continued their journey, in advance, with a comfortable wagon train. After passing Washington, in Georgia, rumors of pursuit by Federal cavalry increased, and a more ominous rumor gained circulation that a gang of disbanded Confederates was preparing to plunder the train under the idea that it carried a portion of the official treasure. Apprehension of this latter danger induced the Confederate President to hurry forward and overtake his family, and during three days he traveled in their company. It seems to have been a dismal journey; the roads were bad, heavy storms

were prevailing, signs of danger and prospects of capture were continually increasing, and they were sometimes compelled to start at midnight and push on through driving rain to make good their concealed flight.

They halted about five o'clock in the afternoon of May 9, to camp and rest in the pine woods by a small stream in the neighborhood of Irwinnville, Irwin County, near the middle of southern Georgia. Here the situation was discussed, and it became clear that any hope of reaching the trans-Mississippi country was visionary. The determination was finally arrived at to proceed to the east coast of Florida, and by means of a small sailing vessel, stated to be in readiness, endeavor to gain the Texas coast by sea. It was also agreed that Davis should at once leave his family and push ahead with a few companions. Davis explains that he and his special party did not start ahead at nightfall, as had been arranged, because a rumor reached him that the expected marauding party would probably attack the camp that night, and that he delayed his departure for the protection of the women and children, still intending, however, to start during the night. With this view, his own and other horses remained saddled and ready. But the camp was undisturbed, and fatigue seems to have held its inmates in deep slumber until dawn of May 10, when by a complete surprise a troop of Federal cavalry suddenly captured the whole party and camp. There is naturally some variance in the accounts of the incident, but the differences are in the shades of coloring rather than in the essential facts.

Two expeditions had been sent from Macon by General James H. Wilson in pursuit of Jefferson Davis and his party—the one to scour the left, the other the right bank of the Ocmulgee River; one, under Lieutenant-Colonel Henry Harnden, commanding the 1st Wisconsin Cavalry, starting on the 6th, and the other, under Lieutenant-Colonel B. D. Pritchard, commanding the 4th Michigan Cavalry, starting on the 7th of May. Following different routes, these two officers met at the village of Abbeville, Georgia, in the afternoon of May 9, where they compared notes and decided to continue the pursuit by different roads. As the chase grew hot, smaller detachments from each party spurred on, learned the location of the slumbering camp, and posted themselves in readiness to attack it at daylight, but remained unconscious of each other's proximity.

The fugitives' camp was in the dense pine woods a mile and a half north of Irwinnville. Pritchard had reached this village after midnight, obtained information about the camp, and procured a negro boy to guide him to it.

¹ Alfriend, "Life of Jefferson Davis," p. 630.

² Davis, "Rise and Fall of the Confederate Government," Vol. II., p. 695.

Approaching to within half a mile, he halted, both to wait for daylight and to send his lieutenant, Purinton, with twenty-five dismounted men to gain the rear of the camp, but cautioning him that a part of Harnden's command would in all probability approach from that direction, and that he must avoid a conflict with them. (See also pages 586 and 595.)

At daybreak [writes Captain Lawton of Pritchard's force] the order was passed in a whisper to make ready to enter the camp. The men were alive to the work. Mounting their horses, the column moved at a walk until the tents came in sight, and then, at the word, dashed in. The camp was found pitched on both sides of the road. On the left hand, as we entered, were wagons, horses, tents, and men; on the right were two wall-tents, fronting from the road. All was quiet in the camp. We encountered no guards; if there were any out, they must have been asleep.¹

Just at this instant, however, firing was heard back of the camp, where Purinton had been sent. This created instant confusion, and Pritchard with most of his force rushed forward through the camp to resist a supposed Confederate attack. It turned out that, despite the precautions taken, the detachment of Pritchard's men under Purinton (the 4th Michigan) had met a detachment of Harnden's men (the 1st Wisconsin), and in the darkness they had mistaken and fired on each other, causing two deaths and wounding a number.

The rush of the cavalry and the firing of course aroused the sleepers, and as they emerged from their tents there was a moment of confusion during which only one or two Federal soldiers remained in the camp. One of these had secured Davis's horse,² which had stood saddled since the previous evening, and which a colored servant had just brought to

his tent. Of what ensued, we give Mr. Davis's own account:

I stepped out of my wife's tent and saw some horsemen, whom I immediately recognized as cavalry, deploying around the encampment. I turned back and told my wife these were not the expected marauders, but regular troopers. She implored me to leave her at once. I hesitated, from unwillingness to do so, and lost a few precious moments before yielding to her importunity. My horse and arms were near the road on which I expected to leave, and down which the cavalry approached; it was, therefore, impracticable to reach them. I was compelled to start in the opposite direction. As it was quite dark in the tent, I picked up what was supposed to be my "raglan," a waterproof light overcoat, without sleeves; it was subsequently found to be my wife's, so very like my own as to be mistaken for it; as I started, my wife thoughtfully threw over my head and shoulders a shawl. I had gone perhaps fifteen or twenty yards when a trooper galloped up and ordered me to halt and surrender, to which I gave a defiant answer, and dropping the shawl and raglan from my shoulders advanced towards him; he leveled his carbine at me, but I expected, if he fired, he would miss me, and my intention was in that event to put my hand under his foot, tumble him off on the other side, spring into his saddle and attempt to escape. My wife, who had been watching, when she saw the soldier aim his carbine at me, ran forward and threw her arms around me. Success depended on instantaneous action, and recognizing that the opportunity had been lost I turned back, and, the morning being damp and chilly, passed to a fire beyond the tent.³

Colonel Pritchard relates in his official report:

Upon returning to camp I was accosted by Davis from among the prisoners, who asked if I was the officer in command, and upon my answering him that I was, and asking him whom I was to call him, he replied that I might call him what or whoever I

sharp eyes were upon the singular-looking 'old mother.' Suddenly, Corporal Munger of Company C, and others, at the same instant, discovered that the 'old mother' was wearing very heavy boots for an aged female, and the corporal exclaimed:

"That is not a woman! Don't you see the boots?" and spurring his horse forward and cocking his carbine, compelled the withdrawal of the shawl, and dis-closed Jeff. Davis.

"As if stung by this discovery of his unmanliness, Jeff. struck an attitude, and cried out:

"Is there a man among you? If there is, let me see him!"

"Yes," said the corporal, "I am one; and if you stir, I will blow your brains out!"

"I know my fate," said Davis, "and might as well die here."

"But his wife threw her arms around his neck, and kept herself between him and the threatening corporal."

"No harm, however, was done him, and he was generally kindly spoken to: he was only stripped of his female attire."

"As a man, he was dressed in a complete suit of gray, a light felt hat, and high cavalry boots, with a gray beard of about six weeks' growth covering his face."

¹ G. W. Lawton in "The Atlantic," September, 1865, p. 344.

² Ibid.

³ Davis, "Rise and Fall of the Confederate Government," pp. 701, 702.

It is but just to give the following narrative of Captain G. W. Lawton of the 4th Michigan Cavalry. It was printed in "The Atlantic Monthly" for September, 1865, and the reader may profitably compare it with Jefferson Davis's own narrative which is quoted in the text.

"Andrew Bee, a private of Company L, went to the entrance of Davis's tent, and was met by Mrs. Davis, 'bareheaded and barefoot,' as he describes her, who, putting her hand on his arm, said:

"Please don't go in there till my daughter gets herself dressed."

"Andrew thereupon drew back, and in a few minutes a young lady (Miss Howell) and another person, bent over as with age, wearing a lady's 'waterproof,' gathered at the waist, with a shawl drawn over the head, and carrying a tin pail, appear, and ask to go to 'the run' for water. Mrs. Davis also appears, and says:

"For God's sake, let my old mother go to get some water!"

"No objections being made, they passed out. But

pleased. When I replied to him that I would call him Davis, and after a moment's hesitation he said that was his name, he suddenly drew himself up in true royal dignity and exclaimed, "I suppose that you consider it bravery to charge a train of defenseless women and children, but it is theft, it is vandalism!"¹

That the correctness of the report may not be questioned, we add the corroborating statement of Postmaster-General Reagan, the sole member of the rebel Cabinet remaining with the party:

Colonel Pritchard did not come up for some time after Mr. Davis was made a prisoner. When he rode up there was a crowd, chiefly of Federal soldiers, around Mr. Davis. He was standing, and dressed in the suit he habitually wore. He turned towards Colonel Pritchard and asked, "Who commands these troops?" Colonel Pritchard replied, without hesitation, that he did. Mr. Davis said to him, "You command a set of thieves and robbers. They rob women and children." Colonel Pritchard then said, "Mr. Davis, you should remember that you are a prisoner." And Mr. Davis replied: "I am fully conscious of that. It would be bad enough to be the prisoner of soldiers and gentlemen. I am still lawful game, and would rather be dead than be your prisoner."²

Colonel Pritchard's official report gives the following list of the persons who fell into his hands:

I ascertained that we had captured Jefferson Davis and family (a wife and four children); John H. Reagan, his Postmaster-General; Colonels Harrison and Lubbock, A. D. C. to Davis; Burton N. Harrison, his private secretary; Major Maurin and Captain Moody, Lieutenant Hathaway; Jeff. D. Howell, midshipman in the rebel navy, and twelve private soldiers; Miss Maggie Howell, sister of Mrs. Davis; two waiting maids, one white and one black, and several other servants. We also captured five wagons, three ambulances, about fifteen horses, and from twenty-five to thirty mules. The train was mostly loaded with commissary stores and private baggage of the party.

The details of the return march are unnecessary; there is no allegation that the prisoners were ill treated. They arrived at Macon on May 13, both captors and prisoners having on the way first learned of the offer of a reward of one hundred thousand dollars for Davis's apprehension on the charge of having been an accomplice in the assassination of President Lincoln. In due time Davis was imprisoned in Fort Monroe. These pages do not afford room to narrate his captivity of about

"He said he thought our Government was too magnanimous to hunt women and children that way.

"When Colonel Pritchard told him that he would do the best he could for his comfort, he answered:

"I ask no favors of you."

"To which surly reply the colonel courteously responded by assuring him of kind treatment.

two years, his arraignment at Richmond before the United States Circuit Court for the District of Virginia for the crime of treason, and his liberation on bail, Horace Greeley having volunteered to become his principal bondsman.

On the 3d of December, 1868, a motion was made to quash the indictment on the ground that the penalties and disabilities denounced against and inflicted on him for his alleged offense, by the third section of the fourteenth article of the Constitution of the United States, were a bar to any proceedings upon such indictment. The court, consisting of Chief-Justice Chase and Judge Underwood, considered the motion, and two days later announced that they disagreed in opinion, and certified the question to the Supreme Court of the United States. Though not announced, it was understood that the Chief-Justice held the affirmative and Judge Underwood the negative on the question. Three weeks from that day President Johnson bestowed upon Mr. Davis and those who had been his followers a liberal and fraternal Christmas gift. On the 25th of December, 1868, he issued a proclamation supplementing the various prior proclamations of amnesty, which declared "unconditionally and without reservation, to all and to every person who directly or indirectly participated in the late insurrection or rebellion, a full pardon and amnesty for the offense of treason against the United States, or of adhering to their enemies during the late civil war, with restoration of all rights, privileges, and immunities under the Constitution and the laws which have been made in pursuance thereof." The Government of course took no further action in the suit; and at a subsequent term of the Circuit Court the indictment was dismissed on motion of Mr. Davis's counsel. The ex-President of the Confederate States was thus relieved from all penalties for his rebellion except the disability to hold office imposed by the third section of the XIVth Amendment, which Congress has hitherto refused to remove.

THE END OF REBELLION.

In the early years of the war, after every considerable success of the national arms, the newspapers were in the habit of announcing that "the back of the rebellion was broken." But at last the time came when the phrase was true; after Appomattox, the rebellion fell to pieces all at once. Lee surrendered less than

"Arrangements were forthwith made to return to Macon. . . .

"The members of Davis's staff submitted with a better grace than he to the capture and march, and were generally quite communicative."

¹ Pritchard to Stanton, May 25, 1865.

² J. H. Reagan in "Annals of the War," p. 155.

one-sixth of the Confederates in arms on the 9th of April; the armies that still remained to them, though inconsiderable when compared with the mighty host under the national colors, were yet infinitely larger than any Washington had commanded, and were capable of strenuous resistance and of incalculable mischief. Leading minds on both sides thought the war might be indefinitely prolonged. We have seen that Jefferson Davis, after Richmond fell, issued his swelling manifesto, saying the Confederates had "now entered upon a new phase of the struggle," and that he would "never consent to abandon to the enemy one foot of the soil of any of the States of the Confederacy." General Sherman, so late as the 25th of April, said, "I now apprehend that the rebel armies will disperse; and instead of dealing with six or seven States, we will have to deal with numberless bands of desperadoes." Neither side comprehended fully the intense weariness of war that had taken possession of the South; and peace came more swiftly and completely than any one had ever dared to hope.

The march of Sherman from Atlanta to the sea and his northward progress through the Carolinas had predisposed the great interior region to make an end of strife, a tendency which was greatly promoted by Wilson's energetic and masterly raid. The rough usage received by Taylor and by Forrest at his hands, and the blow their dignity suffered in the capture of their fugitive President, made their surrender more practicable. An officer of Taylor's staff came to Canby's headquarters on the 19th of April to make arrangements for the surrender of all the Confederate forces east of the Mississippi not already paroled by Sherman and by Wilson—embracing some 42,000 men. On the 4th of May the terms were agreed upon and signed at the village of Citronelle in Alabama. General Taylor gives a picturesque incident of his meeting with General Canby. The Union officers invited the Confederates to a luncheon, and while the latter were enjoying a menu to which they had long been unaccustomed, the military band in attendance began playing "Hail, Columbia." Canby—with a courtesy, Taylor says, equal to anything recorded by Froissart—excused himself, and walked to the door; the music ceased for a moment, and then the air of "Dixie" was heard. The Confederates, not to be left in arrears of good-breeding, then demanded the national air, and the flag of the reunited country was toasted by both sides. The terms agreed upon were those accorded by Grant to Lee with slight changes of detail, the United States Government furnishing transportation and subsistence on the way home to the men lately engaged in the effort

to destroy it. The Confederates willingly testify to the cordial generosity with which they were treated. "Public property," says General Taylor, "was turned over and receipted for, and this as orderly and quickly as in time of peace between officers of the same service." At the same time and place the Confederate Commodore Farrand surrendered to Admiral Thatcher all the naval forces of the Confederacy in the neighborhood of Mobile—a dozen vessels and some hundreds of officers.

General Kirby Smith commanded all the insurgent forces west of the Mississippi. On him the desperate hopes of Mr. Davis and his flying Cabinet were fixed, after the successive surrenders of Lee and Johnston had left them no prospect in the east. They imagined they could move westward, gathering up stragglers as they fled, and, crossing the river, could join Smith's forces, and "form an army, which in that portion of the country, abounding in supplies and deficient in rivers and railroads, could have continued the war. . . ." "To this hope," adds Mr. Davis, "I persistently clung." Smith, on the 21st of April, called upon his soldiers to continue the fight.

You possess the means of long resisting invasion. You have hopes of succor from abroad. . . . The great resources of this department, its vast extent, the numbers, the discipline, and the efficiency of the army, will secure to our country terms that a proud people can with honor accept, and may, under the providence of God, be the means of checking the triumph of our enemy and securing the final success of our cause.

The attitude of Smith seemed so threatening that Sheridan was sent from Washington to bring him to reason. But he did not long hold his position of solitary defiance. One more useless skirmish took place near Brazos, and then Smith followed the example of Taylor, and surrendered his entire force, some 18,000, to General Canby on the 26th of May. The same generous terms were accorded him that had been given to Taylor—the Government fed his troops and carried them to their homes.

Meanwhile, General Wilson had been paroling many thousands of prisoners, who wandered in straggling parties within the limits of his command. One hundred and seventy-five thousand men in all were surrendered by the different Confederate commanders, and there were, in addition to these, about ninety-nine thousand prisoners in national custody during the year; one-third of these were exchanged and two-thirds released. This was done as rapidly as possible, by successive orders of the War Department, beginning on the 9th of May and continuing through the summer.

The first object of the Government was to stop the waste of war. Recruiting ceased im-

mediately after Lee's surrender; the purchase of arms and supplies was curtailed, and measures were taken to reduce as promptly as possible the vast military establishment. It had grown during the last few months to portentous dimensions. The impression that a great and final victory was near at hand, the stimulus of the national hope, the prospect of a brief and prosperous campaign, had brought the army up to the magnificent complement of a million men.¹ The reduction of this vast armament, the retrenchment of the enormous expenses incident to it, were immediately undertaken with a method and despatch which were the result of four years' thorough and practical training, and which would have been impossible under any other circumstances. Every chief of bureau was ordered on the 28th of April to proceed at once to the reduction of expenses in his department to a peace footing, and this before Taylor or Smith had surrendered and while Jefferson Davis was still at large. The transportation department gave up the railroads of the South to their owners, mainly in better condition than that in which they had been received. They began without delay to sell the immense accumulation of draught animals; eight million dollars were realized from that source within the year. The other departments also disposed of their surplus stores. The stupendous difference which the close of the war at once caused in the finances of the country may be seen in the fact that the appropriations for the army in the fiscal year succeeding the war were \$33,814,461 as against \$516,240,131 for the preceding year. The army of a million men was brought down, with incredible ease and celerity, to one of twenty-five thousand.

Before the great army melted away into the greater body of the Republic the soldiers enjoyed one final triumph, a march through the capital, undisturbed by death or danger, under the eyes of their highest commanders, military and civilian, and the representatives of the people whose nationality they had saved. The Army of the Potomac and the army of Sherman—such corps of them as were stationed within reach, waiting their discharge—were ordered to pass in review before General Grant and President Johnson, in front of the Executive Mansion, on the 23d and 24th of May. Those who witnessed this solemn yet joyous pageant will never forget it, and will pray that their children may never witness anything like it. For two whole days this formidable host, eight times the number of the entire peace es-

tablishment, marched the long stretch of Pennsylvania Avenue, starting from the shadow of the dome of the Capitol, and filling that wide thoroughfare to Georgetown with their serried mass, moving with the easy, yet rapid pace of veterans in cadence step. On a platform in front of the White House stood the President and all the first officers of the state, the judges of the highest court, the most eminent generals and admirals of the army and the navy. The weather, on both days, was the finest a Washington May could afford; the trees of Lafayette Square were leafing out in their strong and delicate verdure.

The Army of the Potomac, which for four years had been the living bulwark of the capital, was rightly given the precedence. Meade himself rode at the head of his column, then came the cavalry headed by Merritt—for Sheridan had already started for his new command in the Southwest. Custer, commanding the Third Division, had an opportunity of displaying his splendid horsemanship, as his charger, excited beyond control by the pomp and martial music, bolted near the Treasury, and dashed with the speed of the wind past the reviewing stand, but was soon mastered by the young general, who was greeted with stormy applause as he rode gravely by the second time, covered with garlands of flowers, the gifts of friends on the pavement. The same graceful guerdon was given all the leading commanders; even subalterns and hundreds of private soldiers marched decked with these fragrant offerings. The three infantry corps, the Ninth, under Parke, the Fifth, under Griffin,—though Warren was on the stand, hailed with tumultuous cheers by his soldiers,—and the Second, under Humphreys, moved swiftly forward. Wright, with the Sixth, was too far away to join in the day's parade.² The memory of hundreds of hard-fought battles, of saddening defeats and glorious victories, of the dead and maimed comrades who had fallen forever out of the thinned ranks, was present to every one who saw the veteran divisions marching by under the charge of generals who had served with them in every vicissitude of battle and siege—trained officers like Crook and Ayres, and young and brilliant soldiers who had risen like rockets from among the volunteers, such as Barlow and Miles. Every brigade had its days of immortal prowess to boast, every tattered guidon had its history.

On the 24th Sherman's army marched in review. The general rode in person at the head of his troops, and was received by the dense multitude that thronged the avenue with a tumult of rapturous plaudits, which might have assured him of the peculiar place he was

¹ May 1, 1865, the aggregate was 1,000,516. [Johnson, Message, Dec. 4, 1865. Appendix, "Globe," p. 4.]

² His corps was reviewed on the 7th of June.

to hold thereafter in the hearts of his fellow-citizens. His horse and he were loaded with flowers; and his principal commanders were not neglected. Howard had just been appointed chief of the Freedmen's Bureau, and therefore Logan commanded the right wing of the Army of the Tennessee, the place he had hoped for, and, his friends insist, deserved, when McPherson fell; Hazen had succeeded to the Fifteenth Corps, and Frank Blair, a chivalrous and martial figure, rode at the head of the Seventeenth. Slocum led the left wing, — the Army of Georgia, — consisting of the Twentieth Corps under Mower, and the Fourteenth under J. C. Davis. The armies of Meade and Sherman were not exclusively from the East and West respectively; for Sherman had the contingent which Hooker and Howard had brought to Chattanooga from the East; and there were regiments from as far west as Wisconsin and Minnesota in the Army of the Potomac. But Sherman's troops were to all intents and purposes Western men, and they were scanned with keen and hospitable interest by the vast crowd of spectators, who were mainly from the East. There was little to choose between the two armies: a trifle more of neatness and discipline, perhaps, among the veterans of Meade; a slight preponderance in physique and in swinging vigor of march among the Westerners; but the trivial differences were lost in the immense and evident likeness, as of brothers in one family. There was a touch of the grotesque in the march of Sherman's legions which was absent from the well-ordered corps of Meade. A small squad of bummers followed each brigade, in their characteristic garb and accessories; small donkeys loaded with queer spoils; goats and game-cocks, regimental pets, sitting gravely on the backs of mules; and pickaninnies, the adopted children of companies, showed their black faces between the ranks, their eyes and teeth gleaming with delight.

As a mere spectacle, this march of the mightiest host the continent had ever seen gathered together was grand and imposing, but it was not as a spectacle alone that it affected the beholder most deeply. It was not a mere holiday parade; it was an army of citizens on their way home after a long and terrible war. Their clothes were worn with toilsome marches and pierced with bullets; their banners had been torn with shot and shell and lashed in the winds of a thousand battles; the very drums and fifes that played the ruffles as each battalion passed the President had called out the troops to numberless night alarms, had sounded the onset at Vicksburg and Antietam, had inspired the wasted valor of Kenesaw and Fredericksburg, had throbbed with the electric pulse of

victory at Chattanooga and Five Forks. The whole country claimed these heroes as a part of themselves, an infinite gratification forever to the national self-love; and the thoughtful diplomatists who looked on the scene from the reviewing stand could not help seeing that there was a conservative force in an intelligent democracy which the world had never before known.

With all the shouting and the laughter and the joy of this unprecedented ceremony there was one sad and dominant thought which could not be driven from the minds of those who saw it — that of the men who were absent, and who had, nevertheless, richly earned the right to be there. The soldiers, in their shrunken companies, were conscious of the ever-present memories of the brave comrades who had fallen by the way; and in the whole army there was the passionate and unavailing regret that their wise, gentle, and powerful friend, Abraham Lincoln, was gone forever from the house by the avenue, where their loyal votes, supporting their loyal bayonets, had contributed so much to place him.

The world has had many lessons to learn from this great war: the naval fight in Hampton Roads opened a new era in maritime warfare; the marches of Sherman disturbed all previous axioms of logistics; the system of instantaneous intrenchments, adopted by the soldiers of both sides in the latter part of the war, changed the whole character of modern field tactics. But the greatest of all the lessons afforded to humanity by the Titanic struggle in which the American Republic saved its life is the manner in which its armies were levied, and, when the occasion for their employment was over, were dismissed. Though there were periods when recruiting was slow and expensive, yet there were others, when some crying necessity for troops was apparent, that showed almost incredible speed and efficiency in the supply of men. Mr. Stanton, in his report for 1865, says:

After the disaster on the Peninsula, in 1862, over 80,000 troops were enlisted, organized, armed, equipped, and sent to the field in less than a month. Sixty thousand troops have repeatedly gone to the field within four weeks; and 90,000 infantry were once sent to the armies from the five States of Ohio, Indiana, Illinois, Iowa, and Wisconsin within twenty days.

This certainly shows a wealth of resources nothing less than imperial, and a power of commanding the physical and moral forces of the nation which has rarely been paralleled. Even more important, by way of instruction and example, was the lesson given the nations by the quick and noiseless dispersion of the enormous host when the war was done. The best friends of the Republic in Europe feared for it in this crisis, and those who disbelieved in

the conservative power of democracy' were loud in their prophecies of the trouble which would arise on the attempt to disband the army. A million men, with arms in their hands, flushed with intoxicating victory, led by officers schooled in battle, loved and trusted—were they not ready for any adventure? Was it reasonable to believe that they would consent to disband and go to work again at the bidding of a few men in black coats at Washington? Especially after Lincoln was dead, could the tailor from Tennessee direct these myriads of warriors to lay down their arms and melt away into the everyday life of citizens? In America there was no anxiety on this score among the friends of the Union. Without giving the subject a thought they knew there was no danger. The war had been made to execute the laws and to save the national existence, and when those objects were attained there was no thought among the soldiers, from the general to the humblest file-closer, but to wait for the expected orders from the civil authorities for their disbandment.

The orders came as a mere matter of course, and were executed with a thoroughness and rapidity which then seemed also a matter of course, but which will appear more and more wonderful to succeeding generations. The muster-out began on the 29th of April, before Lincoln was borne to his grave, before Davis was caught, before the rebels of the Trans-Mississippi had ceased uttering their boasts of eternal defiance. First the new recruits, next the veterans whose terms were nearly expired, next those expensive corps the cavalry and artillery, and so on in regular order. Sherman's laurel-crowned army was the first to complete its muster-out, and the heroic Army of the Potomac was not far behind it. These veterans of hundreds of battlefields were soon found mingled in all the pursuits of civic activity. By the 7th of August 641,000 troops had become citizens; by the middle of November over 800,000 had been mustered out—without a fancy in any mind that there was anything else to do.

The Navy Department had not waited for the return of peace to begin the reduction of expenses. As soon as Fort Fisher fell the retrenchment began, and before Grant started on his last campaign considerable progress had been made in that direction. The 1st of May the squadrons were reduced one-half, and in July but thirty steamers comprised the entire blockading squadron on the Atlantic and the Gulf. The Potomac and Mississippi flotillas were wholly discontinued in another month. When Mr. Welles made his annual report in December he could say: "There were in the several blockading squadrons in January last,

exclusive of other duty, 471 vessels and 2445 guns. There are now but 29 vessels remaining on the coast, carrying 210 guns, exclusive of howitzers." Superfluous vessels were sold by hundreds and the money covered into the Treasury; thousands of the officers and sailors who had patriotically left the merchant service to fight under the national flag went back to the pursuits of peace.

For the purposes of pacification and the reëstablishment of the national authority the country was divided into five grand divisions—that of the Atlantic, commanded by Meade; the Mississippi, by Sherman; the Gulf, by Sheridan; the Tennessee, by Thomas; and the Pacific, by Halleck. These again were subdivided into nineteen departments, and we print here the names of the generals commanding them for the last time, as a roll of the men who survived the war, most favored by fortune and their own merits: Hooker, Hancock, Augur, Ord, Stoneman, Palmer (J. M.), Pope, Terry, Schofield, Sickles, Steedman, Foster (J. G.), Wood (T. J.), Wood (C. R.), Canby, Wright, Reynolds, Steele, McDowell. The success or failure of these soldiers in administering the trusts confided to them, their relations to the people among whom they were stationed, and to the President who succeeded to the vacant chair of Lincoln, form no part of the story we have attempted to tell.

On the 13th of June the President proclaimed the insurrection at an end in the State of Tennessee; it was not until the second day of April, 1866, that he proclaimed a state of peace as existing in the rest of the United States, and then he excepted the State of Texas; on the 20th of August, in the same year, he made his final proclamation, announcing the reëstablishment of the national authority in Texas, and thereupon he concluded, "I do further proclaim that the said insurrection is at an end, and that peace, order, tranquillity, and civil authority now exist in and throughout the whole of the United States of America."

LINCOLN'S FAME.

THE death of Lincoln awoke all over the world a quick and deep emotion of grief and admiration. If he had died in the days of doubt and gloom which preceded his reëlection, he would have been sincerely mourned and praised by the friends of the Union, but its enemies would have curtly dismissed him as one of the necessary and misguided victims of sectional hate. They would have used his death to justify their malevolent forebodings, to point the moral of new lectures on the instability of democracies. But as he had fallen in the moment of a stupendous victory, the halo

of a radiant success enveloped his memory and dazzled the eyes even of his most hostile critics. That portion of the press of England and the Continent which had persistently vilified him now joined in the universal chorus of elegiac praise.¹ Cabinets and courts which had been cold or unfriendly sent their messages of condolence. The French government, spurred on by their Liberal opponents, took prompt measures to express their admiration for his character and their horror at his taking-off. In the Senate and the Chamber of Deputies the imperialists and the republicans vied with each other in utterances of grief and of praise; the Emperor and the Empress sent their personal condolences to Mrs. Lincoln. In England there was perhaps a trifle of self-consciousness at the bottom of the official expressions of sympathy. The Foreign Office searched the records for precedents, finding nothing which suited the occasion since the assassination of Henry IV. The sterling English character could not, so gracefully as the courtiers of Napoleon III., bend to praise one who had been treated almost as an enemy for so long. When Sir George Grey opened his dignified and pathetic speech in the House of Commons, by saying that a majority of the people of England sympathized with the North, he was greeted with loud protestations and denials on the part of those who favored the Confederacy. But his references to Lincoln's virtues were cordially received, and when he said that the Queen had written to Mrs. Lincoln with her own hand, "as a widow to a widow," the House broke out in loud cheering. Mr. Disraeli spoke on behalf of the Conservatives with his usual dexterity and with a touch of factitious feeling.

There is [he said] in the character of the victim, and even in the accessories of his last moments, something so homely and innocent, that it takes the question, as it were, out of all the pomp of history and the ceremonial of diplomacy; it touches the heart of nations and appeals to the domestic sentiment of mankind.

In the House of Lords the matter was treated with characteristic reticence. The speech of

¹ One of the finest poems on the occasion of his death was that in which the London "Punch" made its manly recantation of the slanders with which it had pursued him for four years:

Beside this corpse that bears for winding-sheet
The Stars and Stripes he lived to rear anew,
Between the mourners at his head and feet,
Say, scurrile jester, is there room for you?

Yes, he had lived to shame me from my sneer,
To lame my pencil, and confute my pen;
To make me own this hind of princes peer,
This rail-splitter a true-born king of men.

Lord Russell was full of that rugged truthfulness, that unbending integrity of spirit, which appeared at the time to disguise his real friendliness to America, and which was only the natural expression of a mind extraordinarily upright, and English to the verge of caricature. Lord Derby followed him in a speech of curious elegance, the object of which was rather to launch a polished shaft against his opponents than to show honor to the dead President; and the address proposed by the Government was voted. While these reserved and careful public proceedings were going on, the heart of England was expressing its sympathy with the kindred beyond sea by its thousand organs of utterance in the press, the resolutions of municipal bodies, the pulpit, and the platform.

In Germany the same manifestations were seen of official expressions of sympathy from royalty and its ministers, and of heartfelt affection and grief from the people and their representatives. Otto von Bismarck, then at the beginning of his illustrious career, gave utterance to the courteous regrets of the King of Prussia; the eloquent deputy, William Loewe, from his place in the House, made a brief and touching speech.

The man [he said] who accomplished such great deeds from the simple desire conscientiously to perform his duty, the man who never wished to be more nor less than the most faithful servant of his people, will find his own glorious place in the pages of history. In the deepest reverence I bow my head before this modest greatness, and I think it is especially agreeable to the spirit of our own nation, with its deep inner life and admiration of self-sacrificing devotion and effort after the ideal, to pay the tribute of veneration to such greatness, exalted as it is by simplicity and modesty.

Two hundred and fifty members of the Chamber signed an address to the American minister in Berlin, full of the cordial sympathy and admiration felt, not only for the dead President, but for the national cause, by the people of Germany.

You are aware [they said] that Germany has looked with pride and joy on the thousands of her sons who in this struggle have placed themselves so resolutely on the side of law and right. You have seen with what pleasure the victories of the Union have been hailed, and how confident the faith in the final triumph of the great cause and the restoration of the Union in all its greatness has ever been, even in the midst of calamity.

Workingmen's clubs, artisans' unions, sent numberless addresses, not merely expressive of sympathy, but conveying singularly just appreciations of the character and career of Lincoln. His death seemed to have marked a step in the education of the people everywhere.

In fact it was among the common people of the entire civilized world that the most genuine and spontaneous manifestations of sorrow and appreciation were produced, and to this fact we attribute the sudden and solid foundation of Lincoln's fame. It requires years, perhaps centuries, to build the structure of a reputation which rests upon the opinion of those distinguished for learning or intelligence; the progress of opinion from the few to the many is slow and painful. But in the case of Lincoln the many imposed their opinion all at once; he was canonized, as he lay on his bier, by the irresistible decree of countless millions. The greater part of the aristocracy of England thought little of him, but the burst of grief from the English people silenced in an instant every discordant voice. It would have been as imprudent to speak slightly of him in London as it was in New York. Especially among the Dissenters was honor and reverence shown to his name. The humbler people instinctively felt that their order had lost its wisest champion.

Not only among those of Saxon blood was this outburst of emotion seen. In France a national manifestation took place which the government disliked, but did not think it wise to suppress. The students of Paris marched in a body to the American Legation to express their sympathy. A two-cent subscription was started to strike a massive gold medal; the money was soon raised, but the committee was forced to have the work done in Switzerland. A committee of French Liberals brought the medal to the American minister, to be sent to Mrs. Lincoln. "Tell her," said Eugène Pelletan, "the heart of France is in that little box." The inscription had a double sense; while honoring the dead Republican, it struck at the Empire. "Lincoln — the Honest Man; abolished slavery, reestablished the Union; Saved the Republic, without veiling the statue of Liberty." Everywhere on the Continent the same swift apotheosis of the people's hero was seen. An Austrian deputy said to the writer, "Among my people his memory has already assumed superhuman proportions; he has become a myth, a type of ideal democracy." Almost before the earth closed over him he began to be the subject of fable. The Freemasons of Europe generally regard him as one of them — his portrait in Masonic garb is often displayed; yet he was not one of that brotherhood. The Spiritualists claim him as their most illustrious adept, but he was not a Spiritualist; and there is hardly a sect in the Western world, from the Calvinist to the atheist, but affects to believe he was of their opinion.

A collection of the expressions of sympa-

thy and condolence which came to Washington from foreign governments, associations, and public bodies of all sorts was made by the State Department, and afterwards published by order of Congress. It forms a large quarto of a thousand pages, and embraces the utterances of grief and regret from every country under the sun, in almost every language spoken by man.

But admired and venerated as he was in Europe, he was best understood and appreciated at home. It is not to be denied that in his case, as in that of all heroic personages who occupy a great place in history, a certain element of legend mingles with his righteous fame. He was a man, in fact, especially liable to legend. We have been told by farmers in central Illinois that the brown thrush did not sing for a year after he died. He was gentle and merciful, and therefore he seems in a certain class of annals to have passed all his time in soothing misfortune and pardoning crime. He had more than his share of the shrewd native humor, and therefore the loose jest books of two centuries have been ransacked for anecdotes to be attributed to him. He was a great and powerful lover of mankind, especially of those not favored by fortune. One night he had a dream, which he repeated the next morning to the writer of these lines, which quaintly illustrates his unpretending and kindly democracy. He was in some great assembly; the people made a lane to let him pass. "He is a common-looking fellow," some one said. Lincoln in his dream turned to his critic and replied, in his Quaker phrase, "Friend, the Lord prefers common-looking people: that is why he made so many of them." He that abases himself shall be exalted. Because Lincoln kept himself in such constant sympathy with the common people, whom he respected too highly to flatter or mislead, he was rewarded by a reverence and a love hardly ever given to a human being. Among the humble working people of the South whom he had made free this veneration and affection easily passed into the supernatural. At a religious meeting among the negroes of the Sea Islands a young man expressed the wish that he might see Lincoln. A gray-headed negro rebuked the rash aspiration: "No man see Linkum. Linkum walk as Jesus walk — no man see Linkum."¹ But leaving aside these fables, which are a natural enough expression of a popular awe and love, it seems to us no calmer nor more just estimate of Lincoln's relation to his time has ever been made — nor perhaps ever will be — than that uttered by one of the wisest and most Amer-

¹ Mr. Hay had this story from Captain E. W. Hooper immediately after it happened. It has been told with many variations.

ican of thinkers, Ralph Waldo Emerson, a few days after the assassination. We cannot forbear quoting a few words of this remarkable discourse, which shows how Lincoln seemed to the greatest of his contemporaries.

A plain man of the people, an extraordinary fortune attended him. Lord Bacon says, "Manifest virtues procure reputation; occult ones fortune." . . . His occupying the chair of state was a triumph of the good sense of mankind and of the public conscience. . . . He grew according to the need; his mind mastered the problem of the day; and as the problem grew, so did his comprehension of it. Rarely was a man so fitted to the event. . . . It cannot be said that there is any exaggeration of his worth. If ever a man was fairly tested, he was. There was no lack of resistance, nor of slander, nor of ridicule. . . . Then what an occasion was the whirlwind of the war! Here was no place for holiday magistrate, nor fair-weather sailor; the new pilot was hurried to the helm in a tornado. In four years—four years of battle-days—his endurance, his fertility of resources, his magnanimity, were sorely tried and never found wanting. There by his courage, his justice, his even temper, his fertile counsel, his humanity, he stood a heroic figure in the center of a heroic epoch. He is the true history of the American people in his time; the true representative of this continent—father of his country, the pulse of twenty millions throbbing in his heart, the thought of their minds articulated by his tongue.

The quick instinct by which the world recognized him, even at the moment of his death, as one of its greatest men, was not deceived. It has been confirmed by the sober thought of a quarter of a century. The writers of each nation compare him with their first popular hero. The French find points of resemblance in him to Henry IV.; the Dutch liken him to William of Orange; the cruel stroke of murder and treason by which all three perished in the height of their power naturally suggests the comparison, which is strangely justified in both cases, though the two princes were so widely different in character. Lincoln had the wit, the bonhomie, the keen, practical insight into affairs of the Béarnais; and the tyrannous moral sense, the wide comprehension, the heroic patience of the Dutch patriot, whose motto might have served equally well for the American President—*Servis tranquillus in undis*. European historians speak of him in words reserved for the most illustrious names. Merle d'Aubigné says, "The name of Lincoln will remain one of the greatest that history has to inscribe on its annals." Henri Martin predicts nothing less than a universal apotheosis: "This man will stand out in the traditions of his country and the world as an incarnation of the people, and of modern democracy itself."

In this country, where millions still live who were his contemporaries, and thousands who knew him personally, where the envies and jealousies which dog the footsteps of success still linger in the hearts of a few, where journals still exist that loaded his name for four years with daily calumny, and writers of memoirs vainly try to make themselves important by belittling him, his fame has become as universal as the air, as deeply rooted as the hills. The faint discords are not heard in the wide chorus that hails him second to none and equaled by Washington alone. The eulogies of him form a special literature. Preachers, poets, soldiers, and statesmen employ the same phrases of unconditional love and reverence. Men speaking with the authority of fame use unqualified superlatives. Lowell, in an immortal ode, calls him "New birth of our new soil, the first American." General Sherman says, "Of all the men I ever met, he seemed to possess more of the elements of greatness, combined with goodness, than any other." He is spoken of, with scarcely less of enthusiasm, by the more generous and liberal spirits among those who revolted against his election and were vanquished by his power. General Longstreet¹ calls him "the greatest man of rebellion times, the one matchless among forty millions for the peculiar difficulties of the period." An eminent Southern orator,² referring to our mixed Northern and Southern ancestry, says:

From the union of those colonists, from the straightening of their purposes and the crossing of their blood, slow perfecting through a century, came he who stands as the first typical American, the first who comprehended within himself all the strength and gentleness, all the majesty and grace of this republic—Abraham Lincoln.

It is not difficult to perceive the basis of this sudden and world-wide fame, nor rash to predict its indefinite duration. There are two classes of men whose names are more enduring than any monument—the great writers, and the men of great achievement; the founders of states, the conquerors. Lincoln has the singular fortune to belong to both these categories; upon these broad and stable foundations his renown is securely built. Nothing would have more amazed him while he lived than to hear himself called a man of letters; but this age has produced few greater writers. We are only recording here the judgment of his peers. Emerson ranks him with Æsop and Pilpay in his lighter moods, and says:

The weight and penetration of many passages in his letters, messages, and speeches, hidden now by the very closeness of their application to the moment, are destined to a wide fame. What pregnant definitions, what unerring common sense, what foresight, and on great occasions what lofty, and

¹ "Battles and Leaders," Vol. II., p. 405.

² H. W. Grady.

more than national, what human tone! His brief speech at Gettysburg¹ will not easily be surpassed by words on any recorded occasion.²

His style extorted the high praise of French Academicians; Montalembert³ commended it as a model for the imitation of princes. Many of his phrases form part of the common speech of mankind. It is true that in his writings the range of subjects is not great; he is concerned chiefly with the political problems of the time, and the moral considerations involved in them. But the range of treatment is remarkably wide; it runs from the wit, the gay humor, the florid eloquence of his stump speeches to the marvelous sententiousness and brevity of the letter to Greeley and the address at Gettysburg, and the sustained and lofty grandeur of the Second Inaugural.

The more his writings are studied in connection with the important transactions of his age the higher will his reputation stand in the opinion of the lettered class. But the men of study and research are never numerous; and it is principally as a man of action that the world at large will regard him. It is the story of his objective life that will forever touch and hold the heart of mankind. His birthright was privation and ignorance—not peculiar to his family, but the universal environment of his place and time; he burst through those enchainment conditions by the force of native genius and will; vice had no temptation for him; his course was as naturally upward as the skylark's; he won, against all conceivable obstacles, a high place in an exacting profession and an honorable position in public and private

life; he became the foremost representative of a party founded on an uprising of the national conscience against a secular wrong, and thus came to the awful responsibilities of power in a time of terror and gloom. He met them with incomparable strength and virtue. Caring for nothing but the public good, free from envy or jealous fears, he surrounded himself with the leading men of his party, his most formidable rivals in public esteem, and through four years of stupendous difficulties he was head and shoulders above them all in the vital qualities of wisdom, foresight, knowledge of men, and thorough comprehension of measures. Personally opposed, as the radicals claim, by more than half of his own party in Congress, and bitterly denounced and maligned by his open adversaries, he yet bore himself with such extraordinary discretion and skill, that he obtained for the Government all the legislation it required, and so impressed himself upon the national mind that without personal effort or solicitation he became the only possible candidate of his party for reelection, and was chosen by an almost unanimous vote of the Electoral Colleges. His qualities would have rendered his administration illustrious even in time of peace; but when we consider that in addition to the ordinary work of the executive office he was forced to assume the duties of commander-in-chief of the national forces engaged in the most complex and difficult war of modern times, the greatness of spirit as well as the intellectual strength he evinced in that capacity is nothing short of prodigious. After times will wonder, not at the few and unim-

¹ The text of the address, as slightly revised by President Lincoln, is as follows, and is taken from the autographic copy made for the Soldiers' and Sailors' Fair in Baltimore in 1864:

"Fourscore and seven years ago our fathers brought forth on this continent a new nation, conceived in liberty, and dedicated to the proposition that all men are created equal. Now, we are engaged in a great civil war, testing whether that nation, or any nation so conceived and so dedicated, can long endure. We are met on a great battlefield of that war. We have come to dedicate a portion of that field as a final resting-place for those who here gave their lives that that nation might live. It is altogether fitting and proper that we should do this. But, in a larger sense, we cannot dedicate, we cannot consecrate, we cannot hallow this ground. The brave men, living and dead, who struggled here, have consecrated it, far above our poor power to add or detract. The world will little note nor long remember what we say here, but it can never forget what they did here. It is for us, the living, rather to be dedicated here to the unfinished work which they who fought here have thus far so nobly advanced. It is rather for us to be here dedicated to the great task remaining before us; that from these honored dead we take increased devotion to that cause for which they gave the last full measure of devotion; that we here highly resolve that these dead shall not have died in vain; that this nation, under God, shall have a new birth of freedom; and that government of

the people, by the people, for the people, shall not perish from the earth."—EDITOR.

² It has sometimes been said that this speech was not appreciated at the time of its delivery; we therefore add the testimony of another high authority to that of Emerson. On the day after the dedication Edward Everett wrote to the President: "Permit me . . . to express my great admiration of the thoughts expressed by you with such eloquent simplicity and appropriateness at the consecration of the cemetery. I should be glad if I could flatter myself that I came as near to the central idea of the occasion, in two hours, as you did in two minutes." Mr. Lincoln replied: "Your kind note of to-day is received. In our respective parts yesterday, you could not have been excused to make a short address, nor I a long one. I am pleased to know that in your judgment the little I did say was not entirely a failure. Of course I knew that Mr. Everett would not fail; and yet while the whole discourse was eminently satisfactory, and will be of great value, there were passages in it which transcended my expectations. The point made against the theory of the General Government being only an agency, whose principals are the States, was new to me, and, as I think, is one of the best arguments for the national supremacy. The tribute to our noble women for their angel ministering to the suffering soldiers surpasses in its way, as do the subjects of it, whatever has gone before." [Unpublished MS.]

³ "La Victoire du Nord," p. 133.

portant mistakes he may have committed, but at the intuitive knowledge of his business that he displayed. We would not presume to express a personal opinion in this matter. We use the testimony only of the most authoritative names. General W. T. Sherman has repeatedly expressed the admiration and surprise with which he has read Mr. Lincoln's correspondence with his generals, and his opinion of the remarkable correctness of his military views. General W. F. Smith says :

I have long held to the opinion that at the close of the war Mr. Lincoln was the superior of his generals in his comprehension of the effect of strategic movements and the proper method of following up victories to their legitimate conclusions.¹

General J. H. Wilson holds the same opinion; and Colonel Robert N. Scott, in whose lamented death the army lost one of its most vigorous and best-trained intellects, frequently called Mr. Lincoln "the ablest strategist of the war."

To these qualifications of high literary excellence, and easy practical mastery of affairs of transcendent importance, we must add, as an explanation of his immediate and world-wide fame, his possession of certain moral qualities rarely combined, in such high degree, in one individual. His heart was so tender that he would dismount from his horse in a forest to replace in their nest young birds which had fallen by the roadside; he could not sleep at night if he knew that a soldier-boy was under sentence of death; he could not, even at the bidding of duty or policy, refuse the prayer of age or helplessness in distress. Children instinctively loved him; they never found his rugged features ugly; his sympathies were quick and seemingly unlimited. He was absolutely without prejudice of class or condition. Frederick Douglass says he was the only man of distinction he ever met who never reminded him by word or manner of his color; he was as just and generous to the rich and well born as to the poor

and humble — a thing rare among politicians. He was tolerant even of evil: though no man can ever have lived with a loftier scorn of meanness and selfishness, he yet recognized their existence and counted with them. He said one day, with a flash of cynical wisdom worthy of La Rochefoucauld, that honest statesmanship was the employment of individual meannesses for the public good. He never asked perfection of any one; he did not even insist for others upon the high standards he set up for himself. At a time before the word was invented he was the first of opportunists. With the fire of a reformer and a martyr in his heart he yet proceeded by the ways of cautious and practical statecraft. He always worked with things as they were, while never relinquishing the desire and effort to make them better. To a hope which saw the Delectable Mountains of absolute justice and peace in the future, to a faith that God in his own time would give to all men the things convenient to them, he added a charity which embraced in its deep bosom all the good and the bad, all the virtues and the infirmities of men, and a patience like that of nature, which in its vast and fruitful activity knows neither haste nor rest.

A character like this is among the precious heirlooms of the Republic; and by a special good fortune every part of the country has an equal claim and pride in it. Lincoln's blood came from the veins of New England emigrants, of Middle State Quakers, of Virginia planters, of Kentucky pioneers; he himself was one of the men who grew up with the earliest growth of the Great West. Every jewel of his mind or his conduct sheds radiance on each portion of the nation. The marvelous symmetry and balance of his intellect and character may have owed something to this varied environment of his race, and they may fitly typify the variety and solidity of the Republic. It may not be unreasonable to hope that his name and his renown may be forever a bond of union to the country which he loved with an affection so impartial, and served — in life and in death — with such entire devotion.

ABRAHAM LINCOLN.

I.—THE LIFE MASK

AT THE NATIONAL MUSEUM IN WASHINGTON.

AH, countless wonders, brought from every zone,
Not all your wealth could turn the heart away
From that one semblance of our common clay,
The brow whereon the precious life long flown,
Leaving a homely glory all its own,
Seems still to linger, with a mournful play
Of light and shadow! — His, who held a sway
And power of magic to himself unknown,
Through what is granted but God's chosen few,
Earth's crownless, yet anointed kings,— a soul
Divinely simple and sublimely true
In that unconscious greatness that shall bless
This petty world while stars their courses roll,
Whose finest flower is *self-forgetfulness*.

Stuart Sterne.

II.—THE CENOTAPH.¹

AND so they buried Lincoln? Strange and vain!
Has any creature thought of Lincoln hid
In any vault, 'neath any coffin-lid,
In all the years since that wild Spring of pain?
'T is false,— he never in the grave hath lain.
You could not bury him although you slid
Upon his clay the Cheops pyramid
Or heaped it with the Rocky Mountain chain.
They slew themselves; they but set Lincoln free.
In all the earth his great heart beats as strong,
Shall beat while pulses throb to chivalry
And burn with hate of tyranny and wrong.
Whoever will may find him, anywhere
Save in the tomb. Not there,— he is not there!

James T. McKay.

HOW SAL CAME THROUGH.

BY THE AUTHOR OF "TWO RUNAWAYS," ETC.

THE summer sun balanced itself so evenly over Holly Bluff plantation that the broad white dwelling cast no shadow. But there was shade for all that, great stretches of it where, between the road that curved around the house and the fields now wreathed in tranquil cotton bloom, the pines had been left to check the western winds; and along the edge of the ravine too, where stood the cabins, were cool Rembrandt shadows, into which the open doorways looked out pleasantly, the colors of sundry and varied garments strung along the lines that linked the spreading oaks lending cheerfulness to the scene.

And there was a deep, cool shade in the broad back porch overlooking the blooming field, whose thousand acres ran off under the

¹ On April 14, 1887, the twenty-second anniversary of Lincoln's assassination, press despatches from Springfield reported his final burial in the monumental tomb.

tremulous heat to the varied green of the creek bottom, beyond which the bold ridge with its one hue rose abruptly and checked the vision.

Perhaps it was this fine restful background a mile away, boldly defying the swamp on the right but extending like a miniature mountain range in lessening knobs on the left, that made the back porch old Colonel Tom Broome's favorite spot; perhaps the fact that it overlooked

ON THE PORCH.

the whole plantation and the broad back yard had more to do with it. Anyway he had sat there for forty or fifty years, when he had time to sit, and there his black hair had grown thin and gray, his dark smooth face wrinkled, and his erect form somewhat bent. And here he sat this day nodding in the noon, his pipe fallen to the floor, his glasses slipping from his nose. The erect and defiant rooster came up the steps deliberately, surveyed him with scorn, and began to pick about him with a great show of discovery, calling to his more cautious family, which waited silently at the foot of the steps. The colonel's heavy walking-stick slipped from his side and fell to the floor; the scornful rooster sprang ten feet into the air from the porch, and as he came down excitedly related to the startled family his hairbreadth escape from an imminent deadly trap set for him. Awakened by the disturbance, the old gentleman straightened up in his chair and would probably have soon drifted again into the familiar currents that lead down to repose, but at that moment a young girl stood beside him.

"Grandpa," she said, "here's your julep." She bore a large goblet, from which and from the ruby lake it held rose a little forest of mint.

"I know it is cool, for I drew the water from the north side of the well myself." Her blue eyes smiled upon him as she stood waiting.

The colonel gave her smile for smile as he took the glass. His own eyes were blue, and they softened the fine, stern face wonderfully. He lifted the julep gallantly with mock formality, saying, "Your health, young lady!" As he sipped and drank, the girl laughed softly and recovered his pipe, which she proceeded to fill again, he watching her the while. Her dress was a simple one of some soft white material, with a bit of blue ribbon at the throat, and a bit to hold her sunny hair back from her face. The experience of the moment was an everyday one with them; the girl knew that presently he would blow the dinner horn, smoke his pipe, go in to dinner, return to the chair, smoke and nod again, and finally make his way to the cool East India lounge in the hall, where she would sit fanning him while she read or dreamed the fair sweet dreams of girlhood. This was the midday programme.

To-day she saved him the exertion of rising, by standing on tiptoe, and fishing the carved horn off its hook with the long stem of his pipe. He fixed his eyes upon the far ridge, fitted the mouthpiece to his thin lips, breathed into the instrument, and the mellow call leaped forth across the brooding field. As it soared above them, "Too-oo-oo-oot-oot-oot-oot-oo-oo-oo-oot-oot-oot-oot-oo-oot," the distant negroes let fall their hoe handles, and the plow mules halted abruptly in their tracks. The great ridge gave back mellow echoes, and down the creek bottom into the far swamp a merry hundred fading calls hurried out of hearing. And as silence swallowed them all, July, the aged hound, came out from under the kitchen and stood for a moment gazing thoughtfully with his dim wistful eyes into his master's face, then turned again to seek the cool earth bed. So had he come for years; so would he continue to come as long as his stiffening limbs could bear him, stirred by faint memories and fainter hopes.

As the girl tossed the horn back to its peg the colonel said:

"Now, sweetheart, what's that about your drawing water?"

She smiled into his face again.

"I said I drew it from the north side of the well. You know there is always a lizard that stays on that side and keeps it cool there."

"So I have heard," he replied with gravity. "Let me see those hands." She held out one tiny palm reddened by its exercise with the rope, and he took it in both of his, examining it closely.

"Why did n't you make Sal draw it? You must n't spoil this little hand with such work."

"Well, Grandpa, Sal is out of humor these days, and it is more trouble to make her do anything than to do it for her. I don't think she is quite well," she added quickly, seeing the slight frown upon her grandfather's brow. At that moment a short, thick-set girl came from the kitchen and started for the house. She had a round black face, the thick African lips, an enormous foot, and walked with a peculiar vim that suggested plenty of muscle. Black as was her face naturally, it was darkened by a sullen look that overhung it. The colonel stopped her.

"What 's the matter with you here of late,

dat Sunday, an' dance, an' carry on f'om one day's en' ter 'nother. Ef ever I git my han's on 'er, she goin' ter know who she foolin' wid—"

"Hush!" the colonel spoke sharply.

"Ole Massa, you doan' know dat nigger. She de 'ceivines' huzzy on de place—lie, an' steal—"

"Hush, I tell you! This stuff must end right here. You go now and attend to your work. If I hear anything more of it, I'll send you to the field."

"No, Grandpa, Sal shall not go to the field. She belongs to me, and I want her at the house." The young lady spoke with en-

ergy and emphasis, and Colonel Broome settled back in his chair and proceeded to light his pipe. He was a slave himself sometimes.

"Now, Sal, you come to my room; I want to talk to you." The little lady marched in, and her air was that of an empress. "Sal," she said sternly, when they were alone, "don't you know it is wicked to talk as you do? Suppose you were to die to-day with all that hate in your heart, where do you reckon you would go? Straight down to the—the devil; straight down like—like a bucket falling in the well." Her voice sank into an awful whisper.

"But, Missy, dat nigger—"

"Hush your

mouth! Don't you 'but' me! I say you would go straight down to him, where you ought to go! Are n't you ashamed of yourself, are n't you ashamed! What am I to do with you, I'd like to know? I have read you the Bible, and taught you how to pray, and you get worse and worse every year. Get down on your poor, sinful knees, and ask the Lord to forgive you before he strikes you dead!" Sal dropped down on her knees, and put her face in her hands while her mistress remained standing, lining out the petition to the throne of grace.

"O Lord, look down on me, a miserable

"THE DISTANT NEGROES LET FALL THEIR HOE HANDLES."

Sal?" he asked gravely. "You leave others to do your work. What are you moping about?"

The girl stood silent, picking at her apron. Her young mistress interposed quickly, her womanly instinct half divining the cause.

"Has Alec left you, Sal?"

"Alec been conjured," said Sal, after a long pause.

"By whom?"

All the pent-up wrath came rushing out.

"Dat yellor huzzy, M'ria. She done move ole Miss ter gi' 'er dat frock she promus' me, an' she conjured Alec tell he gone plum crazy 'bout her. Hit's church dis Sunday an' church

sinner!—I am *desperately* wicked!—I am full of hate!—I lie!—I steal!—”

“No, I doan’ steal, Missy!”

“Yes, you do; you stole my ribbon! Say it: ‘I steal!—I ain’t fit to be with decent people!—I ought to be hoeing in the field!—And have forty lashes! O Lord, forgive me—as I forgive my enemies! As I forgive M’ria!’”

“Can’t do dat, Missy!”

“Yes, you can; you *shall*. Say it: ‘As I forgive even M’ria!’”

“Can’t do hit, Missy, can’t do hit; not tell I git my han’s on ’er wunst.”

“But you shall!—‘As I forgive even M’ria!’”

“Lah, Missy, look at de dirt on yo’ new frock!”

“Sal, are you going to mind me, or must I have you sent back to the field?”

“As I fo’give even M’ria,” said Sal, meekly.

“And, O Lord, make me a good girl!—For Christ’s sake!—Amen!” Sal’s conclusion was positively cheerful, and she rose with alacrity.

“Now, Sal,” said Missy, gently, her eyes resting pleadingly on the other’s face, “I want you to promise me that you will go to prayer-meeting Sunday night and try to get religion; won’t you, Sal—for me?” It was an old subject between them. “If you will, I tell you what I’ll do: I’ll get you a better dress than M’ria’s; I will.”

“Sho ’nough, Missy?”

“Sure enough. If you genuinely get religion. I know it is n’t exactly right to hire people to do that; but if you get it, it does n’t make much difference at last. O Sal, I do so want you to be good! Go to prayer-meeting Sunday night and ask the Lord to help you, won’t you, Sal?—just for my sake this time?”

The two girls were about the same age, and foster sisters. The earnestness in Missy’s voice made Sal serious at last.

“I will, Missy,” she said. “I goin’ ter do my bes’, an’ ef you hear me er-singin’ when I come erlong back by heah, hit’s all right. Goin’ ter git me er red frock, Missy?”

The dinner bell rang and the girl darted off with a face full of smiles; or rather with a face full of a smile, for Sal’s smile involved everything in its neighborhood when given full play.

II.

THE road that wound around the pines and into the woodland a quarter of a mile away, where stood the little log plantation church, lay with the tranquil shadows printed darkly upon it by the full moon as Sal plodded along on the following Sunday night. The way was otherwise deserted, for she was the latest comer. As she neared the meeting-house the opening hymn sprang out as if to meet her, and she

paused a moment to listen, for Alec’s rich voice was leading, with the whole congregation swinging into the chorus:

When I wen’ down en de valley ter pray,
Studyin’ ’bout dat good ole way,

(Chorus: Who shell wear de starry crown?
Good Lord, show me de way.)

Ole Satan was deir fer ter hender me,
Layin’ up unner de apple tree:

Who shell wear de starry crown?
Good Lord, show me de way.

He rustle de weeds as I come erlong,
So I lif’ my soul en er holy song:

Who shell wear de starry crown?
Good Lord, show me de way.

He come right out by de side of de road,
An’ ’e says, “Mister man, I’ll tote yo’ load”:

Who shell wear de starry crown?
Good Lord, show me de way.

Says I, “No use fer ter temp’ we men,
De sinner got er better frien’”:

Who shell wear de starry crown?
Good Lord, show me de way.

Er shinin’ ange-ul lit right down
An’ ’e promus’ me dat starry crown—

Oh, I’m goin’ ter wear dat starry crown:
Good Lord, show me de way; Good Lord,
Good Lord, show me de way!

As the refrain died out Sal entered the church and took a seat near the door. Many heads were turned—it takes so little to interest a church audience—and some few worshippers near at hand giggled, for the poor little romance in the girl’s life was known, as all such things on a plantation invariably are. Aunt Tempy whispered to Aunt Chloe that Sal was after M’ria “like er houn’ dog on er rabbit track”; and Aunt Chloe ducked her head down in her lap and shook all over with the violence of her appreciation. But fortunately at that moment Preacher Adkins stood up in the pulpit and said:

“Brer Manuel, will you lead us in de praar?”

There was a sudden commotion on all sides, and the congregation settled down upon its knees, and lifting his face an aged negro began:

“O Lord, look down upon us dis night, an’ doan’ turn yo’ face erway f’om us, fur we come er-’seechin’ de throne o’ grace.”

“Look, King!” responded the stentorian voice of Unc’ Clay from his corner. “Amen!” exclaimed many voices fervently, while Unc’ Peter under the pulpit uttered his low plaintive “Oom-oo-oo-oo-oo” like the tremulous call of a basso-profundo owl in the swamp.

“Lord, let yo’ footsteps come over de moun’tins inter de valley, wher’ yo’ chillun es er-waitin’ an’ er-watchin’ an’ er-callin’ fur yer, en de day-time an’ en de night-time, ye’r en an’ ye’r out!”

“Come down, King!” “Oom-oo-oo-oo-oo.” “Amen! Amen! Amen!”

"Ef hit warn't fur you hit 'u'd be er sorry time down heah; hit 's bad enough anyhow, but hit 'u'd be er heap worse. O Lord! de load 'u'd be hebbier, de sun 'u'd be hotter, de mule 'u'd git bofe legs ober de trace at de en' uv e'ry row, de plow 'u'd fine more stumps, an' our poor sufferin' souls 'u'd be jerked heah an' deir f'om de risin' up uv de sun ter de settin' down uv de same!"

"Yes, King!" "Oom-oo-oo-oo-oo."
"Amen! Amen! Amen!"

"Lord, you know what es en our hearts, you see all de sin down en um; nobody c'n fool *you*, an' you es got yo' pow'ful eye on de sinner de very time he t'inks 'e es hid out bes'. Dey c'n fool ole Massa, dey c'n fool de ober-seer, an' dey wives an' dey husban's, but dey can' fool you. When you tarks dey shakes an' come sneakin' out. But, Lord, hit 's er poor, sorry crowd atter all, an' hit ain't wuff yo' time ter projec' wid 'em. Let yo' mussy fall down an' cover 'em all—de las' one uv 'em; an' let 'em feel hit heah ter-night."

"Do it, King!" "Oom-oo-oo-oo-oo."
"Amen! Amen! Amen!"

"Lord, we don't know how long we got ter stay heah. Some got ter go soon, an' all got ter go atter erwhile. Las' ye'r dug more graves out yonner en de plum orchud dan de ye'r 'fo' lef' deir, an' dis one dug some too. Deir 'll be more deir 'fo' Christmus come. Last week Unc' Siah went; de week 'fo' Aunt Charlotte put two little baby-girls out deir —"

"Mercy, King!" "Oom-oo-oo-oo-oo."
"Amen! Amen! Amen!"

Charlotte's voice in a low chant broke into the prayer and continued to the end in counterpoint. Presently Unc' Manuel's glided into rhythm also, and the whole assembly rocked back and forth, keeping time with their bodies:¹

We all gotter go! An' I *reck'n* hit 'll be ole *Manuel* nex'; fur-somehow-my-legs-ain't-what-dey-*onct*-was; an'-w'en-I-git-down-hit's-mighty-*bard*-ter-git-up—mighty-*bard*-ter-git-up; fur-de-mis'ry-en-de-*ole-man*'s-back; de-ole-man 's-*wearin'*-out; but-es-trust-es-en-de-Lord; an'-e-ain't-nev'r-cail-but-de-Lord-come; mebbe-nex'-time-e-won't-come-but-*sen'*-es-chariot.—

Send hit, King! Oom-oo-oo-oo-oo—

An'-es-snow-white-*robe*-too; sen'-es-snow-white-*robe*-too; an'-de-ole-man-go-'long-an'-*fine*-es-master. Oh, hit 'll-be-er-*great*-day-an'-I-wish-hit-'u'd-come-erlong; an'-I-wish-hit-'u'd-come-erlong. Grant hit, King! Oom-oo-oo-oo-oo. Amen!
Amen! Amen!

(All:) Let-em-git-deir!

"An'," concluded Unc' Manuel, resuming his usual voice, "thine be de kingdom, an' de glory, fr' ever an' de ver, amen." To which all responded heartily.

Preacher Adkins's black face rose up from behind the pulpit and shone out over his enormous cotton collar; but before he could give direction to the services a woman began singing, and the whole congregation joined her, their voices in sweet harmony, leaping out through the dreamy night. One grand soprano and one grand contralto lead all the rest, rising, falling, curving, and sinking to rise again in the moonlit silence. When the sun went down two mated swallows were cruising in the amber haze above the silent field, controlled by a perfect sympathy that linked them together under a single impulse. It was as though these had vanished into voices, and the ear followed their flight when the eye gave them up to shadows:

When I git up ter heaven
My work 'll all be done—
I'm goin' ter wark 'ith Mary
An' her darlin' Son.
I'm er-goin' up home,
I'm er-goin' up home,
I'm er-goin' up home,
Ter er-die no mo'.

I've foun' de load too heavy,
Too heavy ter tote erlone,
I'll lay hit down ter Mary
An' her darlin' Son.
I'm er-goin' up home, etc.

Sinner, de way ter glory
Es de road wher' Jesus run;
Hit 'll carry yer home ter Mary
An' her darlin' Son.
I'm er-goin' up home, etc.

O brudder, doan' git werry,
Yo' work es almos' done;
Meet me at de feet er Mary
An' her darlin' Son.
I'm er-goin' up home, etc.

"Sis' Charlut," said preacher Adkins, as the last tones died away, "will you lead us en de praar?" As the congregation sank to its knees again the slow, plaintive voice of the woman was heard:

"Our Father who art in heaven, I doan' ask yer ter lay as heavy er load on nobody's heart as yer laid on mine. Las' ye'r daddy an'

¹ To imitate this negro, select one tone and keep it monotonously except on the italicized words, which are pitched two notes higher.

mammy; dis ye'r my chillun—all gone, all gone!"—the voice rose in a sudden wail that echoed out in the pines and thrilled the rude hearts about her,—“all gone; laid 'em en de cole groun' an' I 'm lef ter cry over dem—to cry! to cry!”

“Help her, King!” “Oom-oo-oo-oo-oo.” “Amen! Amen! Amen!”

“An' I have cried! But, O my God! I doan' cry 'ginst *you*—oh, no, not 'ginst *you*; fur I know hit 's all right, hit 's all right. But I have cried tell de pillar was wet, tell de cott'n row was wet, tell de bread en my han's was wet, an' I 'm er-cryin' now,”—her wail was almost a shriek,—“I 'm er-cryin' yit—”

“Heah 'er, King!” “Oom-oo-oo-oo-oo.” “Amen! Amen! Amen!”

There was a moment or two of sobbing and mingling of women's voices calling to one another, and then Charlotte's altered, and in a clear, suppliant chant was lifted again; and as she sang, the voices of the other women in a wordless chant ran over hers, making a wild, sweet melody in the church.

“O my dear Saviour, come down ter-night—an' let yo' sof' han'—fine us en de dark—let us see yo' face er-shinin'—let us see yo' blue eyes smilin'—let us heah yo' voice er-callin'—let us heah yo' sof' step comin'—en de lonely night. De sinner knows yo' step,—de sinner knows yo' smile,—de sinner knows yo' voice,—de sinner knows yo' touch;—deir ain' but one friend;—deir ain' but one Saviour; he 's ernough fur me; he 's ernough fur anybody;—he 's ernough fur ev'body;—Lord, we are waitin', look at us! Look at us!—Look at us!—”

“Look, King!” “Oom-oo-oo-oo-oo.” “Amen! Amen! Amen!”

“Er-kneelin' an' er-waitin'—er-watchin' an' er-prayin'; an' heah us!—an' heah us, dear Lord! an' bless us, fur we sho'ly need hit.”

Charlotte's voice had become hoarsened to a whisper and incoherent; finally a general “Amen” was uttered for her.

Up to this time in the prayer-meeting Sal had remained crouching with her face pressed in her hands. The eyes of several were still upon her, and there was considerable whispering among those nearest. Tempy said something to Chloe, but it did not produce a laugh this time. She went over silently to where Sal crouched, and kneeling there talked to her. She tried to pull the girl's hands from her face, but she held them tightly, and as the older woman whispered words of comfort Sal began to cry and moan. Some one had started another hymn: by that subtle influence which connects an audience the struggle in the mind of the young girl was known, and it gave direction

“MEN AND WOMEN STRUGGLED IN EVERY DIRECTION.”

to the services. It was Tempy who lifted her tremulous voice and led the way:

Wonner where Mary an' Marthy es gone,
Wonner where Mary an' Marthy es gone,
Wonner where Mary an' Marthy es gone,
Po' sinner 's foun' er home at las',
Po' sinner 's foun' er home en de new bright worl',
Po' sinner 's foun' er home at las'.

Wonner where Mather an' Mark es gone,
Wonner where Mather an' Mark es gone,
Wonner where Mather an' Mark es gone,
Po' sinner 's foun' er home at las', etc.

Wonner where Luke an' John es gone,
Wonner where Luke an' John es gone,
Wonner where Luke an' John es gone,
Po' sinner 's foun' er home at las', etc.

O sister, es yer goin' ter follow too?
O sister, es yer goin' ter follow too?
O sister, es yer goin' ter follow too?
Po' sinner fin' er home at las', etc.

Several women were kneeling by the side of Sal, and all the congregation sank to their knees as Sal's mother in great excitement began to shout:

“Bless de name er de Lord! Bless de name er de Lord! My chile es comin' through.”

“Bless de King!” Clay's voice rose like a clarion's.

“Oom-oo-oo-oo-oo!” There was a triumphant agony in the response that came from Peter.

“Amen!” was shouted by half a hundred lips.

"SHE PASSED ON AMONG THE PINES."

"Er-comin' through! Hit 's been er long time."

"Yes, sister!"

"Hit 's been er long time! — but hit 's come at las'; his han' done foun' 'er sinful heart, an' hit 's er-leadin' de way."

"Bless the King!" "Oom-oo-oo-oo-oo."
"Amen! Amen! Amen!"

"My chile es er-comin' through, she 's er-comin' erlong de way!" The woman was swaying back and forth and clapping her hands. Her excitement was communicating itself to those around and her speech was growing thick and incomprehensible when suddenly

she fell over, her voice died out, and her limbs stiffened. Two men lifted and carried her out gently, the congregation chanting and scrambling up again. As the little group passed Sal, she sprang to her feet and rushed to the front. She turned first to one and then to another, waving her hands and shouting in the cadence of a quickstep:

Glory! — glory! — glory, glory, glory!
Glory! — glory! — glory, glory, glory!
Glory! — glory! — glory, glory, glory!

Each took her hand, gravely shook it, and released it; and as she moved around, the feet

of all beat time, as though the whole congregation was marching, while through it all ran the wild monotone, "Glory!—glory!—glory, glory, glory!" Occasionally a woman would shout a response and throw her arms around the girl's neck. Presently some began singing again, and all joined in the refrain until the church fairly thundered:

Sister Mary weep, Sister Marthy moan,
Who's on de Lord's side?
De Lord's side es de sho side,
Who's on de Lord's side?
O mo'ners, you on de Lord's side?
O mo'ners, you on de Lord's side?
De Lord's side es de sho side,
Who's on de Lord's side?

And through the weird melody in singular cadence rose the wild cry of the marching girl:

Glory!—glory!—glory, glory, glory!
O sister, lay yo' burden down,
Who's on de Lord's side?
De Lord's side es de sho side,
Who's on de Lord's side? etc.

Sal had made considerable progress on her circuit and was beginning to add a queer little shuffle to her march, popping her long, broad foot upon the resonant plank, when she came face to face with M'ria sitting in all the glory of the Ole Miss frock by the side of Alec. M'ria touched her escort in the side with her elbow and said aloud, grinning:

"Look at Bigfoot Sal!"

It was a fatal remark. Sal was fairly frenzied with excitement, and M'ria drew the whole current. Her rival sprang on her with the fury of a tigress, and in a few moments the Ole Miss frock was reduced to shreds. Sal lifted her light enemy into the air and brought her down to the floor with terrific force, M'ria giving expression to her pain and fear in frightful screams. As Sal tore and bit, the clockwork of her religious fervor ran on: "Glory!—glory!—glory, glory, glory!" she muttered. The congregation had been fired to a white heat by the conversion of the girl, and were just drifting into the ecstatic church dance when the sudden conflict began. M'ria's brother sprang over the benches intervening, and catching Sal by the hair began to cuff her vigorously. The next instant Alec, whose love for his dusky fiancée had only slumbered, jumped on his back like a catamount.

Plantation life is like village life; there are always two sides, and blood is thicker than water. In the excitement of the onset good intentions were mistaken for declarations of war, and when war developed it involved the whole community. Men and women struggled in every direction. Some took flying leaps out of the windows, and some, crawling over the heads of those who packed the doorway, dropped down safely outside, perhaps only to become involved at last, for many old debts are settled in such émeutes.

Gradually the crowd escaped to the exterior of the church and groups were formed on all sides. Fights were still in progress. Presently blows were suspended, and excited discussion took their place. Just at this moment, when a reaction was setting in, and friends were pinning remnants of clothing over the almost nude forms of Tempy and Chloe, while the two loudly abused each other, out of the doorway came Sal. Her head was high in the air, her feet were keeping time to the monotone she was still somewhat exhaustedly shouting:

"Glory!—glory!—glory, glory, glory!"

The crowd gave way, and looking neither to the right nor the left, marching with measured tread, putting in every now and then her queer little shuffle, and slapping the roadway with her long foot, she passed on among the pines, her cotton dress appearing and disappearing at intervals until the distance and shadows swallowed her up. Silence for a moment fell upon the crowd, then a burst of laughter followed: the excitement had taken a more cheerful turn.

On went the girl, and faintly sounded the marching cadence:

"Glory!—glory!—glory, glory, glory!"

Then it died away in the distance, and the crowd found itself interested in two wrecks that crept out of the church and appealed to their sympathies. One was M'ria; the other, Peter.

Slowly, still arguing, the gathering dissolved. But as the scattering groups faded away through the patches of moonlight and shadow, and the night hushed discord, from away up the road where it winds around the house and Missy's darkened bedroom at the corner, there came floating back the words of Sal's triumphant hymn:

"Glory!—glory!—glory, glory, glory!"

H. S. Edwards.

SMILES AND TEARS.

YOU meant to wound me? Then forgive,
O friend, that when the blow fell, I
Turned my face from you to the wall
To smile, instead of die.

VOL. XXXIX.—81.

You meant to gladden me? Dear friend,
Whose praise like jewels I have kept,
Forgive me, that for very joy
I bent my happy head and wept.

A. W. R.

PURSUIT AND CAPTURE OF JEFFERSON DAVIS.

I.—BY THE COMMANDER OF THE UNION CAVALRY.

AFTER the last council of the Confederacy at Abbeville, South Carolina, the practical conclusion of which was that the war was ended, it was made evident that no such force as still remained with Jefferson Davis could get through the country occupied by my troops. The cavalry corps under my command had been distributed throughout Georgia, a large detachment had been sent to Florida, strong parties were now watching every ferry and crossing and patrolling every road, and every officer and man of that splendid force was keenly on the lookout for the fugitives, but up to this time without any exact information of Davis's movements. On the 23d of April I learned that he and his party had been at Charlotte, North Carolina, only three or four days before, and that he was on his way to the South with a wagon-train and an escort of cavalry, but there my information ended for the time. [See also page 561.]

On the 28th, Upton left Macon by rail, accompanied by a part of his division, with orders to leave a detachment under Colonel B. B. Eggleston, 1st Ohio, at Atlanta, and to take another on to Augusta, while Winslow, with the rest of the division, was left to march directly to Atlanta. Before starting, General Alexander, commanding the Second Brigade, at his own suggestion and request was authorized to detach an officer and twenty picked men to be disguised as rebel soldiers, to march northeastward into and through the Carolinas if necessary, for the purpose of obtaining definite information of Davis's movements. This party was placed under the command of Lieutenant Joseph A. O. Yeoman, of the 1st Ohio Cavalry, a brave and enterprising young officer, at that time serving on the staff of Alexander as acting assistant inspector-general of brigade. He was tall, slender, and of a somewhat swarthy complexion, which, with hair that for lack of a barber's services had grown long enough to brush back of his ears, and a Confederate major's brand-new uniform, gave him such a close resemblance to his erring but gallant countrymen of the South that his most intimate friend would not have suspected him of being a Yankee. His men were quite as successfully fitted out in captured clothing, and after receiving

instructions at my own headquarters to report frequently by courier, he gaily set off on what afterwards proved to be a most successful expedition. Verbal orders were also given to the other division and brigade commanders to send out similar parties, and they did so without delay.

Yeoman and his followers marched rapidly towards the upper crossings of the Savannah River, entered South Carolina, and by diligent but cautious inquiry and much hard riding found and joined the party they were looking for, without attracting unusual attention to themselves. The country was full of disbanded Confederate soldiers, all more or less demoralized and going home. Discipline was at an end, and every man of them was looking out for himself. This condition of affairs facilitated the operations of Yeoman, and encouraged him to believe that he might find an opportunity to seize and carry off the rebel chief; but the vigilance and devotion of the escort rendered it impossible to put this daring plan into effect, though it did not prevent his sending couriers into the nearest Federal picket post to report the movements of the party he was with. The information thus obtained was promptly transmitted to Generals Alexander and Upton, and by them to me. At Washington, Georgia, there was much confusion, growing out of the further disbanding which was rendered necessary by the proximity of our forces, and Yeoman lost sight of Davis for about twenty-four hours, during which he divided his party into three or four squads, and sought again to obtain definite information of the Confederate chieftain's movements and plans. Persevering in his efforts, he learned enough to convince him that Davis had relinquished all hope of getting through the country to the westward, and would most probably try to reach the South Atlantic or Gulf Coast and escape by sea. This, it will be remembered, was the plan which Pollard, the historian of the Lost Cause, says was deliberately adopted, many weeks before Lee's catastrophe. Relying upon his information, Yeoman sent in couriers to make it known, and as soon as it reached him Alexander repeated it to me by the telegraph, which was now completely in our possession. The air was full of rumors, and everybody had a theory to advance as to the probable movements of the party we were

so anxious to apprehend; but after careful consideration of all the reports and the few absolute facts which had reached me I had already come to the conclusion that Davis would be forced to flee, probably alone and in disguise, towards the Florida coast, and reported to Thomas that I had no doubt we should catch him if he undertook to pass through the country attended by an escort and a wagon-train.

On the afternoon of May 6, immediately after receiving the intelligence from Yeoman, I sent for General Croxton, commanding the First (McCook's) Division, and directed him to select his best regiment in his division, and send it forthwith, under its best officer, eastward by the little town of Jeffersonville to Dublin on the Oconee River, with orders to march with the greatest possible speed, scouting the country well to the northward of his route, leaving detachments at all important cross-roads and keeping a sharp lookout for all rebel parties, whether large or small, that might be passing through that region. It was hoped by these means that the route pursued by Davis might be intersected and his movements discovered, in which event the commanding officer was instructed to follow wherever it might lead, until the fugitive should be overtaken and captured. General Croxton selected the 1st Wisconsin Cavalry, commanded by Lieutenant-Colonel Henry Harnden, an officer of age, experience, and unconquerable resolution, who reported to me after his regiment was on the march, and whom I notified that Davis was known to have an escort variously estimated at from ten to fifty men, all fully armed, and determined to die "in the last ditch," if need be, in his defense. The sturdy old colonel understood fully what he might encounter and what was expected of him, and assured me as he galloped away that he would give a satisfactory account of himself and command if he should have the good fortune to find the party he was sent after. He had selected 150 of his best men and stoutest horses, and, marching all night, he reached Dublin the next evening at seven o'clock, having left an officer and thirty men at Jeffersonville with orders to send out scouts in all directions. During his march he had kept scouting parties well out on both sides of his column in hopes of finding the trail of the party for whom he was searching, but nothing of importance occurred till after he had bivouacked for the night.

Meanwhile the conviction was growing in my mind that Davis would certainly try to pass through eastern Georgia into Florida, and accordingly the next day—May 7—I sent for Colonel Minty, commanding the Second

(Long's) Division, and directed him also to select his best regiment and order it to follow the southern bank of the Ocmulgee River, watching all the crossings, and seizing all the boats between Hawkinsville and the mouth of the Ohoopsee River. Minty selected the 4th Michigan Cavalry, his own regiment, commanded by Lieutenant-Colonel Benjamin D. Pritchard, an officer of rare ability and enterprise. He received the same information and instructions that had been given to Harnden in regard to the strength and character of the escort which was supposed to be with Davis, and was directed to find and follow the party to the Gulf of Mexico if necessary and bring it in if possible. Pritchard, leaving behind his weaker horses, set out immediately with the rest of his regiment, and proceeded rapidly in the direction indicated.

The excitement had now grown to white heat, and every officer and man in the force was on the alert. Upton had telegraphed me from Augusta as early as the 6th, suggesting that I should offer a reward of one hundred thousand dollars for the capture of Davis, urging in support of his advice that the Secretary of War would approve my action, and that it would induce even the rebels to assist in making the capture. I did not care, however, to commit the Government in that way, and decided, instead, to offer a reward to be paid from the treasure which the fleeing chieftain was thought by General Halleck, and perhaps others, to have with him. This was done, and printed copies of the offer were scattered throughout the State as soon as possible.

At this time the cavalry corps, consisting of about fifteen thousand horsemen, was holding all the important points along a line extending from Kingston to Tallahassee, with one brigade and many smaller detachments moving in all directions to the front and rear, and the sequel showed that I was fully justified in believing that Davis and his party could not possibly escape unless they left the roads and took to the woods as individual fugitives.

On his arrival at Dublin, Harnden made careful inquiry, but the white inhabitants of the place expressed complete ignorance and indifference in regard to the movements of all parties and detachments such as might accompany the rebel leaders, though they were unusually profuse in offers of hospitality to himself and his command. This being a trait of Southern character that the bronzed old cavalryman had never before seen exhibited to any marked extent, his suspicions were at once aroused, and, declining all attentions, he went into bivouac at the edge of the village, resolved to sleep with one eye open if he slept at all. He had

\$100,000 REWARD! IN GOLD.

Headquarters Cav. Corp.,
Military Division Mississippi,
Mobile, Ala., May 6, 1865.

One Hundred Thousand Dollars Reward
in Gold, will be paid to any person or persons who will apprehend and deliver JEFFERSON DAVIS to any of the Military authorities of the United States.

Several millions of specie, reported to be with him, will become the property of the captors.

J. H. WILSON

REDUCED FACSIMILE OF A TORN POSTER FOUND IN GEORGIA AFTER THE WAR BY MR. REAU CAMPBELL.

already observed unusual commotion among the colored people, and aftersending out scouts and posting his pickets he composed himself for the night.

About eleven o'clock, after complete stillness had settled upon the bivouac, a negro man came stealthily to the colonel's tent and told him with bated breath that he had assisted the ferryman that day in bringing Mrs. Davis and family from the east to the west side of the river; that the party was composed of men, women, and children, about twenty in all; that they had three ambulances and five wagons, and after crossing had gone south on the river road. He was sure that it was Mrs. Davis and family, because he had heard one of the ladies addressed as "Mrs. Davis," and an elderly gen-

tleman, with a defective eye, riding a fine bay horse, spoken to as "Mr. Davis" or as "President Davis." The colored man had evidently made close observation of all that took place. He reported that "Mrs. Davis" and some of the party had not crossed at Dublin, but had gone to a ferry several miles farther down the river, and after crossing there had ridden up to the town, and rejoining the party in the outskirts they had all gone south together "on the river road." Colonel Harnden, after a rigid cross-examination of his voluntary informant, and receiving from another negro a confirmatory statement, went down to the river and called up the white ferryman, whom he again questioned closely, but from whom he failed to elicit any additional facts. Indeed he got

nothing whatever from him, except the conviction that, for a white man, the ferryman was an unusually ignorant and reticent person.

Returning, however, to his camp and reflecting upon the story of the colored man, he concluded that it was too probable and circumstantial to be disregarded. He therefore detailed Lieutenant Theron W. Lane with sixty men to scout from Dublin as a center, in all directions, and especially towards the sea-coast, while he resolved to start at two o'clock with the remainder of his regiment, not exceeding in all seventy-five men and officers, in pursuit of the party about which he had gathered such circumstantial details. With horses well fed and groomed, and his troopers refreshed by a short sleep and by the bountiful supplies of a region which had entirely escaped the ravages of the foragers, he took to the saddle at two o'clock, the darkest hour of the night, determined to overtake the fugitives, wherever they might go. As nearly as he could make out, they had sixteen or seventeen hours the start of him; but as they were encumbered with ambulances and wagons, he felt that the chances were largely in his favor. He had some difficulty at first in finding the right road, which, like all the rest in that region, was at best an obscure path through the forest; but five miles out he obtained information from a woman of the country which convinced him that he was moving in the right direction, and that Davis in person had gone by the day before. This was on the morning of May 8. The colonel at once sent a courier across country with a despatch for General Croxton, informing the latter of his discovery and his general plan of operations, and then pushed on rapidly in pursuit. It is worthy of note, however, that the courier lost his way and was captured, dismounted, and robbed, and did not reach Macon till after the news of Davis's capture had been received. The route by which the latter was traveling led nearly due south through an almost unsettled and trackless but level and sandy region of pine forests, made still more difficult by creeks and swamps crossing and frequently obliterating the road for miles. It began to rain about noon, and this speedily washed out the wagon-tracks and left the pursuers in doubt as to the trail which they were following. After a while they impressed an unwilling "cracker," as the inhabitants of that region are called, and forcing him to act as guide, they pushed forward till they felt sure they were again on the right road. Allowing him to return home, they continued the march till they came to the swamps of Alligator Creek, where the trail disappeared under the water, and they were once more forced to draw rein till another "cracker" could be

found to guide them through the swamp and forest to the path which seemed so illusive, and upon which the trail of the fugitives was so faintly marked. Notwithstanding the delays, Colonel Harnden and his troopers bivouacked that night forty miles south of Dublin. Having no tents, they lay on the ground, and as it rained heavily during the night, they were again drenched to the skin. As a consequence it was more comfortable for the men in the saddle than in their dreary camp, and so with much impatience they mounted and resumed their march at the early hour of three o'clock the next morning.

The route, as before, lay due south, across creeks and swamps and through an almost uninhabited forest, but by noon it brought them to Brown's ferry, where they crossed to the south side of the Ocmulgee. The river was found to be too deep for fording, and its banks so steep and treacherous that the prudent colonel, anxious as he was to get forward, would not permit his command to swim it. Accordingly a rickety old scow, on which the fugitives had crossed only a few hours before, was brought into requisition; but it was overloaded, and under the burden of the first detachment it sprung a leak, which threatened to disable it entirely, and in fact came so near doing so that it was found necessary to limit the loads afterward to four or five men and horses. There were no means at hand for making repairs, and the crossing was thereby prolonged nearly two hours beyond what otherwise would have been necessary. The time was not altogether lost, however, for it afforded Colonel Harnden an opportunity to gather from the ferryman and his assistants such particulars of the party he was pursuing as to remove all doubt, if any existed, in regard to its identity and strength, and also in regard to the route it had taken after crossing the river.

At Abbeville, a hamlet of three families, about a mile and a half below the ferry, he found some corn, and halted to feed his jaded horses. At 3 P. M., just as he was renewing his march, he met the advance guard of the 4th Michigan Cavalry, Lieutenant-Colonel Pritchard commanding, coming down the river road from Hawkinsville. After comparing instructions with that officer, and telling him about the party he was pursuing, he rejoined his own command and continued his march by the road from Abbeville to Irwinville until again compelled by darkness and the consequent difficulty of following the trail to go into camp. This he did about nine o'clock at night, after he had got within two or three miles of where he supposed the fugitives had also been compelled to halt. Here he unsaddled, and after posting pickets and enjoining the most perfect

silence, he sent his horses out to graze for a while before allowing his men to rest. Declaring his purpose to renew the pursuit before dawn the next morning, in the hope of falling upon the camp of the rebel party before it had resumed its march, he threw himself upon the ground and slept soundly for a few hours.

It will be remembered that Colonel Pritchard, who belonged to the Second Division, had left Macon about dark on the evening of May 7, and that his attention had been particularly directed to the crossings of the Ocmulgee between Hawkinsville and Jacksonville, for the purpose of watching the ferries and intercepting Davis and such other important Confederate leaders as might be trying to escape through that region. He had practically the same orders that had been given to Harnden, except that his preliminary line of march was to be southeastward along the southern bank of the Ocmulgee, while Harnden's was to be due east to the Oconee and beyond. Exactly what words passed between these two officers when they met have never been fully reported or agreed upon, but as they were veterans of most excellent character, it is fair to assume that each gave the other all the information he had, after which they parted, Harnden to rejoin his command on the Irwinville road, and Pritchard to continue on the route above indicated. [See page 594.] The latter had not gone far, however, before he met a negro man who gave him such additional information as convinced him absolutely that the party which Harnden was pursuing was the one they were both looking for, and that it was his duty to join in the pursuit. Accordingly he selected seven officers and 128 of his best-mounted men, and after leaving the rest of the regiment under Captain John C. Hathaway, with orders to carry out his original instructions, he set out at a brisk trot. It was now four o'clock, and the route chosen by him led southeasterly along the river nearly twelve miles to the neighborhood of Wilcox's mill, where it turned sharply to the southwest in the direction of Irwinville, some eighteen miles from the river. Night soon overtook the hardy cavalymen, but they pressed on through the overshadowing forest and reached Irwinville between one and two o'clock in the morning. Although this is the county seat of Irwin County, it is an insignificant village, which till that hour had escaped all the alarms of the war; but the presence of so large a body of cavalry soon became known, and caused great excitement among both whites and blacks. Fearing that the alarm would extend to the neighborhood unless promptly allayed, the colonel represented his command as the rear-guard of Davis's escort, and after restoring

order thereby had the satisfaction of learning that the party he was searching for had encamped that night at the creek, about a mile and a half north of the village, on the Abbeville road. Feeling confident that the fugitives were now within his grasp, he marched noiselessly, under the guidance of a negro from the village, to within half a mile of the camp, where he detached Lieutenant Alfred B. Purinton and twenty-five men, with orders to dismount and work their way quietly through the woods to a point on the road north of the camp. He hoped by this means to interpose between Davis and his escort, and to cut off all chance of escape. In case of alarm or discovery, he directed the lieutenant to turn at once towards the camp from wherever he might be, while the principal force, under his own immediate command, would be held in readiness to charge the camp along the main road.

These dispositions were carried into effect without the slightest noise or disorder, and everything was in readiness to close in upon the sleeping chieftain and his attendants; but unfortunately Colonel Pritchard had failed to apprise Colonel Harnden of his plan of operations, and the latter, entirely unconscious of what had occurred since he left Abbeville at three o'clock the previous afternoon, had called his men without the blare of bugles from their slumber, and after a hasty breakfast of coffee and hard bread had taken the road to gather in the party which he had been pursuing with such untiring industry for two days and nights. He had thrown out an advance guard of six men, and directed Sergeant George G. Hussey, in charge, to answer no challenges, but to wheel about as noiselessly as possible and rejoin the main body as soon as he encountered any force on the road. With this disposition made, the colonel and his troopers had covered but little more than two miles when the sergeant was challenged by an unknown party only a short distance ahead of them. There was as yet no show of dawn, and the shadows of the pines, which here constitute the entire forest growth, rendered it impossible to see twenty feet ahead. The sergeant alleges that he replied "All right; friends!" and wheeling about promptly rejoined the column in the rear, but as he did so he was followed by a rattling carbine fire, which of course brought the colonel at once to the front. Without the slightest delay the latter detached a part of his force to move rapidly through the woods upon the flank and rear of the party they had encountered, and ordering the rest of his men to dismount and "fight on foot," he charged straight down the road, regardless of what he might encounter. A sharp fight ensued, but it was soon discovered that the men in front were Purinton's detach-

ment of the 4th Michigan Cavalry instead of the enemy. In this untoward affair one officer of the 4th Michigan was wounded and two men killed, while three of the 1st Wisconsin were severely, and several slightly, wounded. It has always been a source of regret to those concerned that this skirmish took place, and yet it is difficult to see how, under the peculiar circumstances of the case, it could have been avoided. Colonel Pritchard reports explicitly that he had sent a courier to warn Colonel Harnden and had cautioned Lieutenant Purinton to keep a sharp lookout, but withal Harnden remained entirely unconscious that the Michigan men had got around him, and pressed on under the supposition that the force in front could be no other than Davis's escort.

Meanwhile, Colonel Pritchard with his main body, preceded by Captain Charles T. Hudson and twelve men, charged through the somewhat straggling camp just as the first signs of dawn began to show themselves. He at once threw a cordon of mounted troopers completely around the space covered by it, and had sent some dismounted men to the tents and wagons for the purpose of securing such prisoners as they might contain, when the woods resounded with sharp firing beyond the creek in the direction of Abbeville, but apparently close at hand. The camp was now completely aroused, and much commotion followed, but the colonel did not tarry to take account of his captures. Hurriedly consigning that task to his adjutant, he gathered all the men that could be spared, and rode at once towards the scene of conflict, arriving there just in time to receive the volley which brought the unfortunate affair to an end.

During the skirmish and the absence of Colonel Pritchard, which must have lasted ten or fifteen minutes, the adjutant, Lieutenant J. G. Dickinson, having taken every precaution for securing the entire camp and its occupants, had gathered up a few stragglers and sent them to the front, and was about to go in the same direction himself, when his attention was called by one of his men to "three persons dressed in female attire," who had apparently just left the large tent near by and were moving towards the thick woods. He started at once towards them and called out loudly and imperatively, "Halt!" but not hearing him, or not caring to obey, they continued to move off. The command was repeated in louder tones, and this brought several troopers under Corporal Munger from the outer cordon, and as they confronted the party of three with carbines "advanced" and a threatening air, the latter halted, and in the confusion which followed it became evident

that one of them was Mr. Davis in disguise, and that he was accompanied by Mrs. Davis and her sister, Miss Howell.

Shortly afterwards, and before the party had reëntered the tent, Colonel Pritchard accompanied by Colonel Harnden returned from the front, and rode up to the group which had now become the center of interest. Davis, who had not yet recovered his equanimity, although he had been permitted to throw off his disguise, recognized them as officers of rank, turned fiercely upon them, and asked which of them was in command. It will be remembered that these officers were lieutenant-colonels from different States, belonging to different brigades and divisions, and had probably never met till the day before; hence it is not strange that they had not compared dates of commissions, nor that they were somewhat disconcerted by the question of their imperious prisoner.

Noting their hesitation, the latter upbraided them sharply, charged them with incompetency and unchivalric conduct, and finally declared that they could not have caught him but for his desire to protect his "women and children." Whereupon Colonel Pritchard, who was a man of self-possession and dignity, said: "I am Lieutenant-Colonel Pritchard, commanding the 4th Michigan Cavalry, and this is Lieutenant-Colonel Harnden, of the 1st Wisconsin Cavalry. We don't know who holds the oldest commission; but that is not important, for between us we shall doubtless be able to take care of you and your party." This ended the conversation, and after a hurried breakfast the captors began their return march to Macon.

Mr. Davis and his family were carried in the ambulances, followed by the wagons containing their baggage and supplies. It should be remembered that the troops had drawn no regular Government rations since leaving the Tennessee River, and were therefore compelled to subsist by foraging. The country being but sparsely settled and poorly cultivated, all kinds of provisions were scarce, and consequently the men had now begun to suffer for food. Discovering that the captured train contained more food than could possibly be consumed by the prisoners, Colonel Pritchard on the way north decided to distribute the surplus to his men, but before doing so politely requested Mr. Davis to direct his cook to set apart enough to last for the few hours which would bring them to Macon. Much to his surprise and annoyance, Mr. Davis declined, strenuously protesting that the supplies were private property and should not be disposed of as the colonel had proposed. A sharp conversation ensued, during which Mr. Davis lost his temper, declared that he never expected to be

compelled to submit to such indignities, and that if he could have got possession of his arms at the time of his capture he would not have been taken prisoner. Colonel Pritchard asked quite naturally, "How could you have prevented it, Mr. Davis?" "Why, sir," replied the now thoroughly angered chieftain, "I could have fought you, or I could have eluded you."

Replying to this somewhat boastful speech, the colonel said impressively, and, in his own words, "perhaps a little acrimoniously," "As for fighting us, we came prepared for that: it would have saved us some trouble and doubtless you a good deal; but as for 'eluding us,' I don't think your garments were on that occasion particularly well adapted for locomotion or for the use of firearms." To this Mrs. Davis retorted sharply, saying, "I want you to understand distinctly that Mr. Davis assumed that disguise at my instance."¹

It is proper to say that Mr. Davis denies the accuracy of this story, and Mr. Reagan, who was captured with the party, but was not present at the interview just described, also denies it; but I see no reason whatever for doubting the statement of Colonel Pritchard. He is a cool, self-possessed, and honorable gentleman, and quite incapable of giving currency to any other than a truthful statement of what actually took place.

Upon mustering the prisoners immediately after the capture, it was found that in addition to Mr. Davis and Mr. Reagan the national troopers had taken Colonel Burton N. Harrison, private secretary; Colonels Johnston and Lubbock, aides-de-camp; four inferior officers and thirteen private soldiers; besides Mrs. Davis, Miss Howell, two waiting-maids, four children, and several colored servants. Only one member of the party, and that a private soldier, succeeded in avoiding capture.

The circumstances of this capture, which summarily and forever put an end to all plans for the further continuance of the war, have been described with more or less particularity in the official reports, and in sketches based upon them or upon the less formal statements of those who participated therein. It is needless to add that I was not personally present, and therefore that in all I have said or written about it I have been compelled to depend in a large degree upon the observations and testimony of others. Both officers and men present have declared that Jefferson Davis when arrested was endeavoring to escape disguised as a woman,

and they so reported to me. In the belief that this was true, and that under the peculiar circumstances of the case the fact was an important one, I mentioned in the telegraphic reports which I sent at once to the Secretary of War and to my immediate military superiors, that he had been caught "in his wife's clothes," but I gave no details, and specified no particular articles of clothing. The reports were immediately flashed to all parts of the country by the telegraph, and the newspapers and illustrated journals supplied all the details from the imagination of their writers and artists. No official, so far as I know, ever asserted that the Confederate chieftain was caught in crinoline or petticoats, and yet his friends and admirers everywhere hastened to deny that allegation, and some of them have gone so far as to say that he was not disguised at all, and that the whole story was a "disgusting tissue of falsehood." It will not be forgotten that the country was at that time hung in black and plunged into the deepest sorrow for the assassination of Mr. Lincoln, and that so long as the Confederate chiefs were at large, breathing the spirit of war and threatening to carry it on with fire and sword more fiercely than ever, there was no certain assurance of peace. But when the news came that Jefferson Davis had not died in "the last ditch," but had been caught in the act of stealing away in the encumbering clothing of his wife, it was evident to the most infantile mind that the war was ended completely and forever. The articles of his disguise were afterward procured from Mrs. Davis by Colonel Pritchard, acting under the orders of the War Department, and were delivered by him to General Townsend, the Adjutant-General of the army,² for safe-keeping. Mrs. Davis and her son selected or verified them at the time, and there can be no reasonable doubt as to their identity. In the charge into the camp the advance guard passed well through, while the main body swung round and enveloped it entirely. Lieutenant Dickinson, the adjutant of Colonel Pritchard's regiment, says in the *Detroit "Tribune"*:

In this movement I met in front of a small fly tent Colonel Harrison, Davis's private secretary, as I afterwards learned. I stopped and made inquiry as to their force in camp, and while he was replying I heard some one calling me. I turned and saw private Andrew Bee of L Company, who, pointing to three persons dressed in female apparel, at some distance and moving away, called out to me, "Adjutant, there goes a man dressed in woman's clothes." I started at once after them, calling out "Halt!" repeatedly and reaching them just as several troopers in charge of Corporal Munger dashed up, bringing their carbines ready for use. The fugitives halted. Mrs. Davis threw her arms around her husband's shoulders, and [with] the lady close to him formed a

¹ For other interesting details of the capture of Davis, see the article prepared by Colonel Pritchard and published in the "*Allegan Journal*," March 30, 1878.

² In an interview printed Dec. 7, 1889, General Townsend confirms this statement.—EDITOR.

shield which was respected. I noticed several Confederate officers near; one, a tall fellow, was apparently very much excited.

Davis had on a black dress, and though it did not fit fairly at the neck, it covered his form to the boots. The boots betrayed his disguise. A black shawl covered his head and shoulders. His identity was confirmed by the removal of the shawl from his face. I promptly directed him to retire to his quarters, and ordered Corporal Munger to place the men with him and keep careful guard.¹

This statement, made by an officer of rank and intelligence, is conclusive, and it is confirmed by the statements of Corporal George Munger and privates James F. Bullard and Andrew Bee. The latter says that Mrs. Davis remained in the tent with the children, and that the three women who started for the brook were Mr. Davis, Miss Howell, and a white servant-girl, "Mr. Davis stooping over as a very old woman would, so that his head was not on a level with Miss Howell's, but was lower." He adds: "Mr. Davis had on a black morning-gown, belted at the waist, a shawl over his head and shoulders, and a black cloth under the shawl covering his forehead. They had got about six or eight rods from the tent when I, who had been watching them all the time, saw that the old woman had on boots. I at once said to Dickinson: 'See, that is Jeff himself! That is no woman! That is old Jeff Davis!' and started on the run after them. As I got up to them I exclaimed: 'Halt! — you, you can't get any farther this time!' Mrs. Davis at that moment came running out of the tent, and when she reached Mr. Davis she put her arms around his neck and said, 'Guard, do not kill him!' At the same instant Corporal Munger of Company C, mounted, came from another direction and headed Davis. . . . The only portion of the face of Mr. Davis which could be seen when he was disguised were the eyes and nose, he covering the mustache, mouth, and beard with the shawl held close with one hand."

Private William P. Stedman [see page 595] of Company B, 4th Michigan Cavalry, confirms the statement of the others in regard to the disguise and the effort of Davis to escape as an old woman going to the run after water; but if further proof is still required as to the substantial accuracy of the story, it is furnished by Captain Charles T. Hudson, in a letter of July 24, 1875, to the "Detroit Tribune," from which I make the following extract:

I was not the first to see our distinguished captive, nor did I see him in his disguise at all. Several claim that honor, and I have no doubt all speak the truth.

¹ See "Annals of the War, Written by Leading Participants," etc., p. 580 *et seq.*

² For the full text of the letters and statements quoted from in this article, and also for a careful and

On our way back to Macon, however, Mrs. Davis told me, and I will use her own words: "I put my waterproof cloak and shawl on Mr. Davis, upon the impulse of the moment, not knowing or having time to think what else to do, in hopes that he might make his escape in that disguise, and I only did what any true woman might have done under similar circumstances." . . . If fuller proof is wanting let me add that upon our arrival at Fort Monroe, with our prisoners, acting under orders of the Secretary of War, I was sent on board of the *Clyde*, then lying in Hampton Roads, to get the shawl (the waterproof having been obtained the day previous by Colonel Pritchard) worn by Davis at the time of his capture. Upon making known my business to Mrs. Davis, she and Mrs. Clement C. Clay, particularly the latter, flew into a towering rage, and Mrs. Clay, stamping her foot on the deck of the vessel, advised Mrs. Davis "to shed her blood before submitting to further outrage." After telling Mrs. Davis my orders were imperative and that she had better submit gracefully to my demands, she became somewhat pacified, and said *she* "had no other wrappings to protect *her* from the inclemency of the weather." I then told her I would go ashore and buy her a shawl, which I did, paying six dollars for it. Upon presenting it to her, she held it up, and with scorn and contempt turned to Mrs. Clay and exclaimed, "A common nigger's shawl!" She then handed me two shawls very similar in appearance and told me to take my choice, adding that she did dress Mr. Davis in her attire and would not deny it, at the same time expressing great surprise that the Secretary of War should want her clothing to exhibit, as if she had not already been sufficiently humiliated.²

Mr. Reagan, Mr. Harrison, Mr. Pollard, and even Mr. Davis's colored servant Jones, have with more or less ill temper and earnestness denied the story of the disguise; but each has admitted enough of what has been alleged by the captors to prove its substantial accuracy, and in the face of the positive and overwhelming testimony of the eye-witnesses and participants it would be conclusive if it were not absolutely confirmed by Davis's own story, as published in the "Rise and Fall of the Confederate Government," pp. 701, 702. [See page 566.]

As for myself, I did not see Mr. Davis till he had arrived at my headquarters at Macon on the afternoon of May 13. When the cavalcade reached the city the streets were thronged by crowds of rebel citizens, but not one kindly greeting was extended to their fallen chieftain or his party. Of course he and they were closely guarded, but no one was prohibited from expressing his personal feelings or offering a friendly salutation. The party was assigned to rooms in the hotel which I was occupying, and my own servants gave the tired and hungry travelers the best dinner that they could

judicious summary of the proofs in regard to the disguise, made by Colonel Robert Burns, 4th Michigan Cavalry, see "Annals of the War," pp. 580-586 inclusive.

possibly provide, and otherwise treated them with every courtesy and attention.

After dinner I had an interview with Mr. Davis, lasting more than an hour. He looked bronzed, but hardy and vigorous, and had entirely recovered his customary equanimity and distinguished bearing. As we were both graduates of the Military Academy, and he had been Secretary of War at the time I was appointed, and had visited West Point while I was a cadet, the conversation naturally enough turned upon common recollections. He asked about his old friends the professors, and discussed them and their peculiarities with easy good-humor and kindly discrimination, after which I led him to the discussion of the graduates who had become leading generals in the two armies. He spoke in the highest terms of Lee, declaring him to be the ablest, most aggressive, and most courageous, and in short the most worthy and best beloved of all his lieutenants. He spoke slightly of Johnston, and charged him with timidity and insubordination. He ridiculed the pedantry of Beauregard, and deprecated the gallant rashness of Hood. On the other hand he expressed his surprise at the astonishing skill and persistency of Grant, and his admiration for the brilliancy of Sherman and the solid qualities of Thomas. His comments and criticisms were clothed in excellent language, and were delivered with grace, while his manners were stately and dignified without being frigid or repellent. During the conversation he referred to Mr. Lincoln and his untimely death, speaking of him and his service in Congress in terms of respect and kindness, if not of high admiration. He seemed particularly sorry that a man of so much sensibility and kindness had been succeeded in the presidency by Andrew Johnson, whom it was evident he did not like, and whom he

feared would be governed in his relations with the Southern people by a vindictive and unforgiving temper. He remarked in regard to the reward offered by the latter for his arrest, and which he heard of for the first time on the road from Irwinville to Macon, that, while he was surprised and pained at the charge which had been made against him, of complicity in the assassination of the President, he had no serious apprehension of trouble therefrom. In this connection he said, "I do not doubt, General, the Government of the United States will bring a much more serious charge against me than that, and one which will give me much greater trouble to disprove"—doubtless alluding to that of treason.

During our interview he sent for his little son and introduced him to me. His conduct throughout was natural and eminently self-possessed, and did not reveal the slightest uneasiness or apprehension. It created in me the impression that, although he was a prisoner of war, he still felt that he would become an important factor in the reconstruction of the Union. After learning from me that he was to be sent at once via Atlanta and Augusta to Savannah, and thence by sea to such point North as the Secretary of War might designate, he said: "I suppose, as a matter of course, that Colonel Pritchard is to be my custodian hereafter as heretofore; and I desire to express my satisfaction at this, for it is my duty to say that Colonel Pritchard has treated me with marked courtesy and consideration. I have no fault to find with him, and beg you will tell him so. I should do so myself but for the fact that it might look like a prisoner's effort to make fair weather with his captors." He spoke particularly of the dignity and self-possession of Colonel Pritchard, and did not conceal a regret that he had not been so fortunate in his own conduct at the time of his capture.

James Harrison Wilson.

II.—BY AN EYE-WITNESS.

AT Abbeville, South Carolina, we of the 4th Michigan Cavalry met Colonel Harden of the 1st Wisconsin Cavalry, who said a detachment of his regiment had crossed the Ocmulgee and had gone south, and that the party that crossed the river the night before was Jefferson Davis and some refugees from Richmond. He said that he had been following them for two days, and he claimed the first right to the road, which was consented to by Colonel Pritchard of the 4th Michigan, who besides offered to lend Colonel Harden a part of his regiment. The latter refused the offer and proceeded south towards Irwinville,

Georgia, on Davis's trail. Soon afterward Pritchard learned that there was another road to Irwinville, but it was considerably farther than the road Davis had taken, and nearly twenty-four hours had elapsed since Davis had crossed the river. But Colonel Pritchard concluded to take this road with 120 of his best-mounted men and seven officers, leaving the rest to picket and scout the country around, according to former orders. Captain Charles T. Hudson was given charge of the advance guard, of which I was one. About four o'clock P. M. we took the river road to Wilcox's mill, about twelve miles distant. There we halted

and fed our horses. Then we took an old trail for Irwinville, through an unbroken pine forest, reaching there about two o'clock in the morning of the 10th. It was a bright moonlight night. We soon learned by examining the roads that the Davis party had not passed, and that they must be north of us if they had not taken some other road. The command halted at Irwinville, and orders were given for all to keep by their horses, but two of our men strayed away in search of something to eat. They found a meat-house, and in trying to get into it they disturbed the family in the dwelling-house adjoining it, when a woman put her head out of a window and ordered the men away, saying, "I know where you belong; and if you don't go away I will go to your camp in the morning and report you, for I know that your party does not allow such work." The boys took in the situation at once, and replied that they had lost their way, and wanted to know if there was any one in the house that would show them the way to camp. The woman said there was a colored man in the house that would show them the way. When the man came out the boys took him to Colonel Pritchard and informed him of what they had learned. After asking the man a few questions the colonel dismounted the command, except those that had been in the advance guard under Captain Hudson. The dismounted men, with the colored man for a guide, were sent to establish a line of pickets around the Davis camp. The advance guard was held back on the road until it began to show daylight in the east; then we were to advance on the camp. We marched right into the camp, without disturbing any one, until Captain Hudson said, "Go for them!" Then we gave a yell, and the men went for everything they could find. The camp was situated on a slight elevation of ground in a pine forest, but the timber did not stand very thick where the camp was. There was a creek, with considerable thick brush along it, running round the north and east sides of the camp, about twenty or twenty-five rods away. There were two wall tents and a shelter tent on the east side of the road, and the horses and wagons and ambulances were on the west side of the road, and the men of the camp were seen lying in the wagons and under the trees, for the surprise was so sudden that they had not got out of their beds. There was one tent larger than the rest, and I thought that if Davis were in the camp he would be in this tent, so I stopped my horse near the southwest corner of the tent and waited to see what would come out of it. The tent door was on the east side of the tent, and I could not see it, but a man could not get more than three or four feet from it without my seeing him.

As I sat there some of our men went to the tent door, but were met by a woman who would ask them to keep out, saying that there were undressed ladies within. I heard this same voice several times, and it proved to be Mrs. Davis who was speaking. About this time firing was heard on the north side of the camp. Captain Hudson ordered the men out to where the firing was, except a few men to watch the camp. Soon after the firing began, this woman in the tent asked some one without if he would let her servants pass out after some water. Consent was given, when out came a tall person with a lady's waterproof overdress on and a small brown shawl on the head, a tin pail on the right arm, and a colored woman leaning on the left arm. This tall person was stooping over as if to appear shorter; I at once concluded that it must be Davis in disguise.

They started off east towards the creek, where the brush was very thick. As they were going they had to pass several soldiers who were straggling round the camp. I sat still on my horse, expecting that some of the soldiers would halt them as they passed by; but such was not the case, for they passed all of the soldiers without being noticed. Then I galloped my horse round the north side of the tent and, passing to their left, halted them. Just at this time there came riding up to us two of our soldiers. They made a few remarks to the tall person. He turned his face a little towards me and I saw his gray mustache. We told him his disguise would not succeed. Then Davis and the colored woman started back towards the tents. I rode by the side of Davis, and the two soldiers (Corporal Munger of Company C, and Daniel Edwards of Company L) rode away in another direction. As Davis had got about half way back to the tent, we were met by some of our men, who had just discovered that Jefferson Davis had tried to escape in disguise. A man by the name of Andrew Bee, a Swede, who was cook for Colonel Pritchard, came up on the run, and grabbed both hands into the front of the dress that Davis had on, jerked it open, and said to him, "Come out of this, you old devil!" Davis at this attack straightened up and showed anger. At the same time he put his hand to his back under the dress. I thought he was after a revolver, and covered him with my carbine, and cocked it. As I did so Mrs. Davis, who stood at the tent door, cried out to me not to shoot. She came running to her husband and threw herself on him in front of the gun. She said that he was not armed, for she had caused him to leave his arms in the tent before he came out. Then Davis threw the dress and shawl to the ground and started for the tent. When we reached there,

and as the soldiers were looking at Davis, Colonel Pritchard came up. I reported my prisoner to him. He asked me if I were sure it was Davis. I asked him if he had not seen Davis's picture often enough to know him at sight. Colonel Pritchard then asked Davis what his name was, and Davis answered, "You may call me what you please." Pritchard then said, "I will call you Jefferson Davis." Davis said it was immaterial to him what he was called. Colonel Pritchard then asked what the firing was for out north of the camp, but no one could tell him. He then ordered the men that were around the camp out to where the firing was, and rode there himself. As he left he said to me, "Keep a close watch of Davis." Davis then turned to me and asked if I would allow him to go across the road, where there was a fire burning. I went there with him; he sat down on a log near the fire. As we were there by the fire, a soldier by the name of Linch came up with a fine bay horse and spoke to Davis, and said, "Jeffie, here is your horse; you won't need him any more; won't you give him to me?" Davis did not answer him, but Colonel Lubbock, one of Davis's staff, was very angry towards Linch, and declared that he would die before he would see his President insulted. Linch with an oath said to Lubbock, "What is he President of?"

The firing, an accidental encounter between men of our regiment and the 1st Wisconsin [see page 590], soon stopped; the men came into camp and all had a good look at the rebel chief. The men of the 1st Wisconsin came into camp and saw Davis, but were not pleased to think that we had stolen a march on them. Our men had got their breakfast, and after a while the adjutant came round taking an inventory of the captures. I asked to be relieved from guard, so that I could get my breakfast before we marched. He then detailed a guard for Davis, myself being one of them. About eight o'clock in the morning the command started back for Macon with our prisoners by the direct road to Abbeville. That night we camped at Abbeville, and the rest of our regiment joined us there. We buried our dead at Abbeville on the morning of the 11th, and then took up our march again. The afternoon of the 12th we met our brigade, which had been sent out to assist us. It was drawn up in line on one side of the road. As we passed the band began to play "Old John Brown," and the boys sang "We'll hang Jeff Davis on a sour-apple tree." Davis was riding in an ambulance at the time and pulled down the curtains. When we met our brigade we learned for the first time that there was a reward for

the capture of Davis. We reached Macon about three o'clock in the afternoon of May 13, having been gone from camp six days, and having marched nearly three hundred miles in that time. When we arrived at Macon, Davis and the other prisoners were taken to General Wilson's headquarters, and were there about two hours. A line of guards were placed around the headquarters, and the guards had considerable trouble to keep the citizens from breaking through their line to see Davis. There was a lady, well dressed, who approached me crying and was determined to pass me and see her President. I was compelled to use force to keep her back. At Macon there was a detail made from our regiment to guard Davis to Fort Monroe.

I think that I was the only person in our command who saw the whole affair at the capture of Davis; some saw one part and some another.

In *THE CENTURY MAGAZINE* for November, 1883, there was an article by Colonel Harrison, Mr. Davis's private secretary, giving a description of the capture. So far as my knowledge goes, Mr. Harrison errs in some of his statements. He says that at the first surprise of the camp Colonel Pritchard rode up to him and asked what the firing meant north of the camp. It was Captain Hudson, whom he took for Pritchard. He says he talked with the mounted soldier near the Davis tent and persuaded him to ride away, which is a mistake. He also says that the soldiers used violent and abusive language to Mrs. Davis. There was no violent language used in my hearing, except by Andrew Bee to Mr. Davis, when he tore open the waterproof, and I was where I could have heard if any had been used. Mr. Harrison tells Colonel Thoburn's story of how he left the Davis camp in the night and ran into the 4th Michigan Cavalry near Irwinville and was fired upon by them, and that he returned the fire and got away from them. There was no firing near Irwinville that night, nor was there any noise made that could have been heard twenty rods away. Mr. Harrison also tells how Colonel Pritchard and his adjutant had a dispute about a horse that he (Harrison) had been riding. This statement is a mistake. A private by the name of Linch got the horse; at Macon Linch and one of his officers quarreled about the possession of the horse, and one Sunday morning Linch shot the horse. Linch is the same man that got Mrs. Davis's valise containing her valuables, said to amount to several thousand dollars. He hid it near Macon, and went there and got it after he was discharged from the army.

BEGINNING OF THE EDICT OF NANTES.

A CORNER OF OLD PARIS.

FEW sightseers in the French capital, or even people living there, have made their way to one of its most interesting buildings, which contains documents, paintings, and relics more interesting still, — the Musée des Archives.

Nowhere else can so many authentic documents relating to the Revolution be obtained. The Musée was formerly the Hôtel Soubise, belonging in succession to the noble families De Guise and De Rohan, and built upon the site of the Hôtel de Clisson, owned by the Constable of that name. It was in 1809 that the building was selected as the receptacle for the valuable collection of state papers, which to-day repays so well a careful investigation.

After letters signed by the Clotaires, Dagoberts, and Clovises of very early days we come to the time of the Carlovingians, and find the curious signature of the Emperor Charlemagne, which is attached to a deed giving to the Abbey of St. Denis a small monastery situated in the forest of the Vosges, the document bear-

and there are signatures of numerous monarchs, with curious sobriquets, such as le Débonnaire, le Chauve, le Bègue, le Gros, and le Simple.

The Capets follow, and countless bishops, each signature less clearly legible than the preceding; King Philip II., who went on the crusade in which Richard Cœur de Lion entirely eclipsed him; and Simon de Montfort; with many other names made familiar by history. And there before us lies the last will and testament of Louis IX., written upon a small parchment from which hangs a large seal in yellow wax fastened with silken cords. The date of this paper is 1270.

The House of Valois contributes many documents of interest; among others, in the register of the council of the Parliament of Paris, occurs an historic note relative to the trial and death of Jeanne d'Arc. The recorder of the court has roughly sketched with his pen on the margin of the page the maid herself, or rather his idea of her. She holds the sword with which she hoped to do such great things, and the banner in which she had such implicit faith, marked with the letters I. H. S. The description is given of her cruel death by burning at the city of Rouen, and heretic, apostate, idolater, liar, blasphemer of God, are only a few of the terms we find applied to her.

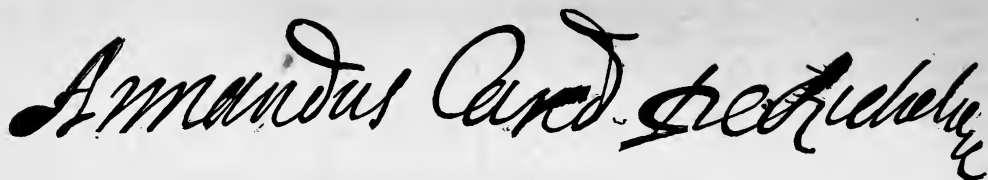

As a signature to a religious document, the one attached to the promise of John II., son of Philip of Valois, is assuredly the most amazing. The day

ing the date "13 January, 769, Aix-la-Chapelle."

There are many donations made to the same abbey, also letters from the directors of it;

 A large, elegant cursive signature in black ink, reading "Armandus Card. Richelieu".

AUTOGRAPH OF CARDINAL RICHELIEU.

of his entering Paris upon his return from St. Denis he goes direct to the Cathedral of Notre Dame, where the great closed doors open before him. Not, however, until he has sworn to maintain the rights and privileges of the church, is he permitted to cross its threshold.

A more reverential signature is that of Charles V., king of France, to the certificate of the gift of a portion of the true cross, which he delivers to his brother Jean, Duc de Berry, telling him that with his own hands he has cut this tiny fragment from the precious relic preserved in the Sainte-Chapelle du Palais. The king further urges his brother to keep the sacred gift, or to give it away, according as he may find it best for the glorification of the Catholic faith.

Not far from the paper upon which is drawn this presentation of the true cross is the treaty establishing the Jews in France, and also the first criminal register of the Châtelet prison in Paris.

From Philippe de Commines, historian and statesman in the time of Louis XII., there is a long letter, and a despatch from the French ambassadors of Francis I. to that king, relative to the marriage of Marguerite d'Angoulême with Henry VIII. of England, should he be able to break his marriage with Catherine of Aragon; Cardinal Wolsey's hesitation about the matter rendering necessary fresh orders from the French court. The treaty of the Field of the Cloth of Gold is a large parchment, illuminated, and having heavy seals attached.

A far more legible signature is that of the Queen of Scots, Mary Stuart, whose marriage contract with the dauphin of France is attested by King Henry II.; by his wife Catherine de Médicis, who spells her name "Caterine"; by Francis and Mary themselves; by Antoinette de Bourbon; by the Archbishop of Glas-

gow; and by delegates from Scotland. There is also a long letter from Mary Stuart after she became queen of France, addressed to Philip of Spain.

The signature of Prince de Condé, chief of the Huguenots, who escaped death under Francis II. only because the king himself died, and who was later traitorously killed at Jarnac, is attached to an acknowledgment of the payment of his pension from the king. There are many miscellaneous papers concerning the massacre of St. Bartholomew, and numerous letters about it, among them one from Catherine de Médicis to the Spanish king.

The larger part of an autograph letter from Henri de Bourbon, King of Navarre, afterwards Henry IV. of France, treats of the reassembling of the Huguenot army. The signature to this is bold and clear.

In this the celebrated Edict of Nantes collection are also the momentous words written eighty-seven years later by Louis XIV. revoking the edict, and suppressing the privileges granted in it. Madame de Maintenon and the Jesuit Père La Chaise, it will be remembered, were principally responsible for this revocation.

During the reign of Louis XIII. the all-powerful Cardinal Richelieu had ruled king and kingdom with a rule of iron. The Bastille was tenanted by the Prince of Condé, by marshals of France, and by numberless men of lesser rank. In the Musée des Archives are several autographic letters from Richelieu, the above autograph being the signature of a letter addressed to the Sorbonne, of which his Eminence was *proviseur*. There are signatures and signatures, but in the history of nations few have carried more weight than this.

Marie de Médicis and Anne of Austria have left several letters which are to be found in this same collection, in which is also the contract of

 A large, elegant cursive signature in black ink, reading "Le Cardinal Mazarin".

AUTOGRAPH OF CARDINAL MAZARIN.

marriage between Louis de Bourbon, Duc d'Enghien, and later "le grand Condé," with Claire Clémence de Maillé, a niece of Cardinal Richelieu.

Following Richelieu in power, and as unscrupulous in the wielding of it as had been his predecessor, came Cardinal Mazarin, and with him his dangerously beautiful niece. The facsimile given of Mazarin's signature is the one which he appended to the important treaty of the Pyrenees which gave to France, in 1659, Artois, Roussillon, and other towns, while it brought as a bride to Louis XIV. the long-suffering Maria Theresa, Infanta of Spain. Added to the signature of the cardinal is that of Don Luis Mendez de Haro.

Bastille first became a personal weapon for the vengeance of the sovereign, and that *lettres de cachet* were multiplied by thousands. These slips of paper, so easily obtained from ministers and favorites, were terribly dangerous in the hands of the unscrupulous, and were never more unscrupulously employed than while Louis sat upon the throne of France. Even Richelieu, during his term of power in the preceding reign, had masked his high-handed measures, giving for them ostensible reasons of state, but later this precaution went unheeded. Under Louis XV. the mania for poisoning had become so fashionable that high-born women, priests, nobles, and Italian professionals in the art were alike accused and *embastillé*.

LETTRE DE CACHET.

One of Mazarin's nieces, the fascinating Hortense de Mancini, who ambitiously counted upon becoming queen of France in the place of Maria Theresa, and who instead was married out of hand by her uncle the cardinal to Armand Charles de La Porte, left her husband, and ended her days in England, sometimes passing her time in London, sometimes in Chelsea, but always surrounded by a circle of men of letters and *beaux esprits*, among whom was the brilliant Saint-Évremond. In the collection of the Archives there is a receipt signed by her for the pension allowed her by Louis XIV. This receipt is indorsed by him, with his name scratched out, as it occurs in still another letter; this indicating that the payment has been made.

It was in the reign of Louis XIV. that the

Louis more than once gave warnings in time to his particular friends, as for example the Comtesse de Soissons and the Duchesse de Foix, thus saving them a compulsory residence in his château of the Bastille, but comparatively few fared so well. Two prisoners were sometimes placed in the same cell, and in this way the Italian exile was enabled to convey the knowledge of his diabolical art to one M. Sainte-Croix, the lover of the Marquise de Brinvilliers, who profited by his instructions to the extent of quietly removing her father and two brothers, for whom she seems to have had no further use. For a long time she escaped suspicion, but eventually she was accused and found guilty, all doubt of her guilt being destroyed by a detailed confession of it found among her own papers, which with

feminine perversity and recklessness she had carefully kept. She was beheaded and burned, and the *procès-verbal* of her trial is to-day to be seen in the Musée des Archives.

Other papers, the discovery of which is said to have caused consternation in every female breast in Paris, were those in the possession of Nicholas Fouquet, the ambitious minister of finance, who committed the fatal mistake of trying to outrival his master. Not only was he more magnificently extravagant than Louis XIV. himself, but he dared to raise his hopes to Louise de La Vallière, whom the king himself delighted to honor. This was his ruin. The signature of Fouquet is that appended to a letter from him to Cardinal Mazarin, and written before the celebrated fête at his château of Vaux, where the king, the court, and Louise de La Vallière were present, and soon after which he was arrested and imprisoned in the Bastille. Later he was incarcerated at Pinerolo, where he died. His devoted secretary Pellisson shared his captivity in the gloomy fortress which cast so dark a shadow over the Rue St. Antoine, and he it was who, in his loneliness, made a companion of a huge black spider, which he learned to call his friend. A savage turnkey begrudged him even this miserable solace, and one day ruthlessly crushed the spider under his heel.

The history of Louise de La Vallière is too well known to need repetition, and no one can see without a feeling of interest the original letter from her written at the Carmelite convent in the Faubourg St. Jacques, where she practiced the most severe penances in expiation of her former life. She pleads only for others, not for herself, telling the *contrôleur-général des finances* of the poverty and distress around her, for which she solicits his aid. Sœur Louise de la Miséricorde was her name "in religion," and explains the signature.

Not far from the Musée des Archives, and also situated in the corner of Old Paris called the Marais, which Victor Hugo has made immortal in his "Les Misérables," stands the house inhabited by Mme. de Sévigné for many years. It is now the Musée Carnavelet, and contains numberless souvenirs of the Revolution, notably a collection of china plates, bearing various dates, designs, and inscriptions applicable to the Reign of Terror. These inscriptions vary in length, and their orthography is sometimes peculiar, but the sentiment expressed in them never changes:

"Vivre libres ou mourir. 1790."

"Vive la République, vive les bons sansculottes Français."

This is the burden of them all. On one plate is a verse of the famous revolutionary song "La Carmagnole," to which men, women,

and children danced in blood-drunken frenzy, shrieking death as they sang, while the tumbrils carried their victims to the place of slaughter. This is the verse which one may read to-day from the Carmagnole:

Madam' Veto avait promis
De faire égorger tout Paris,
Mais le coup a manqué,
Grâce à nos canonniers !
Dansons la carmagnole,
Vive le son, Vive le son !
Dansons la carmagnole,
Vive le son du canon !

St. Vincent de Paul, Racine, Boileau, and Fénelon; the Duc de Lauzun, husband of La Grande Mademoiselle; Comtesse de Soissons, one of Mazarin's nieces; Madelaine de Scudéry; Louise de la Querouaille, whose charms induced Charles II. of England to transform her into Duchess of Portsmouth; Bossuet, Bishop of Meaux; and Philippe d'Orléans, afterwards regent, are among the list of celebrated names attached to various papers at the Musée des Archives which are to be found in the Salle Bourbon, and with the last name, Philippe d'Orléans, the shadow from the grim Bastille deepens and lengthens. The regency was one long debauch for this man, who had become ruler during the minority of Louis XV., and for his riotous crew; it was one long, grinding toil for the people, still bearing, with the dumb patience of ignorant brutes, the burdens, the blows, and the imprisonments which were their portion. And the while "the trees which were to furnish wood to build the guillotine grew higher in the forests of France."

After the regent came Louis XV. as king, the most selfish and cynical of men. He knew of the misery existing throughout the land, knew well that ruin was bound to come; but he shrewdly calculated that the fair surface which covered the actual rottenness of things would last out his time.

It was during the reign of Louis XV. that the power of the Bastille reached that dangerous height which is apt to precede a fall, and during the same reign that Henri Masers de Latude accomplished his famous escape from the fortress prison. He had come to Paris, this inexperienced young provincial, burning with enthusiasm for the beautiful Mme. de Pompadour, whose name was on every lip, but just how that name was spoken by some among the people he did not know until he strolled one morning under the chestnut trees in the Tuileries Gardens, and overheard a conversation not meant for his ears.

"Curse the woman! She has ruined the king, and is fast ruining France."

THE OATH IN THE TENNIS-COURT. (FROM A PAINTING BY A. COUDER.)

"Voltaire has rightly named her *grisette royale*, an avaricious *courtisane* who sells places, appoints to offices, revises the army list, and collects high interest on all!"

"Was not Gabrielle d'Estrées poisoned for far less than this in Henry IV.'s time? Is there no poison left, no hand cunning enough to disguise a deadly potion as a love philter, which will rid France and a suffering people of an infamous woman who rules us all?"

This is what the young man heard under the chestnut trees, and it made him thoughtful. He determined to see the Pompadour, save her, and make his own fortune at one and the same time. He forgot the tragic ending of so many others who had hoped to do the same.

Vincennes, whence he escaped, but still infatuated with the Pompadour, he weakly gave himself up to her mercy. This confidence she rewarded by promptly placing him for the second time in the prison with the eight strong towers. Even from this formidable place, from the highest cell in one of the towers, the desperate man made good his escape, accompanied by his fellow-captive D'Alègre. He succeeded in getting as far as Holland, but there he was captured and brought back for the third time to the Bastille, where he remained until after the death of Mme. de Pompadour.

In 1789 Latude found himself in Paris, and claimed from the National Assembly his ladder, manufactured from clothing sent to him in prison, and the other instruments with which

THE BASTILLE, 1788. (FROM A PRINT.)

Putting a harmless white powder into an envelope, he addressed it to the marquise at the château of Versailles, where he quickly followed it in person, and demanded to see the lady on a matter of life and death. He described the design to poison her, claimed no reward for his zeal, and only begged to be permitted to see her from time to time. The favorite was outwardly grateful but inwardly suspicious; she was not accustomed to absolute disinterestedness. Asking Latude to write his name, which he gladly did, she dismissed him with a smile, and kept the paper. In course of time the powder arrived, and proved to be harmless; the two handwritings were the same; the favorite's suspicions were confirmed, and Latude was doomed. He had dreamed of the fêtes to be given at Marly in the month of May, but when May came he and his dreams were behind the bolts and bars of the Bastille. Later he was transferred to

he had effected his escape. Prisoners of the Bastille were heroes in 1789, and they seldom asked in vain. All his prison property was restored to Henri Masers de Latude, and kept by him as relics.

There is a letter from the Pompadour in the collection at the Archives, but no facsimile of her signature is given. Although Louis XV. had allowed her to reign over him for fifteen years, and was at least supposed to care for her, he only remarked coldly and cynically, as the rain fell heavily at the moment of her death, "*La Pompadour a un mauvais temps pour son grand voyage.*"

The shadow had been slowly but surely lengthening. It no longer fell only upon Paris, but passed out at the Porte St. Antoine far across the country, where gaunt, weary men and women were hungry for bread, and tired of the haughty nobles who treated them less well than they did their dogs. Coaches, driven

madly, tore through the streets of the wretched little villages, their occupants careless whether or no children fell crushed beneath the horses' feet, intent only upon quickly reaching their lordly châteaux. Famine had come to join hands with oppression; the very ground seemed cursed, and a wail of despair rang through the land.

Then came the troubled reign of Louis XVI. Here was a young king, good, but fatally weak; a gay court reckless of all but pleasure; and a beautiful Austrian queen destined to be the supreme martyr of history. But the wail never penetrated to them in the palace of the Tuileries, or the gardens of Versailles where the little dauphin gathered fresh flowers for his royal mother every morning in the sunshine. The Bastille still frowned down upon St. Antoine, and the mysterious affair of the queen's necklace sent many to inhabit it. The Cardinal de Rohan spent ten months there before he was exiled, and among the papers at the Archives is a letter from him to the king, giving up his decoration of the Order of the Saint Esprit. Marie Nicole le Gay d'Oliva, whose resemblance to the queen enabled her to personate Marie Antoinette in the famous scene of the Trianon garden, the Comtesse de Lamotte and her husband, together with others of lesser note, were all *embastillé* on account of complicity in the affair of the necklace.

Louis XVI. accomplished many reforms during his reign. He revised the penal code, abolished torture and feudal servitude, and assured the civil rights to Protestants. The original documents of all these acts are to be found at the Musée. He generously came to the aid of America when she determined to establish her independence, and rendered valuable assistance to the cause of liberty, but was weak beyond words when his own people claimed liberty as their right and turned it into license.

The three orders of the States General held their last *séance royale* at Versailles, on May 5, 1789, after which the first two orders, the nobles and the clergy, retired; the third order, the deputies of the people, determined to work on alone. Louis XVI. refusing at first to recognize them, they could obtain no hall for their meeting until the 20th of June, when they de-

MARIE ANTOINETTE. (AFTER THE PICTURE BY L. F. WARTELL.)

termined to assemble in a tennis-court at Versailles. At this meeting all the deputies, with the exception of one, took a solemn oath to consecrate themselves to the interests of their country, in the following words: "Nous jurons de ne jamais nous séparer de l'Assemblée nationale, et de nous réunir partout où les circonstances l'exigeront, jusqu'à ce que la constitution du royaume soit établie et affermie sur des fondements solides."

This oath is always referred to as *Le serment du jeu de paume*, and the scene in the tennis-court has been immortalized by David and others.

A writer of the time says that the excitement inside the great hall was equalled only by the fury of the elements outside, where a terrific storm raged. Thunder echoed the frantic vows of patriotism made by the deputies, while vivid lightning illuminated passions blinding as itself. The original *Serment du jeu de paume*, with its long list of signatures, is to be seen at the Musée, and it is to be noted that Robespierre then signs himself De Robespierre; whereas later the aristocratic "de" is dropped.

The days went on, and Louis XVI. continued to make entries of his personal expenses in the famous "livre rouge." *Payé à la reine*, followed by sums of different amounts,

THE TAKING OF THE BASTILLE.

is a frequent entry, and the beautiful Austrian, born and brought up in the belief of the divine right of kings and queens, spent the money right royally. How could she know of that gaunt and hungry crowd clamoring for bread, when only smiles and sunshine and obsequious flattery were around her—had always been around her? No poor mother with a wailing child, no case of distress, ever came under Marie

of the darkening shadow which had been growing and deepening through the centuries?

Louis XVI. also wrote daily, with fine delicate characters, in the second "livre rouge," his personal diary. It creates a strange sensation to hold these books in one's own hand; to take up the small loose pages and read the words which by the light of after years have become so pathetic.

Antoinette's personal knowledge to which she did not give personal relief. And very carefully she taught her own children to be pitiful and kind to those less fortunate than themselves. The dauphin's baby hand more than once gave his beloved flowers to envious little ones outside the gilded gates of Versailles; the boy running afterwards to his mother, whom he adored, for a word of approval. How could she know

De Robespierre

AUTOGRAPH OF ROBESPIERRE.

On that Sunday, the 12th of July, while the king prayed, Camille Desmoulins, a young and vehement revolutionist, a friend of the people, mounted on a chair in front of the Café de Foi

in the Palais Royal, and harangued a crowd of malcontents and democrats. "It is necessary for us to select a distinctive badge by which we shall know each other," he cried. "What color will you choose? Shall it be green, the color of hope, or the blue of Cincinnatus, the color of American liberty and the democracy?"

"Give us green!" they shouted back—"green, the color of hope!"

Some hand furnished bits of green ribbon, but far too few to supply the crowd, and a hundred arms reached up to the trees above, tearing down branches and leaves, until all were furnished with the color of hope.

The king's journal continues:

Juillet, 1789.

Lundy 13. Rien.
Mardy 14. Rien.

And while he writes a great hoarse cry sounds far off—"À la Bastille!" At any price Paris had determined to become free; and so long as the dark shadow of the monument of despotism stretched across the city freedom seemed unreal. The question has often been asked, Why was the hatred of the people expended upon the Bastille, which had been essentially the prison of the great? The answer lies, I think, in these words: "La Bastille, c'était la prérogative royale; celui-là renversée, ce qui restait en France de pouvoir absolu s'écroula." The people felt this by intuition. It was not merely a prison and a citadel, this great mass of stone with bolts and bars and grated cells: it represented a principle. Once leveled to the ground, a great moral force would be withdrawn from the crown.

Tavernier was the first prisoner released; but liberty came too late—he was mad. Two others were found in a cell of one of the towers, and four men in other parts of the building—seven in all. The mysterious man with the iron mask, the supposed brother of Louis XIV., had disappeared; Cagliostro the "Sorcerer" had gone to London, whence he had written that he would return to France when the Bastille had become a public promenade. All the secrets which those walls could have told none will ever know.

On the 16th of the same month an order was issued by the deputies of the people for the immediate demolition of the Bastille, which order, together with many other papers relative to the great state prison, can be seen to-day at the Musée des Archives. The outline of the building still remains clearly marked on the stones of the wide Place de la Bastille, where the column to Liberty stands.

The narrow street of St. Antoine has disappeared, with its quaint shops and their quaint names—"Pâtisserie de la Pomponnette," "Au

LOUIS XVI. (FROM A PRINT.)

bon Diable," "Au fichu de Marie Antoinette," and many others. And the swinging lamps are gone which hung from ropes fastened across the street from side to side; and the women knitting, "counting the stitches as later they would count heads falling on the Place de la Révolution." No shadow darkens the Place from the tall slender column which has taken the place of the prison with the towers.

A perfect model of the Bastille, made from one of the stones of the building, stands in one of the great rooms of the old Hôtel Soubise. Around it hang twenty-seven of the prison keys: another of these keys was sent by Lafayette as a present to Washington, and now hangs in the hall at Mount Vernon.

The capture of the Bastille was only the beginning of the end for the principal characters of the French Revolution. The *via dolorosa* which was to be trodden by so many innocent feet and which led at last to the guillotine had not yet been entered upon; *la guillotine* had not yet been invented; the gamins of Paris could not yet chaff one another about "Fin de la soupe," "La dernière Bouchée," or "La Mère au Ciel," all of which names they gave to Dr. Guillotin's life-destroying invention, about which he writes a letter that is in the Archives collection.

Not the least of Marie Antoinette's trials must have been her husband—a good, kind,

THE DAUPHIN.
(FROM A MINIATURE IN POSSESSION OF MRS. EDWARD VERY.)

amiable gentleman, who was never intended by nature for a king. To her, the proud daughter of the lion-hearted Maria Theresa, the "king" for whom the nobles of Hungary enthusiastically swore to die, it was inexplicable that Louis XVI. should give in step by step, yield privilege after privilege, without a murmur. Oh for the day of *le roi soleil*, with his famous words, "*L'état c'est moi!*" Oh for a king who could be king in more than name! But the descendant of St. Louis wrote tranquil entries in the journal in that delicate handwriting of his, filling at the same time the collection now at the Archives with documents which laid low one by one the bulwarks of his throne. Then came October, and the frightful days of the 5th and 6th at Versailles, when Lafayette found himself powerless to control the people, and the fishwomen of Paris went to the royal château to insult the *Autrichienne*, and in triumph escorted the weak king and his hapless queen and frightened children back to the capital.

A paper at the Archives tells us that the formidable *dames de la halle* were so pleased with themselves after this exhibition of patriotism, that they sent an address to the National Assembly, which that august body answered by an invitation to assist at one of its sittings,

proving by their response that they had a wholesome fear of the political zeal of the *poissardes*.

There is a letter at the Musée addressed to Louis XVI. by Roederer, a deputy to the Assembly, suggesting that he forget the occurrences of June 20 and unite his interests with those of the people in view of a foreign war, which the king consented to do. It seemed as if there was scarcely any concession which he was not willing to make. But the shadow had fallen too deeply on St. Antoine in earlier days to be forgotten, and the faubourg marched with cannon upon the Tuileries; the place was no longer safe, and the royal family took refuge in the building where the National Assembly held its sittings. A marble slab in the Rue de Rivoli of to-day marks the spot. Three hot August days were spent in a stifling *loge* at the back of the hall, and while the decree was pronounced suspending Louis XVI. as king, the poor little dauphin, too young to understand the significance of what was occurring, mourned the loss of his pet dog Moufflet, killed in the general massacre at the Tuileries.

Soon followed the decree transferring the unhappy family to the Temple, where for a while they were allowed to be together. They were still together when the massacres in the prisons took place, where the young and beautiful Princesse de Lamballe was murdered. It needed the imagination of fiends to devise the details of this victim's death, and no pen could calmly write them. After cutting off the head, the body was left to foul desecration, and forcing a wigmaker to wash the bloodstains from the poor dead face, and brush and curl and perfume the soft, fair hair, the people placed their trophy on a pike and paraded it through the streets of Paris.

"Suppose the Lamballe says good-morning to Antoinette?" cried a voice in the crowd; and the brutal proposition was hailed with delight.

The royal family were assembled in the queen's bedroom at the Temple when suddenly they heard a tumultuous shouting in the garden below, the queen's name being loudly

called. One of the soldiers left to guard the prisoners, knowing what ghastly thing it was which was to be held up at the window, and touched with pity, rushed in to save them from the shock; but he was too late. He found Marie Antoinette fainting in the arms of Mme. Elizabeth, the frightened children clinging to her, and the king standing spellbound by the horror of the sight which was before him.

Louis XVI. being removed to a separate apartment of the Temple, even the sad comfort of suffering together was taken away. Royalty had for some time been abolished; the Republic, one and inseparable, had been proclaimed; the National Assembly had become the National Convention, and *Liberté, Égalité, Fraternité*, the nation's watchword. Liberty for all but Louis Capet and his family. In December of 1792 we find a letter from M. de Malesherbes to the president of the Convention, offering to defend Louis XVI., if the people will allow him a defender at his trial; and soon after this his defense was presented to the Convention by M. de Sèze, assisted by De Malesherbes and De Tronchet, and signed by all. The tomb of M. de Sèze, in the great cemetery of Père la Chaise at Paris, bears the inscription, *Défenseur du Roi*.

On January 20, 1793, the executioner Sanson writes for directions for conducting Louis to the place of execution, and on the following day, at twenty-two minutes past ten in the morning, the king steps upon the fatal scaffold as the Abbé Edgeworth exclaims, "Fils de St. Louis, montez au ciel!"

The celebrated *acte d'accusation* was read to Marie Antoinette by Fouquier-Tinville at her so-called trial on October 14, 1793, and the queen of France, we are told, answered all the charges with heroic serenity. But when the infamous Hébert brought the frightful calumnies prepared in the Temple and signed by the terrified, half-intoxicated child, who had been forced to drink, and by his sister, who did not understand the meaning of the words, Marie Antoinette preserved a dull silence. When questioned as to what she had to answer to the charge, she still did not speak, a fact to which one of the jury drew the president's attention. Then it was that the tortured woman gave the memorable reply which thrilled all who heard it: "If I have not answered, it is

MME. DE LAMBALLE. (FROM A PRINT PUBLISHED BY FURNE.)

because nature refuses to answer such a charge made to a mother. I appeal to all mothers who may hear me."

This appeal actually penetrated the blood-soaked brains of those around her, and so struck the imagination of Robespierre that when the details of the trial were brought to him as he sat at a café in the Palais Royal, he shivered the plate before him as he exclaimed, "*Sacré imbécile d'Hébert!*" understanding too well that this latest insult to the queen had passed the bounds of prudence and must inevitably arouse sympathy for her. The widow of Capet had at this time been removed from the Temple to the Conciergerie, where in her narrow prison cell two guards watched her day and night. The end was drawing very near.

At half-past four in the morning of the day that she was to die, Marie Antoinette wrote the letter found on the preceding page to Mme. Elizabeth, who was still in the Temple. The signature cannot be seen.

She mounted the guillotine, the hundred and fiftieth victim of the Revolution, her crime being the fact that she was the daughter of an empress, the wife and mother of a king. And right royally she died; they had not the sat-

LOUIS CHARLES CADET

AUTOGRAPH OF LOUIS CHARLES CADET.

isfaction of seeing a moment's weakness, a single quiver of fear.

I have held in my hand the actual original order, written over a hundred years ago, for the execution of Marie Antoinette, dated half-past four o'clock in the morning of the 16th of October, the very hour at which the queen wrote her letter to Mme. Elizabeth. The order is addressed to the Citoyen Henriot, "Commandant-Général de la force armée Parisienne."

The signature of David the painter, become deputy of the city of Paris to the National Convention, is found attached to the judgment condemning the Girondists to death; as it is to an endless number of revolutionary papers. The man seemed to revel in infamy. As court painter he had received many favors from the royal family, yet he persecuted them with an implacable hatred. When sent with others to interrogate Mme. Elizabeth in the Temple, that princess welcomed him as a friend, and courteously asked him to give her a pinch of snuff from his box, as she had a bad cold. "Learn," he answered insolently, "that you are not worthy to put your fingers into my snuff-box"; and placing a little of the tobacco in his hand he familiarly offered it to the sister of his king. She quietly turned her back upon him. From a window in the Rue St. Honoré David made a pen and ink sketch of the unhappy Marie Antoinette as the terrible procession passed which escorted her to her death, and a chron-

icler of the times says that in drawing it "hate guided his hand." But for the fall of Robespierre his own turn would have come to taste death by the guillotine, but he was included in the amnesty of the fourth *brumaire*, and under Napoleon became painter to the government.

There are letters and signatures at the Hôtel Soubise of Mirabeau, that "monster of eloquence"; of Buonaparte before he had changed his signature to Napoleon; of Camille Desmoulins; of Carnot, ancestor of the present President of the French Republic; of Mme. du Barry, Alexander Beauharnais, Cardinal de Rohan, Thomas Paine, Madame de Staël, and many others too numerous to mention. There is also the treaty between France and the United States, of which James Monroe and Livingston were the signers on the part of the Americans.

Eyes tired of reading puzzling handwritings can rest themselves by looking at the beautiful pictures of Boucher, and examining the curious painting of the "Ship of Salvation"; and he who goes once to the Musée des Archives will probably return for a second visit to the old hôtel, with its open court inclosed by high stone walls, and its fine façade, wide staircase, and noble rooms; but well worth seeing as all these are, it is the marvelously interesting collection of papers, yellow with time and weighty with the import of the words written upon them, which will draw him back once and again to this delightful corner of Old Paris.

Elizabeth Balch.

THE RECONSTRUCTION OF THE BASTILLE ON THE AVENUE SUFFREN.

"THE REALM OF CONGO."

—*Paradise Lost.*

I.—MY TRIP TO THE CONGO.

BY THE COMMISSIONER OF THE UNITED STATES.

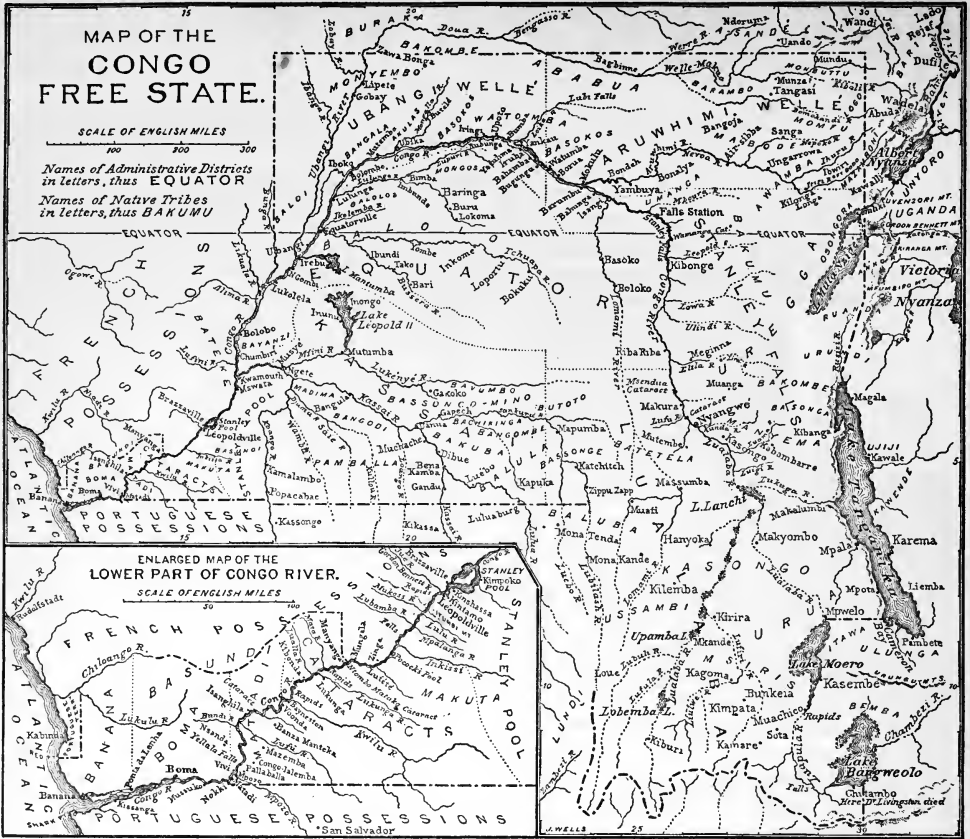

IN April, 1884, Congress passed an act recognizing the International Association for the proposed Congo Free State, and authorized the President of the United States to appoint a commissioner to make a survey of the country, and report to the Government on the possibility of trade between the United States and the Congo Valley. Mr. Frelinghuysen, then Secretary of State, tendered me the appointment, which I accepted. On the seventh day of September I sailed from New York for my post of duty. Arriving in Brussels I was received most courteously by the King of the Belgians. His Majesty gave me a most interesting account of his connection with the proposed Free State, the object which he hoped to attain, and the results already accomplished, demonstrating clearly that his work was one of philanthropy, and one which in the end he hoped and expected would yield good results in a commercial point of view, not only to Belgium, but to the whole commercial world.

After some telegraphic correspondence with my own Government, I was directed to delay my departure for the Congo and go to Berlin, for the purpose of conferring with Mr. Kasson, the American plenipotentiary, who had been designated to represent the United States in the Berlin conference, which conference had been summoned to settle once and for all the intricate questions which were almost daily arising between France, Portugal, and Belgium as to the boundary of the proposed Free State.

When the conference had got well under way I found that I was losing a great deal of time, and after communicating with the Secretary of State I received authority to leave Europe and go on my mission. I started from Berlin in November, went down through Spain and Portugal, and sailed from Lisbon, touching at Madeira and the Canary Islands; thence to the coast of Upper Guinea at Bissagos; from there I went to Prince's Island and St. Thomas, and thence to the Congo.

As we approach the mouth of the Congo coming from the north, and long before we sight the land, the discolored water and the floating leaves, sticks, and grass tell us that we are within the radius of the sea which is affected by the flow of that mighty river. Nearer and nearer we approach the coast, and gradually there appear above the horizon the low white buildings of Banana, then the clay cliffs to the north, and finally the sand spit which extends far out into the sea, forming a natural and safe harbor for the largest vessels. As we rounded the point the current grew stronger and stronger. If a vessel enters the Congo with a flood tide she will experience a choppy sea, caused by current against tide, which will cause a vessel of ordinary size to roll quite as much as when in a stiff gale far out in the ocean.

Banana possesses a motley population of about six hundred negroes; some are native slaves, some Kabindas and Loangos, while not a few are from the Krumanos of Sierra Leone and lower Liberia. The white population at the time of my visit consisted of about thirty Europeans, the managers and employees of the different trading companies whose factories are located at this point. The approach to Banana is really very beautiful and picturesque; washed on one side by the sea, and on the other by the dark waters of the Congo, which flows with merciless rapidity as if eager to escape from the barren and desolate country through which it has made its way from the placid Stanley Pool several hundred miles inland, and lashing itself into fury and foam over the many cataracts. The long row of buildings belonging to the Dutch trading company, the many small vessels moored within the harbor, and the workmen busy in the preparation of native products for shipment, gave evidence of the prosperity of the place; while in the background and on the low marshy border of the river the mango forest and the dense impenetrable jungle, the rank undergrowth matted together with vines and creepers, afforded fine effects of light and shade. Why this place should be called Banana I cannot conceive; certainly not from the fruit, for a banana tree was never known here until cultivated by the

traders. For more than two hundred years Banana has been in the possession of the Dutch traders, having been first occupied in 1670 by the Dutch East India Company as a supply station for their vessels to and from the East; and although the Dutch East India Company has passed out of existence, this station still remains the principal one in the hands of the Dutch African traders. There is now in possession of the Dutch Company a letter descriptive of Banana and the lower Congo, written more than two hundred years ago, and which if reproduced to-day would show little or no progress in this long lapse of time; so it is fair to infer that had it been as rich as is now claimed, the country certainly must have progressed with those of other lands in like latitudes. Banana has grown to its present importance by reason of its good harbor, which is the only one on the entire coast.

The Congo River is navigable for the largest ocean steamer to Boma, a distance of seventy miles from the sea.¹ Approaching Vivi and the falls of Yellala the current is very rapid, rocks are numerous, and dangerous whirlpools are constantly forming and changing position, tossing a steamer about as though

in a heavy sea, thus rendering it unsafe for any except powerful steamers of light draught. Particularly is this so in the rainy season, when the river becomes swollen, rising often from ten to twenty feet in as many hours. At Vivi the river is about one mile wide, but as one approaches the sea it ranges from two to five miles in width, reaching a depth in places of two hundred fathoms. Below Boma the banks or shores on each side are covered with dense forests of hard wood.

Boma has long been known as the principal slave-trading station on the lower Congo River, and in years gone by hundreds of thousands of slaves have been corralled at this point for sale and shipment to foreign countries. Happily this traffic has now ceased to exist so far as export to the outside world is concerned, but the trade in slaves is still largely carried on among the people of the country.

Dr. Ralph Leslie, the chief surgeon attached to the staff of the Governor-General, was my only white companion, but he did not continue long with me.

¹ The largest steamers now go to Matadi, situated just below the first rapids, 120 miles from the sea.—EDITOR.

Before starting up the country I was supplied with a quantity of goods, principally red cotton handkerchiefs, which were used as money along the first stage of my travel, about a hundred miles. Then I came to the country where blue glass beads are used; then came the white beads, and next came brass rods, which are used for making bracelets and anklets, the latter often weighing thirty or forty pounds, and being worn only by women. My caravan was made up of eighty negroes, each one carrying upon his head a load of cloth, provisions, medicines, luggage, tents, or cooking-utensils, the average weight of each load being seventy pounds.

Everything being in readiness, we were ferried over the river, landing at Mpozo, a station just at the foot of the Yellala cataract. I sent my caravan off early in the morning, that they could take all the time they wanted to reach the village of Pallaballa. We arrived at Pallaballa, a village of about four or five thousand people, about sundown. It was the first Congo village of any importance which I had seen.

When we came into Pallaballa we learned that the king—who was absent at the time—had instructed his son not to allow any white men to stop in the place before his return. He had gone to pay tribute to the king of San Salvador, from whom he had received a letter. I saw the letter, which was written in Portuguese, undoubtedly by a Jesuit priest. The king's son said we could not stop in the village. I was annoyed to think that I could not stay in the place overnight, so I called my interpreter, and told him to say to the king's son that I would be glad if he would allow me to stay there; and if he did so, without molesting me, I would give him a handsome present in the morning. He said no, I could not stop there; we would have to go on. But we were very tired, there was no water outside of the village, and we decided to stay whether or no. In most of the villages near the river where whites have appeared, the kings, as a rule, set apart a little hut which they give to traders who happen to come into the village, allow them to sleep at night in the hut, and then take something in the way of presents from them in the morning. I informed the king's son that if they allowed us to stop I would give them presents in the morning, but if they made us trouble we would burn their village. We were permitted to "turn in" without molestation, but about one or two o'clock in the morning the chief of Pallaballa himself put in an appearance. He had made the trip from San Salvador, some seventy-five miles or more, in three or four days; but he had been drinking with kings on the way, and was very drunk. He wanted to drive us out

of the place. But he was very easy to handle; a little trade gin soon put him to sleep, and we were not molested. In the morning we got ready to start, when Pallaballa and all his ministers put in an appearance and wanted their presents. I gave Pallaballa some handkerchief stuff, a red cotton umbrella, a bottle of gin, and a string of beads. Then I gave all his ministers a drink of gin, and they were very happy.

The chief began to tell me what a good friend he was to the white people, and he wanted to show me a treaty which he had made with Stanley when he passed through the country the last time. He went into his old hut and brought out the king's box. He had it tied round and round with strips from the bark of the palm tree. The old fellow opened the box and handed me the treaty—as he supposed. I found it to be a letter written in the Portuguese language, purporting to come from the king of San Salvador. This letter went on to compliment Pallaballa, and wish him every success in the world, and suggested to him that he should keep the white men out of his country; and after advising him what to do, it wished him well, and hoped he would not forget to send three or four bottles of gin. I said: "Old man, you have made a mistake. This is not the Stanley treaty; this is from Salvador." The old fellow was very much excited, and grabbed the document away from me. He then handed me another document, which was a treaty that he had signed with Stanley a long time ago, and bore date of Stanley's last passage through the country. After I had satisfied myself that the old man was friendly to us, I asked him to tell me why he was opposed to the white men stopping in his town overnight. He said: "I will tell you. We have not had any rain up here for a long time." And he went on to tell me that the palm tree would not yield *malafu*,—a fermented drink,—the ground nuts were not growing, and they were afraid of a famine, and he knew that the white men down the river at the camp had kept the rain back, and he believed that if he punished the white men as they came along the rain would come.

I went on to a town called Congolalemba, where the first water beyond Pallaballa was to be found, and to which village I had sent my cooks with all the paraphernalia for preparing breakfast. When I arrived at Congolalemba, as is the custom of the country, I had to send into the village to get permission from the chief to stop there overnight. As a rule, when I could not get a permit, I would camp outside; but wherever there was a village in which we knew there was water, we would stop. At the same time it was prefer-

able to keep away from villages, because the Houssamen whom I had were very much feared by the people, as they were great thieves, and invariably got us into trouble at every town we went to. When I came to Congolalemba, however, the king, who was a very pleasant fellow, seemed to receive me very cordially, and asked for a palaver, or council. The king and his ministers took seats on the ground. He said I was welcome to stay in his place. But while we were talking I noticed a great activity among his men, and I told my interpreter to go to some of the people and find out what was the matter. He came back and told me they were going down to fight Pallaballa. Before going to war in those countries they give notice that they will attack the next day. They never make an attack unawares. They were going to march that night and attack Pallaballa the next morning. I asked the king why he was going to fight Pallaballa, and he said the sap had run dry in the palm trees, and the ground nuts would not grow, and Pallaballa had kept the rain back.

Congolalemba began his march on Pallaballa, but during the night there came one of the most violent storms they had ever had in the country. The warriors passed the entire night in the rain, and when daylight came they did not want to fight. They made up their minds that Pallaballa, knowing they were coming, had relented, and so they went on to Pallaballa's village, got drunk, and had a glorious time for several days.

The afternoon of the third day we came upon a very beautiful camping place on a rocky river, but there was very little water in the pools formed in the rocks. About midnight a couple of Houssamen who were used as couriers came to this camp with a message from Major Vetch, who was at a place called Bayneston, dangerously ill,¹ and Dr. Leslie, who had been detailed to look after me, was summoned to save his life, if possible. Leslie talked the matter over with me, and I said: "By all means, go. I am perfectly well. I am an old traveler in the tropics. I have been through the Amazon country, had yellow fever, and various other fevers. If possible, go and save the man's life." We had had a hard day's march the day before, and Leslie had much to do. Every caravan man who fell ill would go to him, no matter what ailed them, if only a blister on the foot. He would say something kind to them, give them a little medicine, and send them off in a happy state of mind. Leslie decided to start at daylight for Bayneston.

It was only when we came to part that I realized how completely alone I was in that desolate country; and when Leslie went off

over the hills in one direction and I in another you can imagine my feelings — a stranger to the country, surrounded by treacherous negroes, and going into a region about which I knew nothing. I would have given my life almost to have been back in a civilized country. After marching about fifteen miles, I resolved to make my camp, the sun being very hot. I was worried in mind; my men had been stealing as they went along through different villages, and I had been annoyed and harassed all along by kings coming to me and demanding indemnity. Suddenly I was stricken down with fever, and fell heavily upon the ground, unable to help myself.

I called the caravan, told the men to set up my tent, get me a bed, and bring my medicine-chest. I had not a soul with me except the negroes, and even the most trusted ones were the greatest thieves, because they had a little more intelligence than the common mob through whose country I was passing. They surrounded my tent, and laughed at my efforts to doctor myself and at my attempts to make them understand me. My voice failed me; I could not speak. I called for water, which my Zanzibar men soon brought to me. In the mean time I got my medicine-chest and took out twenty grains of ipecac, divided it into two doses, and took them. In two or three minutes they had the desired effect, and my stomach was cleared. Then I ordered a pot of tea and drank it as hot as I could take it, covered myself with blankets, got into a perspiration, and kept that way all the afternoon. I had broken the fever. I passed a very bad night, in constant fear lest the natives might make an attack upon me, for they were a very cruel set. I gave the two or three kings who came to see me some presents, and they allowed me to remain the next day. But I found I was getting weaker instead of better. I had no nourishing food. My provisions had been sent on by another caravan route to join me at Banza Manteka. I made up my mind that if I tarried in this particular spot I certainly should die. So I determined to go on to the station of Banza Manteka, where I arrived after two days' march, completely broken down. I was most kindly received by Lieutenant Müller, who was in charge of the station, and after two or three days' rest was quite myself again.

From this place Müller accompanied me to Massamba, Lukunga, and Manyanga, and as we were to pass through the valley of Banza Manteka, a famous elephant-grazing ground, Mr. Müller arranged for a day of elephant hunting. We sent out a native to search for the trail, who came back in a few hours, informing us that he had found one. I had with me a

¹ Major Vetch died in 1887, at Lagos.—EDITOR.

large elephant-rifle, a smaller rifle, and a shotgun, with men to carry them, and with the chief of the station we set out to surround the elephants. We came upon a little clump of bushes, where a part of my caravan had been sent in order to keep track of the elephants, and they told us "the woods were full of them." They have not many woods there, but we could see the tops of the small trees coming down, and we knew that there were elephants feeding

ears sticking out straight, and off they went through the trees and tall grass. Shortly before that Lieutenant Müller had shot a very large elephant. The two tusks taken from him weighed 126 pounds each, and were six feet long. They were several hours in cutting the tusks out of his head, for the elephant's tusks are planted in the bony part of the head so deep that it requires a heavy ax and a great deal of cutting to get them out.

ELEPHANTS' FEEDING-GROUND.

upon them. Lieutenant Müller and I made a raid upon the elephants, taking up our positions so that the men could drive them from the north. We were in the south, where their trail had been marked, and lay in the grass waiting for them to pass by. In a short time they came along. There were fifteen of them, and Jumbo was not a circumstance to some of them. They looked to me, as I knelt there in the grass, like the great brown weather-beaten barns we see in America. I had been studying a book which I had with me, giving instructions how to shoot elephants. In my mind I had measured an elephant's ear, and I knew if I could hit him where the ear-flap went back on the shoulder he was dead. I was bound to shoot an elephant. I got my gun ready, and as the elephants came within about thirty feet of us I took aim; but my gun trembled so that I could not shoot, and Lieutenant Müller said: "For God's sake, don't shoot! The elephants will kill us both." I said: "There is no danger; I won't shoot." Neither did I shoot.

We made a very happy escape from the elephants. They soon got our scent, raised their trunks, tooted as no locomotive could toot, their

I was going down a hill one day ahead of my caravan, when I met, in a little bend of the path, a monstrous elephant. I had no gun with me. The elephant was coming leisurely up a long clay hill; he turned and went down the hill, perhaps three or four hundred feet, sliding as one sees a horse slide along on a slippery pavement, and tooting his trumpet as though in great fright. He got into the valley and disappeared in a very short time.

About five o'clock one evening I came upon the Lufu River. The caravan had arrived ahead of me and was afraid to cross, as the river was high, and there were a great many crocodiles in those parts. I started the men to taking over the loads. They were greatly frightened, but made all sorts of noises, and threw stones and sticks into the river, that they might frighten the crocodiles away, and soon the caravan got over. I had no wish to get across by fording, so I went down the river about a mile, and crossed where Stanley had made a bridge by tying together the vines of overhanging trees, upon which one could go over by walking on a latticed footway and holding on to swinging vines. Every one who

had crossed this river from time to time had added to the strength of the bridge by tying new vines to the main support, so that it was twisted into a cable larger than my arm. Again I had no gun. As I got to the center of this river, hanging on to help myself over, I heard right under me a great splash in the water and felt spray. I looked down, and there was a great elephant bathing, filling his trunk with water and splashing it over himself at a great rate. I made a noise, and he went up the river bank into the brush, and I lost sight of him.

Two days later we arrived at Lukunga, where I was kindly received, and entertained

Lutété's town I should turn back. I assured him that I would do as he had suggested. With that we went on, and as I kept going I took courage, for I knew it would never do for me to go back; and when I got to Lutété's town I told the doctor that I would go on. A message overtook him that night saying that Sir Francis de Winton¹ had fallen ill, and suggesting that he should return and bring me back with him; but I would not go back. Lieutenant Burns, a fine young English officer, was detailed to accompany me then, and I found him a very pleasant companion. We started on for Stanley Pool and I kept getting better, so that when I arrived at Leopoldville

A NATIVE DANCE.

by the chief of the station. Here I again had a serious attack of the fever. The day after, Dr. Leslie arrived. He had saved the life of Major Vetch, and hearing from passing caravan men that I was ill, he had followed on my track and overtaken me. The doctor insisted that I must go back; that it was not safe for me to keep on. I said, "Well, Leslie, I will see to-morrow how I feel." He poured quinine into me the next day, and soon I felt better. He insisted then that I must go back, but I insisted upon trying it for two or three days more. So I rested another day, and he agreed to go with me to Lutété's country, a little more than half way from the mouth of the river to Stanley Pool, with the understanding that if I was not better upon my arrival at

I was in very good condition, but poor Burns was dead.

I will pass over many interesting incidents, describing, however, a native dance which occurred at Lutété the evening of my arrival. A caravan had arrived from Ambriz with gin, powder, guns, and some cloths and beads, and the villagers were having a great jollification. I went over with one or two of my friends upon the invitation of King Lutété. Lutété told his son to clear a place for the white men, and he took a stick, went at the natives, and cleared a place so that we could see the negroes dance. The dances were participated in by men, women, and children, some of them babes hardly able to walk, but

¹ Then Governor-General.—EDITOR.

A NEGRO TOWN ON THE LOWER CONGO.

joining in as naturally and happily as though they had been in the business for years. They kept up the dance for a long time. I told the king that I was much obliged to him, and that we would go back to our camp; that I had to start early in the morning, as I was going through a country where there was no water. He said he wanted me to go to his house, a grass and bamboo hut about ten feet square; that he wanted to give me something. I went down to his hut, and he went inside and brought out a corkscrew, a bottle of brandy,—which he had just received from a trader down on the coast,—and a tumbler. Evidently he had been instructed in the use of the corkscrew, for he took hold of the bottle, turned the corkscrew and drew out the cork with a pop, and wanted me to take a drink, first putting the bottle to his mouth and taking a drink himself to convince me it was not poison. I took a drink with him, and he then rinsed out the tumbler, going through the operation with great neatness. He told me that he had seen this liquor and had tasted it on his trip down the country, and that he had sent down by one of the men in charge of his caravan for some of the white man's malafu; and the trader, in order to curry favor with Lutété, sent up a bottle of brandy, a glass, and a corkscrew.

There is nothing at all in the Congo, as far as I could observe, except in the river valleys, and then only in certain seasons of the year, which would give support to any considerable number of people if they were dependent upon the cultivation of the soil for what

they received. There are no trees except on the banks of the river, and then in isolated cases. But there is nothing at all in the valley of the Congo wherein I traveled which one could describe as a forest in any particular, except below Boma. While one does find some large trees, they are few, and principally mangroves. There are occasionally some hard woods, but very few. Nothing indicates that there ever has been a growth of timber. In the first place the soil is not of sufficient depth or richness to produce timber, or even to produce anything. About the only thing which grows along the valley is wild grass, sometimes ten, twelve, fifteen, and even twenty feet high; and throughout the whole country are zigzag paths made by the natives and utilized by the caravans. There are no regular roads, nor is there a line which can be followed with safety by a traveler.

The women do the work of garden making and marketing, while the men roam listlessly about, with no apparent object in view.

There is nothing about the natives of the Congo region to convince me that they have ever lived in a better condition than they do to-day. They are as low as the lowest. They have no intelligence. They have no written language. I have seen in the lower region of Africa a chimpanzee with more intelligence than any negro I ever saw on the Congo. I saw one chimpanzee that had fallen into a trap and was brought down to the Dutch station at Banana. They called him Leonidas. As he grew they became strongly attached to him, and detailed

a slave boy to take care of him and instruct him. They made a little hut for him, and gave him a bunk much like a steerage berth in a steamship, and Leonidas would go in there and go to bed like a little man. He would sit at table and take his food like a native. I have

pleasant. We were just getting on the outer edge of the pool when suddenly there rose up great numbers of hippopotami all around our little canoe. I thought surely the end had come, because they are very dangerous animals. They do not care particularly to destroy one,

A CARAVAN.

seen him drink gin, smack his lips and slap his hand down as though he enjoyed it. He would give the boys a slap in the face if they annoyed him; and I noticed that the negroes esteemed him very highly. The natives say that the chimpanzee is very smart; that he can talk, but he knows enough not to talk, because, if he were to talk, the white man would catch him and sell him for a slave.

When I arrived at Stanley Pool I was very kindly received by the Association employees. I found the American flag hoisted over a little shanty which had been prepared for my convenience; and as I entered the station of Leopoldville they fired a salute from an old gun which had been taken up the Congo a long time ago from Banana station. The salute was given to the commissioner of the United States, the first agent from any country to the Congo.

Two or three days after my arrival in the large village where Ngalyema dwelt I wanted to go to Brazzaville, and I arranged with a lot of men to take me over in a canoe, a distance of ten or twelve miles. I went over and was well received by M. Chavanne, the great French explorer, with whom I remained one night. On my way back I had an experience with hippopotami which was not very

but simply to get him out of their way. They wanted to capsize the canoe. There seems to be a sort of partnership between the hippopotami and the crocodiles—the hippopotami to furnish food, and the crocodiles to eat it. I said to my interpreter, "I think they will get us." He looked at them, and said, "No, we will get away." He spoke to our men in their language, and they plied their paddles vigorously. Three of the hippopotami had come within ten feet of us, with their mouths wide open. But I saw we were gaining on them, and we got away safely.

Lieutenant Burns had remarked to me repeatedly that his trip up the Congo was doing him a great deal of good; he had been very ill down below, and was glad of this change; he kept well, and had a good appetite. In the morning of the day he was taken sick he seemed perfectly bright and fresh, and remarked how well he felt, and he had made up his mind then to go down the country with me and go home. About nine or ten o'clock, as we were marching along, he said to me, "I feel very badly." I said, "What is the matter with you, Lieutenant?" He replied, "I don't know. I have a bad pain here"; and he rubbed his knees and remarked, "I can't walk. I don't

know what is the matter." I said, "Let us rig up a hammock and carry you." "No," he said, "I don't think there is anything wrong. I don't like to go into Leopoldville in a hammock. An old African traveler to be carried in a hammock is hardly the thing." But he grew weary, and I insisted upon rigging up a hammock. It was about ten o'clock when we put him into it. I got him into Leopoldville, put him to bed, and gave him medicine as best I could. We had no doctors. That night at ten o'clock he died. It was one of the few cases that occur where the fever attacks people so violently and takes them off so soon. This was a case which appealed to my sympathy very directly, for this man was one of God's noblemen, and a delightful fellow-traveler, and I had to carry the sad news to his grief-stricken parents in Europe.

On my way down to the coast I arrived at Manyanga, and made up my mind to go through the rapids. I felt that I was getting weaker and weaker every day; that I had the seeds of this terrible fever in my system; and I realized the importance of getting down to the sea as fast as possible. It was a matter of twelve hours as against nine days, and I made up my mind to try the twelve hours; for I felt in my heart that if I had to march through the country at the rate of nineteen or twenty miles a day, I certainly should die. We set out in the morning at about seven o'clock. I had thirteen men, six paddlers on a side, and a Zanzibar as cockswain; then I had stowed away under the men's feet a number of my carriers, so that I could use them in case of any trouble, each having a gun. We struck the rapids of Manyanga half an hour after starting. My hair stood up straight, and I declare I never had such an experience in my life, and for all the money in the world I would not undertake it again. The strain upon the nervous system was so great that I was perfectly helpless many hours. We went a distance of eighty-four miles in twelve hours. Passing along, we neared the mission station of Baynes-ton, and came to a pool where the waters were placid. The glassy surface was almost unbearable. The sun's rays glaring upon it burned my face. We could look for miles below us and some miles above; it was so still that it seemed as if nothing in the world could agitate that water; and then at times there would come with a rush, like escaping steam, a whirlpool, rising at the stern of our little boat, and tossing us about in a frightful manner. Once it took us around five times, and the men had to pull with all their might to get out of the vortex. A whirlpool would appear at one place, die away, with nothing to mark the place except the ripple of the waters as they would go on and wash the sandy beach, and suddenly it would ap-

pear again, perhaps a quarter of a mile away, with the same terrible noise. Passing the whirlpools we went through the rapids of N'Goma, where Stanley lost his last white man. That was perhaps the most terrible ordeal we had to pass through. Going down we struck a rock. Luckily, my men just evenly balanced the boat, and a great wave lifted us over. About three o'clock in the afternoon I made up my mind that we could not pass the Isanghila rapid that night. In the first place, it was dark, and I thought I would have dinner, so we landed near Voonda station; but I found I had jumped from the frying-pan into the fire. As I went up on the beach, I found a white man named Stanhope; he wanted to know where we came from, who we were, and all about us. I told him that I was the American commissioner to Congo. He said, "You have come to a fine place. I am surrounded by five or six hundred men. My house was blown down by a hurricane a few nights ago." He had no shelter, no food, and the negroes were as thick as possible in the valley below him, and they were occasionally firing upon him, and had promised him a massacre during the night. Captain Säulez was with me. He was an African fighter, a man of good judgment, with a great deal of nerve; he at once took command of the forces. I walked with him out on the brow of the hill; we looked through our glass and saw the position of the natives. They were going about in the grass and closing in. We asked Mr. Stanhope what occasioned all this trouble, and he told us it was a matter of trade between the tribes over the river. But we found afterwards that the immediate cause was his having flogged the son of the king, who had stolen from him or committed some other offense. He gave him a hundred lashes and let him go home to his father.

In the first place I wanted something to eat. I therefore called for a couple of volunteers from my men who spoke the language of the country. Two of them volunteered to go and see the king. I instructed them what to say. They went down the valley, and were taken as prisoners to the king. I had instructed them to tell the king that they came from a powerful white man, the brother of Bula Matadi (Stanley), who wanted to trade with them; that he had nothing to do with the people of the country; that he had many presents, etc. The king was willing, provided we did not belong to the Voonda crowd; and in order to satisfy himself he kept my men prisoners until he could verify their statements. In the mean time his men kept drawing nearer and nearer, waiting for the king to order them to attack. I was inclined to take to the canoe with Mr. Stanhope, but there was a possibility

of their taking canoes and following us with poisoned spears, and a greater possibility of our men overturning the canoe in their excitement. So I thought it was better to treat with them. We made a little reconnaissance down the valley, and made fires to deceive them as to the number of our men. Finally in the night we held a palaver. I sent them presents, such as I had, and gave them a piece of paper with which they could go to a station several days' march away and draw what they wanted of beads, cloth, and brass rods. In that way I probably saved the life of Mr. Stanhope and his little band. I stopped that night with him, and the next morning started at the break of day, running many fierce rapids, and arrived safely at the station of Isanghila, from which place I marched through the Bundi valley, a country filled with serpents and all sorts of poisonous insects, and, after four days and a half, reached Vivi.

It will be impossible, except in general terms, to give a description of the country through which the Congo flows. Many travelers have as many different views, though all agree that the low land of fetid black muck and luxuriant vegetation between the sea-shore and the first high land, about one hundred miles inland, is a hotbed of fatal fevers, and that beyond Vivi, for a distance of more than six hundred miles, the climate is positively dangerous. No traveler is known to have escaped the terrible fevers of this pestilential country,

and lucky are they—and few there be—who live to tell the tale of their experience.

The low land near the coast north of the Congo contains hundreds of square miles of swamp and lagoons, covered with dense evergreen forest and underlying vegetation of most luxuriant growth, wherein abound the rubber and palm trees, the products of which are very profitable to the trader. South of the Congo, excepting the immediate bank of the river, and then only in isolated places, there is nothing of the profuse vegetation which we find to the north. No forest is found; nothing but vast stretches of rolling prairie land, with here and there slight rises of red clay cliffs which serve to break the monotony of an almost boundless unproductive territory.

At a distance of two hundred miles from the sea an elevation of about fifteen hundred feet is reached, where rank grasses of gigantic growth abound, not infrequently attaining a height of twelve and even twenty feet. There are no forests of any magnitude along the Congo until the interior is reached, though in the villages of the Lufu and the Inkissi there is some fine timber. It is claimed by travelers that the interior of the Congo Free State offers great inducements to the trader, and even to one disposed to become an actual settler. Upon this point I cannot coincide with any one who recommends the Congo country as a desirable place for residence.

W. P. Tisdell.

II.—THE CONGO RIVER OF TO-DAY.

BY ONE OF STANLEY'S FORMER OFFICERS.

SINCE Mr. Stanley's descent to the mouth of the Congo River, in 1878, after his perilous and adventurous voyage across the Dark Continent, very great changes have taken place in that part of Equatorial Africa. During his subsequent journeys to the Congo country his great energy and indomitable perseverance enabled him effectually to occupy that country and obtain rights over the land by concessions to the native chiefs, so that at the Berlin conference in 1885 he had the gratification of seeing this wild country proclaimed by the general assent of the great powers "The Congo Free State."

There are at present three regular European steamship lines running to the Congo—the Royal African Mail, from Liverpool; the German Mail, sailing out of Hamburg; but the quickest is the Portuguese Mail, leaving Lisbon

on the sixth day of each month, and arriving at Banana on the twenty-sixth of the same month. Besides these there are several steamships belonging to the large commercial houses trading on the west coast of Africa.

Banana Point, situated at the mouth of the Congo, has lost a great deal of its importance from the fact that the ocean-going steamers from Liverpool and Hamburg, loaded with merchandise for general trade, formerly discharged their cargo there, whereas now they proceed up to Boma and Matadi, as this stretch of water has been most ably surveyed and a course buoyed out by the Danish Captain Boye, in the service of the Congo Free State.

Boma, which is situated on the north bank of the river about seventy miles from the coast, is at present the seat of the government and residence of the governor. There are upwards of one hundred Belgians and foreigners (no English) holding official positions and assist-

ing in the administration of this vast territory of the Free State. A postal service is established, law courts exist, and a public force of Houssa soldiers are attached to the place. They have also several steam launches running between Banana and Matadi for the transport of men, mails, and merchandise.

Besides this extensive white population of government officials, there are also a large number of Europeans in the English, French, Dutch, and Portuguese commercial houses engaged in trading with the natives, exchanging rum, powder, guns, cloth, etc., for native products, such as palm oil, palm kernels, and peanuts, which are shipped home to Liverpool, Hamburg, or Havre, and there used in the manufacture of soap, candles, etc.

These commercial houses have to keep a large stock of merchandise of all kinds, as they are also supply dépôts for the numerous small trading houses, glimpses of the white roofs of which one sees dotted here and there in the low mangrove swamps on each side of the river from Banana to Matadi.

A Belgian company are engaged at present in building a large iron hotel at Boma for the accommodation principally of the State officials, and for the expected influx of Europeans attendant upon the building of the new Congo railway from Matadi to Stanley Pool.

Matadi, on the south bank of the river, sixty miles above Boma, is now the principal transport dépôt and despatch station. It is situated just below the first cataracts, which extend, with the exception of a stretch of eighty miles of navigable but turbid water, between Isanghila and Manyanga, a distance of 250 miles; so that from Matadi overland traveling has to be performed until navigable water is again reached at Stanley Pool.

There are now also at Matadi large establishments belonging to the principal English, French, Dutch, Belgian, and Portuguese trading companies, and a valuable trade in ivory, rubber, palm kernels, etc., is carried on, the ivory being brought down by the middlemen dwelling around the district of Manyanga, who obtain it from the Batéké traders of Stanley Pool.

On the Congo there are no beasts of burden, there existing merely a manual transport, the porters being the natives of the Bakongo tribe, inhabiting the cataract regions. In physique these men are slight and only poorly developed; but the fact of their carrying on their head from sixty to one hundred pounds' weight twenty miles a day for sometimes six consecutive days, their only food being each day a little manioc root, an ear or two of maize, or a handful of peanuts, pronounces them at once as men of singularly sound stamina. Small boys

of eight and nine years old are frequently met carrying loads of twenty-five pounds' weight.

Throughout the cataract region the general accepted money currency is Manchester cotton cloth made up into pieces of six yards each. The European cost of the cloth paid to these natives for transporting a load to Stanley Pool from Matadi, including rations, amounts at the present day to five dollars for a load of sixty-five pounds. Five years ago the cost was only one-third of this amount; but it has increased on account of the opposition of the various trading houses that have established stations at Stanley Pool for the ivory trade on the upper river.

A few years ago there were numerous villages on the line of march, but the traffic has increased to such an extent that the natives, in order to secure privacy and the entire products of their own plantations, have moved up the valleys, off the caravan road. This caravan journey through the cataract region is made in two stages, from Matadi to Manyanga, and from the latter place to Stanley Pool. Each native caravan, consisting of twenty-five or thirty men, is in charge of a head-man, who is responsible for the delivery of the loads to their destination.

The country between Matadi and Stanley Pool is exceedingly hilly, and it is only in the latter part of the road that stretches of plateau are found.

The so-called caravan road is merely a bridle path a few inches in width, the porters all being compelled to march in single file. The grass in the rainy season attains a height of from nine to fifteen feet, when progress is rendered extremely difficult. There are now established every ten or fifteen miles along the route little market places, where the caravans are met by the resident natives, who bring native produce,—bananas, manioc, peanuts, fowls, etc.,—which they exchange for cloth and beads with the porters. The more regular markets, which are gathering-places of hundreds of natives from the surrounding villages, are generally held some little distance off the caravan route, and take place every four days.

The manual transport has now assumed enormous proportions, the wants of the State, the commercial houses, and the missions necessitating the monthly transportation of upwards of five thousand loads.

The station of Leopoldville, built on a hillside, is situated on the lower end of Stanley Pool and commands an excellent view of the surrounding country. It is the central dépôt of the Congo Free State, whence supplies are forwarded to the stations on the upper river. There is at present a staff of about twenty-five

Europeans attached to this station, carpenters, engineers, captains of boats, in addition to administration officials. There are five large river steamers and two small ones.

This station was under the command of Lieutenant Liebrechts for a considerable time, and during his able management vast plantations of manioc, rice, maize, sweet potatoes, and peanuts were developed, rendering the station, with its garrison of four hundred blacks, now almost self-supporting. Kinshassa, also on the south bank, eight miles above Leopoldville, has assumed great importance, as the two largest commercial enterprises, the Dutch and Belgian, have selected this district as their base of operations for the ivory trade on the upper Congo.

The department for the trade in the interior by the Dutch African Trading Company is managed by Mr. A. Gresshoff, who has served fifteen years in this company, having entered it when he was fifteen years old. He is a young Dutchman of keen enterprise, and the development of this company's Central African trade is entirely due to his energy. Besides placing trading stations in the most advantageous position in the upper Congo, he has also a stern-wheel river steamer, the *Holland*, which is kept continually at work, dividing its time in supplying the different stations and making trading trips up the affluents of the river.

"La Société Anonyme Belge pour le Commerce du Haut Congo," a Belgian trading company, originated from a small exploring expedition which could scarcely be considered a success until taken in hand by Major W. G. Parminster, an Englishman who was at one time acting-administrator in the Congo Free State, and whose ability and perseverance have been the means of establishing this large Belgian company with a capital of upwards of 1,000,000 francs. It possesses at the present time, in addition to five well-stocked trading ports, four river steamers engaged in ivory buying.

Opposite Kinshassa is Brazzaville, the seat of administration of the French Congo territory, and the residence of the French resident; they also have five or six steamers running on the river. Close by this station Messrs. Dumas and Beraud, a French trading company, have their central dépôt. They have also a steamer which supplies their advanced stations on the upper river with provisions and with merchandise for the purchase of ivory. The lucrativeness of this trade is apparent from the several hundred tons of ivory

exported by these companies during the past two years.

The Congo Free State itself competes against these trading companies, and several tons of ivory are annually purchased by them from the natives and from the Arab slave raiders at Stanley Falls.

Owing to the explorations of Mr. Grenfell of the English Baptist mission, Lieutenant Wissmann, and Captain Van Gele, the geographical position and the courses of the many affluents of the Congo are now well known.

Lieutenant Wissmann descended the Kassai in 1885 from its head-waters, since which time Dr. Wolf and Mr. Grenfell have explored its different tributaries; and with the exception of the head-waters of the Ubangi, which were explored by Captain Van Gele, a Belgian officer in the service of the State, Mr. Grenfell has been the first man to ascend all the principal tributaries of the Congo. Being a man of scientific knowledge, he has carefully taken geographical observations during all his travels, thus rendering a great service to the geographical world by carefully mapping out the rivers he has explored, the course and positions of which were until then indefinite. Mr. Grenfell has received at the hands of the Royal Geographical Society at London a well-earned tribute, having been presented by them with their gold medal for the best exploring work done during the year.

Stanley Falls is at the present time the farthest point occupied by State officials.

The only product on the upper river profitable to export is ivory, owing to the costliness of the transport. All kinds of native products are to be found in large quantities in the interior,—rubber, copal gum, dyes, valuable woods, palm oils, palm kernels, peanuts, etc.,—and there are also portions of the country rich in copper and iron. Doubtless when the much-talked-of railway from Matadi to Stanley Pool is completed the exportation of other articles will be found profitable.

It is estimated that this stretch of railway will cost \$5,000,000, and it is to be completed in five years. A great deal of the plant for the enterprise is already at Matadi, and preliminary operations have begun.

The natives of Central Africa are continually having their wonder aroused by the innovations of the white men. The opera-glass, rifle, and steamboat have all played their part in exciting their wonderment, but the mysterious railway locomotive is yet in store for them.

EMERSON'S TALKS WITH A COLLEGE BOY.

WHILE still an undergraduate, my connection with certain lectures delivered by Mr. Emerson before the students of Williams College and elsewhere necessarily threw me much with him; and now

it is a youth's experience of him that I would give to youth.

Well do I remember his tender, shrewd, wise face as I first saw it. Almost before we were alone he made me forget in whose presence I stood. He was merely an old, quiet, modest gentleman, pressing me to a seat near him, and all at once talking about college matters, the new gymnasium, the Quarterly, and from these about books and reading and writing; and all as if he continually expected as much as he gave. And so it was ever after; no circumstances so varying but, whether I saw him alone or in the presence of others, there was the ever-ready welcome shining in his eyes, the same manifest gentleness and persistent preference of others.

One day, in my own room, glancing up at some "Laws of Writing" on the wall, he began abruptly:

"The most interesting writing is that which does not quite satisfy the reader. Try to leave a little thinking for him. That will be better for both. The trouble with most writers is, they spread too thin. The reader is as quick as they; has got there before and is ready and waiting. A little guessing does him no harm. So I would assist him with no connections. If *you* can see how the harness fits, he can. But make sure that you see it. Then when you have something new to say, say it! Out with it! Don't lead up to it! Don't try to let your hearer down from it. That is to be commonplace. Say it with all the grace and force you can, and stop. Be familiar only with good expressions.

"Expression is the main fight. Search unweariedly for that which is exact. Do not be dissuaded. Know words etymologically. Pull them apart, see how they are made; and use them only where they fit. Avoid the adjective. Let the noun do the work. The adjective introduces sound; gives an unexpected turn, and so often mars with an unintentional false note. Most fallacies are fallacies of language. Definitions save a deal of debate.

"Neither concern yourself about consistency.

The moment you putty and plaster your expressions to make them hang together you have begun a weakening process. Take it for granted that truths will harmonize; and as for the falsities and mistakes, they will speedily die of themselves. If you *must* be contradictory, let it be clean and sharp, as the two blades of scissors meet.

"Out of your own self should come your theme; and only thus can your genius be your friend. Eloquence, by which I mean a statement so luminous as to render all others unnecessary, is possible only on a self-originated subject.

"Don't run after ideas. Save and nourish them, and you will have all you should entertain. They will come fast enough and keep you busy.

"Reading is closely related to writing. While the mind is plastic there should be care as to its impressions. The new facts should come from nature, fresh, buoyant, inspiring, exact. Later in life, when there is less danger of imitating those traits of expression through which information has been received, facts may be gleaned from a wider field. But now keep close to realities. You then accustom yourself to getting facts at first hand. If we could get all our facts so, there would be no necessity for books; but they also give us facts, if we know how to use them. They are the granaries of thought as well.

"Read those men who were not lazy; who put themselves into contact with the realities. So you learn to look with your eyes, too. And do not forget the Persian, Parsee, and Hindu religious books; books of travel, too! And when you travel describe what you see. That will teach you what to see. Read those who wrote about facts from a new point of view. The atmosphere of such authors helps you even if the reasoning has been a mistake.

"And there is Darwin! I am glad to see him here. And you must read George Borrow's book about the Gipsies. He went among them, lived among them, and was a Gipsy himself. There is nothing from second sources, nor any empiricism in his book. You can rely upon everything, and it is quaintly told. From such as he you learn not to stop until you encounter the fact with your own hand.

"Avoid all second-hand borrowing books — 'Collections of —,' 'Beauties of —,' etc. I see you have some on your shelves. I would burn them. No one can select the beautiful pas-

sages of another for you. It is beautiful for him, well! Another thought: wedding your aspirations will be the thing of beauty to you. Do your own quarrying.

"Do not attempt to be a great reader; and read for facts, and not by the bookful.

"You must know about ownership in facts. What another sees and tells you is not yours, but his. If you had seen it, you would not have seen what he did, and even less what he tells. Your only relief is to find out all you can about it and look at it in all possible lights. Keep your eyes open and see all you can; and when you get the right man question him close. So learn to divine books, to *feel* those that you want without wasting much time over them. Often a chapter is enough. The glance reveals when the gaze obscures. Somewhere the author has hidden his message. Find it, and skip the paragraphs that do not talk to you."

Upon my pressing him for directions more particular and practical, a process which was rarely successful, he, after a moment's hesitation, continued as follows:

"Well, learn how to tell from the beginnings of the chapters and from glimpses of the sentences whether you need to read them entirely through. So, turn page after page, keeping the writer's thought before you, but not tarrying with him, until he has brought you to the thing you are in search of; then dwell with him, if so be he has what you want. But recollect you read only to start your own team.

"Newspapers have done much to abbreviate expression, and so to improve style. They are to occupy during your generation a large share of attention." (This was said nearly a quarter of a century ago. It was as if he saw ahead the blanket editions.) "And the most studious and engaged man can neglect them only at his cost. But have little to do with them. Learn how to get *their* best too, without their getting yours. Do not read them when the mind is creative. And do not read them thoroughly, column by column. Remember they are made for everybody, and don't try to get what is n't meant for you. The miscellany, for instance, should not receive your attention. There is a great secret in knowing what to keep out of the mind as well as what to put in. And even if you find yourself interested in the selections, you cannot use them, because the original source is not of reference. You can't quote from a newspaper. Like some insects, it died the day it was born. The genuine news is what you want, and practice quick searches for it. Give yourself only so many minutes for the paper. Then you will learn to avoid the premature reports and anticipations, and the stuff put in for people who have nothing to think.

"Reading long at one time in any book, no

matter how it fascinates, destroys thought as completely as the inflections forced by external causes. Do not permit this. Stop, if you find yourself becoming absorbed, at even the first paragraph. Keep yourself out and watch for your own impressions. This is one of the norms of thought. You will accumulate facts in proportion as you become a fact. Otherwise you will accumulate dreams. Information is nothing, but the man behind it.

"Yield not one inch to all the forces which conspire to make you an echo. That is the sin of dogmatism and creeds. Avoid them. They build a fence about the intellect.

"You are anxious about your career. I know without your telling me. Every college boy is. You think you can study out yourself what you are best fitted for? No. But you remember our séance with Professor — over in the chemical laboratory yesterday; how he took a substance and tried it with others, one after other, until he discovered the affinity? So a man finds, by trying, what he can do best. Each man and woman is born with an aptitude to do something impossible to any other.

"By working, doing for others simultaneously with the doing of your own work, you make the greatest gain. That is the generous giving or losing of your life which saves it. Don't put this aside until you are more at liberty. That is slow death. Have something practical on your hands, it makes small matter what, at once. If your disposition is right you will select well.

"Live in a clear and clean loyalty to your own affair. Do not let another's, no matter how attractive, tempt you away. So, true and surprising revelations come to you, and experiences resembling the manifestations of genius. There are so many who are content to be, without being anything. Opportunities approach only those who use them. Even thoughts cease by and by to visit the idle and" (after a pause) "the perverse. But sudden and unforeseen helps and continued encouragement are vouchsafed to the devout worker. For God is everywhere, having his will, and he cannot be baffled. Make his business yours, as did his son. The man who works with him is constantly assured of achievement.

"Be choice in your friendships. You can have but few, and the number will dwindle as you grow older. Select minds who are too strong and large to pretend to knowledge and resources they do not really possess. They address you sincerely."

About poetry he uttered the following suggestions, occasioned by the criticism of some Class Day rhymes:

"I suppose you read over your verses after they are written?"

"Generally."

"I suppose then, after a little, they grow old to you?"

"Indeed, they do."

"And you continue to write. If, after a long time, you look over any of your lines and you come to one or a succession and say to yourself, 'That is good,' it is good; but destroy everything from which this verdict must be withheld. The Me is the judge, after all. And if a thing seems good to me, it shall to my fellow. I can sympathize with the desire for outward confirmation. Still, the poet is his own assurance. Poetry,"—and here he lapsed into that manner of reverie as if all hearers were far away,—“whether it comes in dreams or in gleams is noble. It must serve no sordid uses. It is of the above.

"You must keep some fact-books for poetry. I think that they are much more nearly related to poetry than rhyme or rhythm. Study Greek for expression; but the poetic *fact* is half the battle. Nature, gathered in by the sensitive soul, forms the furniture of the poet.

"Did you ever think about the logic of stimulus? Nature supplies her own. It is astonishing what she will do, if you give her a chance. In how short a time will she revive the overtired brain! A breath under the apple tree, a siesta on the grass, a whiff of wind, an interval of retirement, and the balance and serenity are restored. A clean creature needs so little and responds so readily! There is something as miraculous as the Gospels in it. Later in life, society becomes a stimulus. Occasionally, the gentle excitation of a cup of tea is needed. A mind invents its own tonics, by which, without permanent injury, it makes rapid rallies and enjoys good moods. Conversation is an excitant, and the series of intoxications it creates is healthful. But tobacco, tobacco—what rude crowbar is that with which to pry into the delicate tissues of the brain!"

Years after, I met Mr. Emerson in the West and mentioned in the conversation a bit of exciting experience among the Tennessee mountains, which drew from him the following:

"What tonic can be more inspiriting and healthful than an adventure? It gives back to the blood all its youth."

At a meeting of one of our college debating societies, Mr. Emerson said:

"I was interested in your critic's report. But there are nine of you here; then there should be nine critics. It is possible that you associate a wrong meaning with this word. I observed that your critic noted such minutiae as that a certain word was pronounced wrong; that a plural verb followed a single nominative; that a gesture was made with the index finger instead of the open hand; that a speaker stood

with his feet six inches apart instead of two. So you regard the speeches as so many targets, and listen to pick flaws, to find faults and little inaccuracies. You gain something in marking these things alone, but you lose immensely more. Criticism should not imply to you such a watching out, for that begets hostility of thought, a closing of the mind to the natural impulses of the speech, lest it be influenced by them; and indulgence in the silent rehearsing of premature rejoinders. You are chiefly here, I take it, for the study of method, manner, style. Then you should project yourselves into sympathy with the speaker. Make certain that you receive his effort. Receive it all, and receive it well. Put yourself in his place. Try to see why he sees as he does; and then proceed outward to investigate his sentiments and their expression. Remember all criticism dealing with isolated points is superficial. The prevailing thought and disposition are your main care.

"Then, seek what is characteristic. Get the method of the man, the way in which he tries to develop and impress his idea. Attend closely to the *quality* of the matter presented. It is an index to the speaker's originality and culture, and therefore of his ability to impress others.

"When your attention is held without effort from yourself; when you are conscious of thoughtfulness, a change of opinion working within—then attend, attend! Your speaker has power. Overlook all fault, intonation, emphasis, pronunciation. Lay hold of his secret. The genuine impressions of a speech are the thoughts it immediately arouses, and these are the sources of true critical activity."

I do not think of Mr. Emerson as primarily a critic. His was not generally the posture indicated by the word. He was familiar with the laws that determine excellence of form, but sincerity and the satisfaction of the moral sense constituted his criterion. "The first and main attention of men to one another is to listen and be taught," he said, "and we are continually surprised at the riches of our fellows." His criticism was of that rarest order, creative rather than judicial; and his historical and biographical judgments have been affected only by the discovery of facts and perspective unknown to him. He always saw the good—a rare trait. It is easy to point out defects.

Mr. Emerson talked apparently without reservation to me about his contemporaries and historical personages. I select such of his delightful comment as seems distinguished for the consideration of "his noble young men," as he called them.

I remember one afternoon we were walking among the hills of Williamstown in the locality known as Bryant's Glen.

"Yonder is a serious mountain," said Mr. Emerson, pointing to Greylock. "I should think this would be just the place to read 'The Excursion.' The hills are very like those of Westmoreland. Here one can see the poet standing on the shore and looking off on the wide sea-light, and backward on the glows of the mountains, and then recognizing the inner supernal light, the subjective, as he framed that most famed combination :

"The light that never was, on sea or land,
The consecration, and the poet's dream.

"Wordsworth," he continued, "is the poet of England. I see 'The Reader' lately acknowledges it. He is the only one who comes up to high-water mark. Other writers have to affect what to him is natural. So they have what Arnold called *simplicity*, he, simplicity.

"The first three books of 'The Excursion' are the best. The discussions are uninteresting, but the adventures of the wonderful Peddler always charm me. There is sometimes an extreme even in Wordsworth. What is that 'horrible' line in 'Peter Bell'?"

"The hard, dry see-saw of his horrible bray!"

"The ass is unpoetical; and perhaps 'Alice Fell' is too childish, a little. His sonnets are good. They are, indeed, as pure, chaste, and transparent as Milton's. They are the witchery of language. He is the greatest poet since Milton."

Emerson could quote almost entirely "The Prelude" and "The Excursion," so much had he pondered them.

"There are no books for boys," he concluded, "like the poems of Sir Walter Scott. Every boy loves them if they are not put into his hands too late. 'Marmion,' 'The Lay of the Last Minstrel,' 'The Lady of the Lake'—they surpass everything for boy-reading we have."

It was uncommon to hear Mr. Emerson speak with such emphasis of any one as he did of Plato. At our first railroad restaurant, where, although there was plenty of time, everybody was eating as they do generally at travel-tables, Mr. Emerson leaned over towards me and said humorously, with a smile:

"Was n't it Plato who said of the citizens of Agrigentum,—they, you know, were colossal architects and eaters,—'These people build as if they were immortal; and eat as if they were to die instantly'?"

"Read Plato's 'Republic'! Read Plato's 'Republic'! Read Plato's 'Republic'!" he repeated, on another occasion. "He lifts man towards the divine, and I like it when I hear that a man reads Plato. I want to meet that man. For no man of self-conceit can go through Plato."

Carlyle, I believe, confesses that he cannot read Plato.

"I am glad you have so many of the Greek tragedies," continued Mr. Emerson. "Read them largely and swiftly in translation, to get their movement and flow; and then a little in the original every day. For the Greek is the fountain of language. The Latin has a definite shore-line. But the Greek is without bounds." Then after a pause he added, half to himself, "Dead languages, called dead because they can never die."

Of Gibbon he spoke strikingly as follows:

"He is one of the best readers that ever lived in England. You know his custom of examining himself both before and after his reading a book to see what had been added to his mental experience? All previous and contemporary British historians are barefooted friars in comparison with Gibbon. He was an admirable student, a tremendous worker. He banished himself to a lonely château just to work harder. But he thought uncleanly. He had—as also did Aristophanes, whom I never could read on that account—an imagination degraded and never assoiled, a low wit like that which defaces out-buildings. He was a disordered and coarse spirit, a mind without a shrine, but a great example of diligence and antidote to laziness.

"Locke was a stalwart thinker. He erected a school of philosophy, which limited everything to utility. But the soul has its own eyes, which are made illuminating by the spirit of God."

With the same lofty accent he spoke of Harriet Martineau, and compared her attitude with that of her brother.

"It was a grief to me when I learned that she had become a materialist." After a long pause he added, lifting his head, "God? It is all God."

"Read Chaucer," he said. "In a day you will get into his language, and then you will like him. Humor the lines a little, and they are full of music.

"I have seen an expurgated edition of Chaucer; shun it! Shun expurgated editions of any one, even of François Villon. They will be expurgating the Bible and Shakspeare next."

Of Shakspeare he talked much, and always without a word of subtraction. Of no one else did he speak in a similar strain of encomium excepting that imperial man, Walter Savage Landor.

"So far as we know," he said, "the 'Essays' of Montaigne is the only book Shakspeare owned. Like Aristophanes, Shakspeare had the care of the presentation of his plays. So they were kept practical. It has had much to do with their surviving.

"But Shakspeare was a wonder. He struck

twelve every time"; and then, after a pause, "We have not such creatures in America." Somehow the words, and his half-sad manner in uttering them, brought back to me old Nestor's lament:

For not any time have I seen such men, nor shall I as Perithous or Gyas, etc.

He spoke of the songs of Ben Jonson as "the finest in the English language. They are rich and succulent and metery. Few men have that wonderful power of rhyming, especially double-rhyming, that he has"; and he instanced "The Mask of Dædalus," and recited four stanzas of Jonson's ode to himself in illustration.

Of the author of "Noctes Ambrosianæ" he said:

"I liked him; not as Professor Wilson, but as Christopher North. He was a man singularly loved. Hare, author of 'Guesses at Truth,' wrote his life, but it was incomplete. Then Carlyle attempted it, but he wrote too much with the air of a patron, too much condescension, as a teacher might say, 'Fine boy!'—too much pat-him-on-the-head in it. I wrote Carlyle I would rather agree with Wilson than himself."

I was much interested in his words on Shelley and Blake. While he seemed hesitatingly to recognize and allow the wide gleams of truth the disciples of these mystics claim for them, he yet insisted that their visions were rather a curiosity than a discovery; and rebuked them strongly for their trait of "obliteration of the imagination" by natural objects.

"I cannot read Shelley with comfort," he said. "His visions are not in accord with the facts. They are not accurate. He soars to sink."

He quoted Blake's

Tiger! Tiger! burning bright,

over and over, almost the only thing I ever heard him quote that he put into the "Parnassus."

He many times referred to Leigh Hunt, and advised me to read him—"a true and gentle friend to all men."

Of Matthew Arnold he said: "He is stored with all critical faculties except humor, but so far he shows little of that." And of Browning: "He is always a teacher."

"Have you read any of Goethe?" he asked.

On my replying affirmatively as to "Wilhelm Meister," he said:

"Ah, yes, that is good. It wants to be read well. It contains the analysis of life. Wasson in 'The Atlantic' some time ago had some excellent words upon it, more a panegyric than a criticism. But Wasson must have just come to it. We have loved Meister a long time."

VOL. XXXIX.—87.

Of Fichte he said: "He would use any weapon to convert a hearer. I think he would trepan a person, if so he could pass his own edacious conception into the bared brain."

I once asked his opinion of the novels of George Sand, and he answered as follows:

"It is wonderful, the amount she has written—everything; she seems to know the world. But her stories—I do not know about them. I do not read stories. I never could turn a dozen pages in 'Don Quixote' or Dickens without a yawn. Why read novels? We meet stranger creatures than their heroes. What writer of stories would not be derided if he gave us creatures as impossible as Nero or Alva or Joan of Arc?"

Again, referring to a poet then rather the fashion: "Melancholy is unendurable. Grief is abnormal. Victor Hugo has written such a book. I have not read it. I do not read the sad in literature."

These words were the first seismic tremors in my new heavens and new earth. They set my wits a-swimming, troubled me with apprehension of possible limitation in him. So the next day, with a youth's temerity, I told Mr. Emerson of my inability to accept his statements on this matter as I understood them. He heard me patiently, watched my quivering lips a moment, and then said briefly but with a beaming glance:

"Very well; I do not like disciples." This remarkable reply illustrates Mr. Emerson's peculiar and wholesome ways with lovers, emancipating them even from himself. From this time disappeared from his pupil the boyish and servile acquiescence, and I doubt not from the master the feeling of nausea it could not but cause. The release saved me my friend and made of his friendship the greater blessing.

Of cisococeanic contemporaries, Mr. Emerson spoke as follows:

"The connecting link between England and America is Oliver Wendell Holmes. If that acute-minded man had been born in England they would never have tired of making much of him. He has the finest sensibility, and that catholicity of taste without which no large and generous nature can be developed. Everything interests him.

"'Leaves of Grass,' by Walt Whitman, is a book you must certainly read. It is wonderful. I had great hopes of Whitman until he became Bohemian. He contrasts with Poe, who had an uncommon facility for rhyme, a happy jingle. Poe might have become much had he been capable of self-direction."

He spoke of Daniel Webster as "deformed. He became to me the type of decay. To gain his ambition, he gave ease, pleasure, happiness, wealth; and then added honor and truth. He

had a wonderful intellect; but of what importance is that when the rest of the man is gone?

"Hawthorne's writings are of the terrible, the grotesque, and somber. There is nothing joyous in them. It is the same way with Hugo. No man ought to write so.

"— wrote a pitiful book about Napoleon. But he was a wonderful man enough; always fell on his feet. The best memoirs of him are those of Las Cases. Scott is too British; O'Meara, the Irish surgeon, writes well of him—a little low, untutored, rough; but he had personal access, and Napoleon breathed through all the men about him. What was that he said about making his generals out of mud? His meanness, which could speak no chivalric word, spoke there, but it spoke fact."

Of Margaret Fuller he spoke much at one time and another, but nothing that teaches, unless it is the following:

"I was amused with what she said of Bettina Brentano—something like this: 'She has not pride enough. Only when I am sure of myself would I pour out my soul at the feet of another. In the assured soul it is kingly prodigality; in one which cannot forbear it is babyhood.'"

He repeated the word "kingly" with a amusing circumflex, as if another woman would have used a different gender, and added:

"But she would need to be certain of her lover as well as herself—which Bettina could not. There is something, too, in the lover. Margaret never met Goethe. She was a strange woman. Her eyes in some moods were visible at night; and her hair apparently lightened and darkened. She had unconscious clairvoyant instincts, and could read the fortune in the human face; she was most inspired when in pain. What she wrote me is expressive of her deepest nature:

"'With the intellect I always have, always shall overcome, but that is not the half of the work, the life, the life! O my God! shall the life never be sweet?'"

The flame was in the heart of this dazzling woman. If Emerson was the brain of this Concord circle, Margaret Fuller was its blood.

Of this group, the most conspicuous in its domain that has ever existed in America, Mr. Emerson was easily chief; and during his strongest years perhaps he was more. There was something "catching" about him. No one could exactly explain or even understand it, but every one was sensible of it, so that his friends in England and America felt called upon to warn admirers that they must be on their guard; if they sought a familiarity closer than his pocket edition, not to be carried too far, for he could not encourage an imitator. Amusing stories have been told of

characteristic exaggerations resulting from too much Emerson in the neighborhood. Indeed one had to be more than human to remain in the presence of such a nature and not betray the fact. He was not a man to be approached closely. Nor was it well to be loved by him too dearly. Thoreau felt the perilous singling until his tones and his mode of speaking caught the trick of Emerson's so nearly that the two men could hardly be separated in conversation. What wonder that Channing, Bartol, Alcott, and the rest, strong and stately men (more than that—among the heavenliest bodies our material new world has seen), felt to some slight deflection of their orbit the unintentional, if not unconscious, attraction of the mild Jupiter so near them. Hawthorne and Margaret Fuller fled and saved themselves, but even they betrayed during their Concord residence a faint Emersonian adumbration. The fact is, no one meeting Emerson was ever the same again. His natural force was so resistless and so imperceptible that it commanded men before they were aware. Leaders, scholars of high cultivation, theorists and men of thought *de vieille roche*, who visited the lonely eminence where he dwelt apart, noticed the contagion. Then there were others, a curious throng, themselves often curiosities, who came. Concord contained during Emerson's solstitial years a great lighthouse, shining far and wide, and showing many ships their goal, but covered with the shreds of wrecked barks, which had been attracted by its clear, cold, solitary flame.

But of Thoreau, that hypethral man, I cannot say enough. Of no one did Mr. Emerson talk so often and so tenderly. The relation adverted to between the two needs a clearer understanding. Emerson made Thoreau. He was a child of Emerson, as if of his own flesh and blood. The elder took the younger fresh from college (rather drowsy, and he dozed after his return to Concord, but the Middlesex woods were his college); Emerson woke him, gave him his start, and immediately and astonishingly nourished him.

The disciple became as his master, unconsciously adopting his accent and form, realizing his attractions and antipathies, and knowing his good and evil. The development of this sturdy bud into its sturdier flower was a perpetual delight to the philosopher. In Thoreau he lived himself over again. He said he liked Thoreau because "he had the courage of his convictions," but I think he meant his own (Emerson's) convictions. In both we mark the same features; as a severe and *outré* way of looking at events and a searching for lessons in them, intolerance of makeshifts, etc.

"Henry was," continued Mr. Emerson, "homely in appearance, a rugged stone hewn

from the cliff. I believe it is accorded to all men to be moderately homely. But he surpassed sex. He had a beautiful smile and an earnest look. His character reminds me of Massillon. One could jeopard anything on him. A limpid man, a realist with caustic eyes that looked through all words and shows and bearing with terrible perception! He was a greater Stoic than Zeno or Scævola or Xenophanes; greater, because nothing of impurity clung to him, a man whose core and whose breath was conscience. But he thought and said that society is always diseased, and the best, most so. Men of note would come to talk with him.

"‘I don't know,’ he would say, ‘perhaps a minute would be enough for both of us.’

"‘But I come to walk with you when you take your exercise.’ ‘Ah, walking, that is my holy time.’

"He refused on graduating from Harvard to take his degree. ‘It is n't worth five dollars,’ he said.

"I have always thought that he did not do justice to the influence of his college in forming him.

"Though living in civilization he was the keenest observer of external nature I have ever seen. He had the trained sense of the Indian, eyes that saw in the night, his own way of threading the woods and fields, so that he felt his path through them in the densest night without delay or interruption. He would hear a partridge fly into a bush in the dark of dawn and guide you to the spot after day unerringly.

"Things happened to him, came to him, as they will to lovers of the woods and fields. I remember once a friend accosted him while they were walking, with a request for an arrow-head, if he should ever find one, lamenting how fruitlessly he had searched for one.

"‘They *are* rare,’ said Thoreau, stooping and picking up a fragment of earth-covered substance he saw in the sod, ‘and now that you have an opportunity you had better examine this!’ And he presented a fine specimen from which he finished disengaging the earth-rust. An accident? I do not know. Sometimes I think the entire woods were a *cache* for him, he had such secrets of hiding things and finding them again.”

As Thoreau exhibited Emerson the recluse, so Amos Bronson Alcott, a most benign, saintly, and unworldly man when I knew him, was a joyous, buoyant embodiment of Mr. Emerson socially. For Emerson was not what one would term “talkative.” Indeed it is seldom

one meets a man more held in duress by his own thought. When he was surprised into utterance, it was mostly a monologue of oral reflections which seemed to be addressed to a widely read and thoughtful audience, and which always exacted much of the listener. It is somewhat remarkable that a man who has given more movement to thought than almost any other since Plato should have shown in habit so little sympathy with this law by which men most naturally receive ideas. But I think he secretly found irksome the simplest conditions under which people meet.

Mr. Alcott had a much more extended adaptiveness. He founded the parlor conversation as a means of culture.

Faith in man and man's final victory was Mr. Emerson's evangel. His transcendentalism is to be regarded as a fragment existing less as a religious idiosyncrasy, much less a passing fashion, than as a lifting and permanent force in general religious culture. As a modifying influence in thought, as an impulse towards a finer life, it has become a power. Its subtle suggestions, its aspirations; that which it stood for and symbolized; its exultant, soaring spirit—these gave it meaning to every elevated soul drawn into it. Where it touched the practical duties of life its touch was recognized as honest. Mr. Emerson's language often identified God incarnate with man perfected. The future was serene. Almost the last words I was ever to hear him utter were with a smile and cheer regarding a doubt he could not dispel.

"For that," he said, "we must wait until to-morrow morning."

By

That great and grave transition,
Which may not king or priest or conqueror spare,
And yet a babe can bear,

the morrow's morning has come to him.

The true Emersonian does not seek the master for knowledge, but for wisdom, and the best wisdom, a new life. And does not this search indicate that seminal, germinal, developing quality which is the central essence of the man himself? He comes immediately into the mind, a revolutionary force, questioning, suggesting, destroying composure, provoking doubt of the order that is; destroying gods, both Penates and Totems, not with blows, but with frost and fire; emancipating thought; sowing a sane discontent and elation; then stimulator, inspirer, and liberator of power. With what other service is such service comparable?

Charles J. Woodbury.

THE MERIT SYSTEM VERSUS THE PATRONAGE SYSTEM.

THE TWO SYSTEMS DEFINED.

IN American politics there obtain at the present moment two systems in accordance with which appointments to minor governmental positions are made—the spoils or patronage system, and the merit or reformed system. The underlying principle of the former is that set forth in the pithy and now famous sentence of one of its founders, “To the victors belong the spoils.”

It treats all offices as fit objects wherewith to reward partisan service, as prizes to be scrambled for by the smirched victors in a contemptible struggle for political plunder, as bribes to be parceled out among the most active and influential henchmen of the various party leaders. The upholders of the merit system, on the other hand, maintain that offices should be held for the benefit of the whole public, and not for the benefit of that particular section of the public which enters into politics as a lucrative, though rather dirty, game; they believe that the multitude of small government positions, of which the duties are wholly unconnected with political questions, should be filled by candidates selected, not for political reasons, but solely with reference to their special fitness for the duty they seek to perform; and, furthermore, they believe that the truly American and democratic way of filling these offices is by an open and manly rivalry, into which every American citizen has a right to enter, without any more regard being paid to his political than to his religious creed, and without being required to render degrading service to any party boss, or do aught save show by common-sense, practical tests that he is the man best fitted to perform the particular service needed.

This is a perfectly fair and moderate statement of the two contrasted systems; and when the question is thus resolved into its simplest terms it is, of course, impossible for any honest and intelligent citizen to hesitate in his choice. Unfortunately, however, it is almost impossible to get the average voter to realize that the above really is a true statement of the question, when stripped of verbiage, and put in the language of naked truth. He is apt to be misled by the unceasing clamor of the interested advocates of the old spoils system; and their name is legion, for they include every

place-mongering big politician and every place-hunting small politician in the land, not to speak of the malodorous tribe of political hangers-on, who are too lazy to do honest work, and who know very well that if tried by the standard of merit alone they would no longer have the faintest chance of getting easy jobs at the public expense. These people are naturally ferocious foes of a reform which would deprive them of their exceedingly noxious influence in public affairs; and in their opposition they receive powerful aid from the cynicism of many intelligent men, who do not believe it possible to better political conditions; from the puzzle-headed inability of many honest, but prejudiced and narrow-minded, people to understand what the question really is, and from the good-nature, the indifference, the selfishness, the timidity, and the conservatism of that large number of citizens who never bestir themselves to do away with any evil that is not brought sharply home to their pockets.

One great trouble is that, thanks to having lived under the spoils system for sixty years, a great many people have come to accept it as being inevitably incident to our system of politics; and they grumble at it only as they grumble at droughts or freshets. Besides, they know there are in every party plenty of men competent to fill the offices; and they vaguely believe that it is merely a question as to which set of competent men is chosen. But this is not the case at all. If a party victory meant that all offices already filled by the most competent members of the defeated party were to be thereafter filled by the most competent members of the victorious party, the system would still be absurd, but it would not be particularly baneful. In reality, however, this is not what the system of partisan appointments means at all. Wherever it is adopted it is inevitable that the degree of party service, or more often of service to some particular leader, and not merit, shall ultimately determine the appointment, even as among the different party candidates themselves. Once admit that it is proper to turn out an efficient Republican clerk in order to replace him by an efficient Democratic clerk, or *vice versa*, and the inevitable next step is to consider solely Republicanism or Democracy, and not efficiency, in making the appointment; while the equally inevitable third step is to consider only that peculiar species of Republicanism or Democracy which is implied in adroit and unscrupu-

lous service rendered to the most influential local boss. Of course, both boss and henchman are often — perhaps generally — very good fellows, anxious to make good records and serve the public well; but it is at least safe to say that this is not necessarily the case.

The evil of the spoils system consists much less in the monopolizing of the offices by one party than in the monopolizing of the offices by the politicians at the expense of the people. Yet we have become so wedded to the vicious theory of party appointments that many men in public life are not even able to understand what is really the evil of which we complain; and hence some sapient gentlemen have recently been advocating a plan to divide all the offices among the adherents of both parties, by distributing them among the congressmen.

It may be mentioned, parenthetically, that the object and scope of the law is not yet clearly comprehended by the mass of citizens. Public confidence is a plant of slow growth, and public knowledge grows but little faster; so it is not surprising that after a sixty years' carnival of patronage politics, the average man has grown to regard it as part of the order of nature that only the adherents of the party in power need apply for offices. It is often a real labor to get men, opposed in political faith to an Administration, to come forward and be examined even for positions in offices where the civil service law is observed in the strictest and most non-partisan spirit. Yet a steady improvement is taking place in this respect. A constantly increasing proportion of the adherents of one party are coming into office while the other is in power. Most important of all, the applicants are growing more and more to realize that the change is real, and not nominal, and that their appointment and retention depend on their own good qualities, and not on political favoritism.

ATTEMPTS TO THWART THE REFORM.

Of course all the politicians to whom politics is merely a trade and means of livelihood do everything in their power to hinder the growth of this feeling, to thwart the progress of the reform, to obstruct and hamper the execution of the law, and to cripple the Civil Service Commission and the other administrative bodies by which the law is executed. Their great aim is to make the law inoperative and bring it into contempt. By loudly proclaiming that it is not going to be really observed, they often succeed in frightening away applicants for office who do not belong to their own party; and they then, of course, turn around and rail at the law, because of a partial failure for which they themselves are almost solely responsible.

Were it not for their industrious mendacity, there would be no difficulty in showing all applicants that they stand equal chances for appointment under the law without regard to politics. It is especially unfortunate where one of these men is himself appointed to some position where he has to administer the law he has derided. He can be held to a tolerably strict observance thereof, and invariably acknowledges its efficacy by shrieking that it ties his hands and prevents his appointing the "best men" (*i. e.*, his own political heelers); but, for all this, his character and utterances are sure to prevent men from applying for positions under him unless they feel they have some backing besides their own merit. Moreover appointees of this type often maladminister the law; and every such case of maladministration is made the pretext for a cry, not that the law be more strictly enforced, but that it be repealed, which would be about as sensible as to repeal the law against murder because some individual murderer has been improperly acquitted.

Much more serious harm than frightening off worthy applicants results from the unscrupulous representations of the patronage advocates. By incessant repetition of their falsehoods, they often persuade honest and worthy people that they contain at least an element of truth. All opposition to the merit system would cease to-morrow, save in hopelessly backward localities, were it possible to make people understand exactly what are its ends, and the methods by which these ends are sought to be attained. It is only comparatively rarely that men are to be found with ideals so low that they are willing frankly to announce that they believe in treating the offices simply as so much plunder. Even then they never tell the whole truth, which is not merely that they wish the victors to have the spoils, but, what is even more important, that they wish them to go only to the baser among the victors — for these are inevitably the beneficiaries of the spoils system.

Usually they insist that they themselves believe in "genuine civil service reform," but of a different kind from the one which all intelligent reformers are pressing, and which they proceed to try to prove to be a sham; and the very men who are blindest to the vicious faults of the patronage system manifest the greatest horror over the slightest shortcomings of its successor. They are the first to show capitious distrust of the sincerity of the men who are striving to better our governmental methods. Yet they evince the most touching confidence in the inherent nobility and strength of human nature when we point out that, without some help from the law, the best and purest statesman cannot grapple with the evils of the

patronage system. The moment we deal with the merit system they insist upon comparing it with an ideal standard, but clamorously defend the abuses of patronage by reminding us that this is a workaday, practical world, and that we must face things as they are.

APPOINTMENTS UNDER THE OLD SYSTEM.

A FAVORITE mental attitude of these men is the assumption that at present the government officials appoint their own subordinates, and that to take this power away from them does away with the responsibility of the heads of the various offices. This argument is so absurdly false that no one who has ever been in active politics can listen to it without smiling. In plain truth, the very essence of the patronage system, as now developed, is that executive officers do *not* appoint their own subordinates; on the contrary, these are appointed for them by the congressmen and influential local politicians. It is quite impossible for the head of a great department, or of a large post-office or custom-house, himself to select his hundreds of subordinates. Either they have to be chosen for him by some test of special fitness applied to all who choose to come forward, as under the merit system, or else he must rely on the recommendations of other men; and under the patronage system these men are of course politicians, each of whom gets as many appointments as his local "influence" entitles him to. No man who is himself in public life will deny that this is the case. In fact it is accepted as a matter of course.

The different big politicians, the senators, the congressmen, and the astute leaders who do not take office, divide up among themselves the different appointments which are nominally made by the heads of bureaus. The nominal appointing officers have more or less to say about it according to their own political standing and strength of character; but the real officers are the outsiders—who, by the way, generally get into a battle royal over the division of the spoil. It thus results that the choice of subordinates falls, not on the executive officer under whom they are to work, but on the legislator, who was, or ought to have been, chosen because of his views on the tariff, or the silver question, or internal improvements, or a national election law, and without any reference to his fitness for selecting clerks and letter-carriers. Merely to state the facts is enough to show the inherent viciousness and absurdity of the system. Each congressman has very naturally grown to regard all the

appointments in his district as rightfully his to make; and then he himself proceeds further to parcel them out to satisfy the politicians back of him. In many offices, under the old method, the different appointments were regularly credited in the books or on the backs of the papers to the politician for whom they were made; I could mention two or three where I happen personally to know that this was the practice. Even where this detail was omitted, the fact remained that the outside politicians made the appointments. Thus formerly the railway mail service was regularly parceled out, each congressman getting a definite number of postal-clerks; whereas now any sharp, capable young fellow may come forward and be appointed on the sole condition of proving by fair, business-like tests that he is better fitted than his competitors to fill the position he seeks. If the present superintendent of the railway mail service were to retain his position under successive administrations of varying political creed, the sole condition of his retention being his efficiency in the management of his business, and no politician being allowed to say anything whatever about his subordinates, it would be perfectly safe to leave the appointment of the latter solely in his own hands. But, as a matter of fact, his retention in office four years hence depends not in the least upon his record as a faithful public servant, but upon the success or failure of his party in the presidential election; and under the old system the right to appoint his subordinates was always claimed by, and allowed to, the congressman and influential local politicians. It was therefore an immense step in advance when the appointments to the railway mail service were taken away from the politicians altogether and were made to depend solely on the success of the candidates in honest, common-sense, competitive examinations.

Be it remembered that the blame attaches to the system which permits and encourages congressional interference, and not to the congressmen who are obliged to act under it. Where it has come to be an understood thing that the congressman is the appointing power he has often no choice but to make the appointments; if, as is very likely, he is a pretty good fellow, he will make good appointments; but at any rate make them he must. For a single congressman to refuse to say anything about appointments, while leaving the system unchanged, would accomplish absolutely nothing.¹ He should do all he can to abolish the system; but as long as it exists all he can do

¹ While on this point I wish to express my emphatic dissent from the position taken by some good friends of the reform who seem to me to do positive harm by attacking all public men alike. In fact they prefer to

assail, not the spoilsmen, but stanch friends of the reform who under present circumstances cannot—and ought not to be expected to—come up to the highest theoretic standard. We must stand by the best men

is to make the best of it and see that only good appointments are made; and this is the course followed by a very large number of congressmen. To illustrate what I mean I will take an instance from my own experience. The first year I was in the legislature there was a great deal of work being done on the Capitol buildings. Stone-cutters were in especial demand, and they were regularly parceled out among the different State senators and assemblymen, each of the latter having a certain number of appointments to which, by a custom that was then quite as binding as law, he was entitled. Sometimes good and sometimes bad stone-cutters were appointed under this method, and the whole business was to me so intensely distasteful that at first I refused to have anything to do with it. The consequence was merely what, with a little more experience, I might have foreseen. The appointments that should have come to me were given to a couple of neighboring assemblymen, and the stone-cutters from my district — very decent, honest men — were left out entirely, and felt correspondingly aggrieved. When I realized how things stood I promptly asserted my rights, claimed the appointments for my district, and gave them out to my district stone-cutters according to an improvised merit test of my own. I then proceeded to take the only practical way of bettering matters; that is, I worked hard, and in the end successfully, for the establishment of a system under which *none* of the assemblymen had any say whatever in the appointments. In my own case I did not need to pay any heed to the political advantages or disadvantages of the patronage; but this is an element of the problem which cannot be ignored. I feel sure that the possession of the patronage damages rather than benefits a party; but it is certainly also true that for one party to refrain from all use of patronage, while not by law enacting that its opponent must likewise refrain, would work little lasting benefit to the public service, and would probably insure party defeat. It is precisely as in boxing. In college we used to be very fond of sparring; and of course the rules expressly excluded hitting below the belt, and foul blows generally. These rules made the sport fair and manly; otherwise it would have been brutal. But if there had been no such rules it would have been silly, and would have accomplished no good purpose, for a man to spar at all, if he did not himself hit below the belt while allowing his antagonist to do so. A

change in the rules, prohibiting foul hitting on either side, would have been the only way to work improvement.

It is therefore perfectly plain that the remedy lies in changing the system. For honest politicians to refrain from meddling with patronage, while leaving dishonest politicians full liberty to do so, is in the long run to work harm rather than good. The offices must be taken out of reach of all politicians, good or bad, by some permanent system of law.

IMPROVEMENT IN THE PUBLIC SERVICE.

THE civil service law accomplishes this end wherever it applies and is enforced; and in consequence the government employees protected by it, over 28,000 in all, — nearly a fourth of the total number in the service of the United States, — are now withdrawn from the degrading influences of the spoils system; and, as a direct result, in these offices the public business is performed more honestly and efficiently than ever before, while the offices themselves no longer form part of the vast bribery fund which is what the official patronage has become. The adherents of the old system naturally detest the new one, because of the good which it has done; and when, for very shame, they dare not openly defend the abuses by which they and their kind profit, they strive to do it indirectly by attacking the proposed remedy. They admit that the patronage system is evil; but try to delay real reform by proposing some foolish measure that would accomplish nothing but harm, or else confine themselves to clamorous misrepresentations of the purpose and scope of the only genuine measure of relief that has yet been proposed. A sample of the former method is the advocacy of the plan already spoken of to divide the offices among the congressmen, giving to each the appointment of all the government employees in his district. This proposal has recently had some vogue even among men of fair experience in public life, albeit that among its other defects it happens to be unconstitutional. Even if the last objection did not apply, the adoption of the plan would of course mean nothing but the revival of the old spoils system with an added touch of chaos. Its advocates evidently have some puzzle-headed idea that what is needed is not to take the offices out of politics, but to divide them permanently between the politicians of the two parties, instead of giving them all to each party in turn.

who are actually able to do good service in public life under its present conditions. Undoubtedly good men in public life should be freely criticized whenever they do wrong; but all should be judged by one standard in making comparisons. It is folly to strengthen our foes

by assailing our friends; and indiscriminate and unintelligent blame is quite as harmful as indiscriminate and unintelligent praise. We do not, as a people, suffer from the lack of criticism, but we do suffer from the lack of impartial and intelligent criticism.

THE MERIT SYSTEM THOROUGHLY AMERICAN.

As a rule, however, the opponents of the reform neither argue intelligently against it nor propose any substitute, but confine themselves strictly to simple misrepresentation and abuse. It is, of course, the kind of measure which especially arouses the ire of the cheaper variety of demagogue—the man who naturally opposes any measure to promote honest and decent government. Such a one has not morality enough to be ashamed of avowing that he wishes to pay off his private political debts by bribes, at the public expense, in the shape of offices, and is both too coarse-minded and too dull-witted to feel the scorn with which he and his antics are regarded by all upright and honorable thinking men. No argument is too flimsy or too contemptible for him to try. He takes great delight in calling the merit system “Chinese,” apparently because one of its adjuncts is the competitive examination, while in China there has long existed a clumsy and overgrown system of such examinations. As well might he inveigh against our alphabet because the Chinese have long had a cumbersome alphabet of their own, or against the use of gunpowder because it was first used in China, or decline to carry a Winchester rifle because jingals have long been known in the East. Again, he rails at the system as “English,” and as tending to produce an “office-holding aristocracy.” Of course he does not believe these arguments; he can’t, and retain his sanity. While England was a purely aristocratic community the spoils system flourished there far more rankly than ever it did here; and it is only since England has begun to take giant strides towards democracy that she has introduced the merit system, which the founders of our own Republic regarded as the only one worthy of a free and high-minded nation. A system which opens the public service to all men, of whatever rank in life, who prove themselves most worthy to enter it, and which retains them in office only so long as they serve the public with honesty, efficiency, and courtesy, is in its very essence democratic; whereas, on the contrary, the spoils system—which still obtains in most European kingdoms, and reaches its fullest development under the despotic government of Russia—is essentially undemocratic, in that it treats the public service not as the property of the whole people, to be administered solely in their interest, but as a bribery chest for the benefit of a few powerful individuals, or groups of individuals, who use it purely in the spirit of personal or political favoritism. It is among the most potent of the many forces which combine to produce the ward boss, the district heeler, the boodle alder-

man, and all their base and obscure kindred who in our great cities are ever striving to change the government from an honest democracy into a corrupt and ignorant oligarchy, wherein only the vile and the dishonest shall rule and hold office.

When a man is ashamed to use such merely demagogic arguments, he commonly, as a last resort, assails the methods by which it is attempted to put theory into practice, and especially the competitive examinations. Of course in introducing a radically new system there is bound to be friction. In extending the limits of the classified service inevitably from time to time mistakes are made, which the Commission strive forthwith to correct; and in preparing a multitude of examination papers they occasionally ask questions which it would be wise to leave unasked, or try to test a man’s capacity in some way which experience shows will not work satisfactorily. Any fault of this character should of course be pointed out and immediately remedied; but, equally of course, it furnishes no serious argument against the system. There are a very few more serious shortcomings; but it is noticeable that opponents hardly ever allude to these, or dwell on any point worth serious discussion. They prefer to make and repeat over and over and over again assertions which it is a euphemism merely to call misstatements. They have been refuted very often; they have been conclusively shown to be wholly and utterly false; but their sponsors stand up for them with such unabashed effrontery that it is necessary to keep on answering them.

One of these assertions is, that the examinations favor “boys fresh from school,” instead of men with experience of the world. This is simply untrue. The average age of successful candidates for the ordinary positions, such as those of clerk and letter-carrier, is about twenty-eight years. The boy fresh from school evidently stands less chance than the man who has left his school days at least ten years behind him.

THE QUESTIONS CANDIDATES ARE ASKED.

BUT the favorite assertion is, that “irrelevant” and “impractical” questions are asked. This again is simply false. The Commission strongly object to asking irrelevant questions. Surely no questions can be so irrelevant to a man’s duties as copyist or railway mail clerk as are questions about his political backing and about how he voted at the last election; and these are the very questions which those who thus prate about the examinations are themselves desirous of asking. As a matter of fact the questions are strictly pertinent to the positions for which the candidates are examined. The Commission has not yet tried to intro-

duce a merit test for laborers, although this must in the end be done (probably on the lines indicated by the Massachusetts State law, which provides for a system of registration of laborers). As yet, the great bulk of the examinations, probably ninety per cent., are held to fill positions as clerk, copyist, letter-carrier, and the like. In all these cases plain, common-sense questions are asked, such as appeal to the average intelligence as being suitable for testing the applicant's fitness for the special position he seeks to fill. A copyist or a clerk must be able to spell well and make grammatical sentences, he must write a good hand and be able to copy from a rough draft or from dictation, he must know how to do simple sums in arithmetic and have some acquaintance with the elements of bookkeeping, and he ought to be able to write an intelligent letter on some given subject; and therefore the questions test him on just such points, and, furthermore, require him to show a rudimentary acquaintance with United States history, government, and geography, as is befitting in one who seeks to serve Uncle Sam. A railway mail clerk is required to show a knowledge of the railway systems along the route where he is to serve, a tolerably intimate acquaintance with the geography of the United States, and skill in reading off a multitude of addresses on letters. A letter-carrier must be acquainted with the local geography of his city. If questions on subjects like these are not practical, then there are no practical questions in existence. As a matter of fact, the men who speak of the questions as impractical, or as referring to "the sciences," or the "geography of Asia and Africa," simply do not know what they are talking about; and their ignorance can hardly be called honest, for they have no business to speak on a subject about which

they could readily learn, but of which they are wholly ignorant. In dealing with these gentry I have now adopted the plan of using an argument sufficiently direct to appeal even to their intelligences. Whenever I meet a man who inveighs against the Commission for asking a letter-carrier "how far the earth is from Mars," or "to bound Timbuctoo,"—and I have heard men seriously assert that the Commission ask such questions,—I merely offer to bet him some moderate sum that he cannot produce a single instance where the Commission have actually asked such a candidate such a question; and he invariably refuses the bet, and on cross-examination admits that he does not personally know anything about the matter.

Finally, we who believe in the reform refer to that best of tests, experience, as demonstrating, beyond all question, that the merit system is not only practical, but produces the most admirable results. Wherever a public officer has taken office, believing in the law, or, even if not believing in it, willing to give it a fair and honest trial, it has invariably been found to work well. The public offices which have furnished the most conspicuous examples of honest and efficient administration of the public business have been precisely those in which the civil service law has been most rigidly and scrupulously obeyed. The post-offices at Boston, Brooklyn, New York, and Washington, under Messrs. Corse, Hendrix, Pearson, and Ross, may be instanced as showing one side of this picture, and those at Baltimore, Milwaukee, and Indianapolis, under Messrs. Veazey, Paul, and Aquila Jones, as illustrating the other.

The merit system is the system of fair play, of common sense, and of common honesty; and therefore it is essentially American and essentially democratic.

Theodore Roosevelt.

TOPICS OF THE TIME.

Further Electoral Reform.

NOW that the adoption of the Australian secret-ballot system as the American system is practically assured within the near future, it is time to consider what further steps are necessary to complete the reform of our electoral laws which has been thus so worthily begun. The advocates of ballot reform have always recognized the fact that that was only the first step in a series, but they considered it wiser to attempt only one step at a time. When they had secured a secret, official ballot they were determined to bend their energies at once upon the logical follower of that reform, the limitation of campaign expenditures. It was necessary first to get the machinery of the elections and the printing and distributing of the ballots out of the hands of the political machines or organizations and into the hands of the sworn officials of

the State. This change would remove all excuse for assessments upon candidates for election expenses, and the secret ballot would abolish to a great extent the bribery of voters, by making it impossible for the briber to see whether the voter kept his bargain or not. When this had been done—that is, when corruption had been made both inexcusable and unprofitable—it would be comparatively easy to have it made illegal and to abolish it entirely.

This is the work which our reformers have in hand now, and they have in this, as they had in the secret-ballot movement, valuable experience by which to be guided. England has followed the same order as we are following. Her ballot act, closely modeled upon that of Australia, was adopted in 1872. Eleven years later Parliament passed the justly famous "Corrupt and Illegal Practices Act," which was a totally new departure in legislation, and under which bribery

and corruption of all kinds have been abolished from English elections.

Every conceivable form of bribery or undue influence, including "treating," is defined, and the penalty is fixed. The maximum amount of expenditure which each candidate can make is named, proportionate to the size of his constituency. This sum must cover all expenses: printing, postage, room-rent, clerk-hire — everything. All disbursements must be made by one person, either the candidate himself or his agent. If he employs an agent to disburse the money, he cannot disburse a farthing himself, but must leave it all to the agent. An account with vouchers must be kept of all expenditures and returned under oath to the proper officers after election. Any person found guilty of an "illegal practice" is liable to a fine of £100 and five years' incapacity for voting, while a candidate guilty by himself or his agent loses his seat and is disqualified for sitting for the same constituency; in the former case for seven years, in the latter during the existing Parliament. Minor offenses of illegal payment, etc., are liable to a fine of £100. Any candidate whose expenditures exceed the maximum loses his seat. The law is so minutely drawn that a member who had been elected under it to Parliament was unseated because he had, during the election, promised a voter the privilege of shooting ground game upon his estates. That was declared "undue influence."

When this act was passed, after two years and a half of heated debating, there was almost universal skepticism concerning its practical value. It was thought, as our politicians persisted in saying of the Australian ballot system, to be too "complicated" ever to work well in practice. Its success was instantaneous and marvelous. The total expenditures of the last election under the old law were estimated as reaching about \$15,000,000. At the first election under the new law this total dropped to about \$3,900,000, and at the second it dropped to less than \$3,000,000. Before trial it was thought that the maximum allowed for expenditures was too low, and would have to be raised. After two elections had been held it was shown that instead of being too low, it was at least one-fourth higher than need be. In the second election the total expenditures did not reach by one million dollars the maximum allowed by law. These were remarkable triumphs, but they were not all. After the last election under the old law there were made to Parliament no less than ninety-five petitions against returns on the ground of corruption and bribery. After the first election under the new law there were only two such petitions, and after the second election there were none. A system of bribery more extensive and demoralizing than any which we have ever had in this country had been annihilated without a struggle.

It is not likely that we shall require so elaborate a measure here, for we have never suffered from many of the evils that had to be reached in the English statute. A very good bill, which seemed to cover the most important points, was introduced in the Massachusetts legislature last winter, passing the lower house but being defeated in the upper. It was the first measure of the kind to appear in an American legislature. It required sworn publication after election, both by candidates and by committees, of all expenditures made for campaign purposes. Every political cam-

paign committee in the State which expended an aggregate of more than \$100 in a campaign was required to have a treasurer, through whose hands should pass all the money received or expended, who should keep a detailed account of all receipts and of the manner of all expenditures, and who should within thirty days after election "file with the Secretary of the Commonwealth a return, subscribed and sworn to by him, setting forth all the committee's receipts, and a detailed statement of all expenditures and disbursements." Any member of the committee who should receive or disburse any money for political or campaign purposes was required to give the treasurer a detailed account of the transaction, and the latter must include it in his return. Every candidate for Congress or State office was required, within thirty days after election, to file with the Secretary of State a "detailed statement, subscribed and sworn to by him, of all moneys contributed or disbursed, promised or expended by him, or by any one, to the best of his knowledge and belief, in his behalf in attempting to secure, or in any manner in connection with, the nomination or election to such office." The penalty for making a false return or for violating any provision of the act was fixed at a fine not exceeding \$1000, or by imprisonment not exceeding one year.

This measure, while not perfect, supplies a sure basis upon which to construct the statute which is needed and which every American State ought to adopt. The success of the ballot law in Massachusetts is certain to make easier the early passage of such a statute there, and it is not improbable that she will have the honor of being the leader in the second step of electoral reform, as she has won it in the first. Her lawmakers are likely also to extend the application of the ballot law to caucuses and primaries. It has been successfully tried in a primary in Boston.

The Fire-Risk.

It has been said that the greatest discovery yet made by man, in his work on this planet, has been the artificial production of fire. It is then a curious commentary on man's power to master natural forces that he should not yet have succeeded, during his thousands or millions of years in the world, in reducing the hazards of fire to the lowest possible limit. Fire will probably always be as bad a master as it is good as a servant; but the odd thing is that it should still appear so frequently as a master. Why is not this unruly servant brought to terms? Why should smoking ruins and a heavy death-roll still mark from time to time the places where great buildings once were, or a helpless people watch the flames as they eat up the city and leave desolation behind them?

It is only fair to say that in our own country this state of things has resulted mainly from that rough estimate of chances which a shrewd people will make with considerable accuracy. American agriculture used to be surface and scratchy in its methods, just because those were the only methods which "paid" under the circumstances; but any change of circumstances towards the opposite pole has shown that American agriculture can come very near the Dutch ideal of minuteness and carefulness. So, no doubt, the building of flimsy cities in the West was at first an economical thing to do. The structures had to come down some time: it was

cheaper for San Francisco, Chicago, and hundreds of other new cities to supply their present wants at as low a rate as possible, taking their chances whether the inevitable removal should be by the gauge of the contractors or by the all-pervasive fire. And if some Western cities have paid the penalty of the phoenix process, hundreds of others have profited by being their own insurers, and have come safely at last into the hands of the architect and the contractor.

But the case is complicated by the fact that such risks are not stationary, but grow as wealth grows, so that a reasonable "security" now might be decided insecurity twenty years hence. There were unpleasant whispers that a fire, which was subdued only after a desperate struggle by New York City's admirable fire department, needed but a shift of wind to have baffled the firemen's efforts and swept down through the richest districts of the richest city of America. It may have been worth while to carry such a risk twenty-five or fifty years ago, but is it worth while now? Here is stored up the wealth of continents, the capital which moves a vast and varied system of manufactures: is it wise for such a city to throw the heat and burden of its struggle for existence upon firemen, and underwriters, or to insure its own wealth upon such a cast as a shift of wind?

We know that incombustibility, though expensive, is possible: the only question for an American city to face is whether the time has come to attain to it. THE CENTURY MAGAZINE¹ has described the slow-burning system of construction for factories which can make a manufacturing city practically exempt from any risk of general fire. We have often found that buildings which had been considered "fireproof" go down helplessly before a really hot fire, as in the second Boston fire; but Berlin and other European cities can show us types of building in which the architectural use of cement, brick, and metals could meet New York's most varied or urgent needs of lofty buildings without any serious danger from fire: is it worth while? The competition of producers of buildings is not enough to answer the question; combustibility is so easily veneered over by an appearance of the opposite that an illusory safe-deposit building, for example, might be safe from the inspection of its customers. It is only an expert architectural opinion which can tell us whether a building is really incombustible; and it is only by the use of such opinion that a municipal administration can say intelligently whether it *is* "worth while." It is only when a municipal civil service has banished "spoils" absolutely and has taken expert opinion into its service that it can command public respect for its assertion that the time has come when certain parts of the city shall contain no structure which *can* burn. Meanwhile one can only suspect that a bank might as well do business without a fireproof safe as that the wealthier American cities can continue to carry their present fire-risks.

Perhaps the double danger from fire and water has enabled competition to bring us much nearer the time when we shall build only such passenger vessels as will not burn because they cannot burn. At the beginning of the development are the frightful scenes attending such affairs as the burning of the *Lexington* in Long Island Sound; at the other we have our modern river, sound, and lake steamers, where there is still a fire-risk, which is largely neutralized by the intelligent

and vigilant service of steamboat companies which cannot afford to have even a single disaster by fire. But this is probably the highest achievement of competition in this direction. It has been far overmatched by those metallic steamers of the ocean service, divided into a multitude of compartments so completely disconnected that a fire might rage in one of them throughout an entire Atlantic voyage without danger to the rest of the vessel.

But competition, after all, has its limits in all the cases named: it is too easy for makers of buildings or boats to pretend to imitate, and too difficult for the occupants to know whether the imitation is faithful and true. The Union, the State, and the city must supplement and stimulate competition by their police powers of legislation and inspection. Why should the wealthiest parts of a great modern city have a single building in or near them that can burn? Why should any passenger steamer carry combustible freight, or neglect the known conditions of absolute security from fire?

The New President of Columbia College.

THAT a man of the character and training of Mr. Seth Low has been placed at the head of New York's leading educational institution is a matter of much more than local significance. Mr. Low is not a mere business man of culture, whose training in affairs, whose executive capacity, make him desirable as the business manager of a great educational corporation. He is notably, and above all, a student of political economy; as well as of the principles and practice of government. He is familiar with economical questions both in theory and practice; while his experience as a public administrator makes him an expert in a science which is commanding more and more the attention of civilized communities.

The new President of Columbia, though he has during a busy career kept up his interest in the classics, is as a scholar identified more especially with other, and no less important, studies. He is a specialist of authority in the lines referred to above. It is this aspect of his presidency which seems to us of such peculiar interest. The American Republic never needed more than it does now, at the dawn of its second century, an insistence in all its educational enterprises—from the kindergarten to the university—upon *training in citizenship*.

President Low has an inspiring opportunity, in his new position, of making his mark upon this community and upon the country at large. Those who have pondered on the needs of New York have dreamed of a time—which Mr. Low can, and we believe will, do much to hasten—when Columbia College will be the center, and our various museums, libraries, and other institutions more or less formal and official parts, of "the great metropolitan university"; and of a time when the influence of this university will be felt, for purification and for elevation, in every part of our educational, social, and political life. It ought to be—and it will perhaps one day seem not ludicrously impossible—that such an institution as the Columbia of the future should exert more influence, in an entirely disinterested way, in municipal matters, than the "bosses" who have so long dictated the course of affairs—whose chief motive in public life is sordid and ignoble, and whose existence is a constant menace to the public morality and welfare.

¹ See article by Edward Atkinson, February, 1889, p. 566.

OPEN LETTERS.

Was Swedenborg Insane ?

IN THE CENTURY MAGAZINE for July, 1889, is an interesting paper by Rev. Dr. J. M. Buckley on "Presentiments," etc. On page 461, under the title of "Habitual Visions," Swedenborg is referred to as one who "was a professor in the mineralogical school. . . . About 1743 he had a violent fever, in which for a little time he was mad, and rushed from the house stark naked, proclaiming himself the Messiah. After that period . . . he lived twenty-nine years in the firm conviction that he held continual intercourse with angels and also with deceased human beings. He says that he conversed with St. Paul during the whole year. . . . He asserted that he had conversed three times with St. John, once with Moses, a hundred times with Luther, and with angels daily 'for twenty years.' . . . He gives detailed accounts of the habits, form, and dress of the angels. He sends his opponents mostly to Gehenna and sees them there," etc.

These matters, being personal, have no more to do with the theology of the New Church than the cut of Mr. Wesley's coat with Arminianism, but they should be set right if misstated. The facts are that Swedenborg was never a professor in any school, but that Dr. Buckley misunderstands the office of Assessor of the College of Mines; that his alleged fever, with its consequences, was not mentioned till 1781, and again in 1796 by the same person; that these two accounts differ so much as to be impossible of reconciliation; that Swedenborg was not in London in 1743, when this was said to have occurred; that at that time he was engaged upon his great scientific work on the Animal Kingdom; that he continued till his death an active and respected member of the House of Nobles; and, in short, that there is no evidence that he was ever insane, except the conflicting stories, fifty years old, of one who himself ended his life in insanity in 1808.

As to the other statements of Dr. Buckley it may be said briefly that Swedenborg set the date of his perception of spiritual realities not in 1743, but in 1745; that his reference to conversations with Paul and others, which Dr. Buckley regards as a claim to credibility, was written in a private letter in answer to a question whether he had conversed with the apostles, and was not put into his published writings at all; that he gives no other details as to the angelic life than are necessary to illustrate spiritual laws; and that he sent no opponents to hell, because he had none, having nothing to do with theological controversy.

NEW CHURCH THEOLOGICAL SCHOOL,
CAMBRIDGE, MASS.

T. F. Wright.

THE inaccuracies alleged do not touch the substance of the case. Swedenborg is spoken of in the article criticized as a "professor in a mineralogical school"; it would have been more accurate to say an "Asses-

sor in the College of Mines." The sole purpose of this reference was to indicate his pursuit of natural science.

The phrase "*about 1743*" was employed to indicate that period of the eighteenth century, as there are conflicts of testimony which put the date of the alleged fever, and the beginning of Swedenborg's visions, anywhere from 1743 to 1745.

John Wesley positively affirms that he received the account of the fever, not only from the man in whose house Swedenborg was when it occurred, but also from "a serious Swedish clergyman, the Rev. Mr. Mathesius."

The statement about Swedenborg's conversations with Paul, John, Moses, and Luther is confirmed by the writer of the foregoing note, who says "it was written in a private letter."

The statement that Swedenborg had nothing to do with religious controversy is erroneous. I have examined some of his original manuscripts in the University of Upsala, which are written in English, and in which he severely criticizes all existing forms of religion. He expressly states that "Arians have no place in heaven."

It is only necessary to consult Swedenborg's works, not confining attention exclusively to those published by his votaries, to find abundant evidence of the subjective nature of his hallucinations, which is the only proposition maintained concerning him in the article referred to by your correspondent.

J. M. Buckley.

Base-Ball and Rounders.

AFTER reading Mr. Camp's interesting article on base-ball, in THE CENTURY for October, 1889, it appears to me that this game is merely the old English rounders played in a scientific manner.

It is possible the latter game is not familiar to the American public, and, if not, I would describe how it was played at my old school thirty years ago.

A game being decided on, the two best players chose sides, or, as it was termed, "picked up," selecting alternately those boys they preferred for their respective sides. The number on a side would vary from eight to ten; they next tossed up for first innings.¹

The base-ball "pitcher" was termed with us a "feeder"; the "field" was placed according to directions of the captain of the outing side, much the same as in base-ball.

Instead, however, of the ball being hurled with great force at the striker, the rule was to "lob" it.² The

¹ In the greater part this description is also true of the ordinary "scrub game," or "choosing sides," of American players.—WALTER CAMP.

² The modern base runner would have no difficulty whatever in stealing a base if the pitcher "lobbed" the ball, as the time occupied in its progress before reaching the catcher would be sufficient to see him safely near the next base.—WALTER CAMP.

striker could refuse to hit at any ball not to his liking, but at the first ball he struck he had to run to the first base. He was allowed three chances of striking at the ball, and if he missed the third he had to run in any case, being generally put out by the catcher "corking" him before he reached the base. As in base-ball, a ball struck and caught by one of the "field" made the striker of it "out."

We played with a thick round stick about two feet long and a ball covered with knotted string, perhaps two sizes smaller than an ordinary cricket-ball.

With us boys the great delight of the game was "corking," which was to hurl the ball with as much force as possible at any player while running between the bases, and if the ball struck him he was "out," and could play no more that innings.¹

One of the arts of rounders was to "steal bases"; that is, if a player was at, say the first base, and the second was vacant, he would endeavor to run to the second while the "feeder" was feeding the striker at the striking base; and very often he got "corked out" for his trouble.

A "rounder" was when a player struck the ball with such force as to enable him to run all four bases and "get home."

We did not count any "rounders," as is done in base-ball; but the moment there was no player left to strike at the striking base the innings was closed and the "scouting" side then went in, the other side turning out in the "field." The main object of the game was to have as long an innings as possible.

Such is a rough description of rounders. Personally, although rank heresy, I always enjoyed the game more than cricket.

CROYDON, ENGLAND.

"The Newness."

TO THE EDITOR OF THE CENTURY MAGAZINE.

DEAR SIR: A friend has called my attention to an article on "The Newness," in the November, 1889, number of your magazine, wherein is some matter pertaining to my former self.

It is true that I did take a trip on foot with Samuel Larned as far as Concord, New Hampshire; not "far up into Vermont," a State I never set foot in; not of six weeks' duration, but perhaps of two; and with no "mission" whatever, but only from the desire of a farmer's boy, after husking, to see a little of the world, and to visit, in the bosom of his beautiful family, one I was ever proud to claim as a friend, the brilliant N. P. Rogers. Here I left Larned and proceeded afoot and alone to the town of Bradford, where, in the delightful household of the Tappans, Parker Pillsbury was staying to recover his exhausted nervous system, worn down in the work of reform. My brother Cyrus was not one of the party. Neither was he, nor I, ever touched by the "anti-money" folly; and I can vouch for it that any man who had Sam Larned for a traveling companion would have seen no occasion to throw his money into the river.

¹ In early American playing it was permissible to throw the ball at a runner. One of the American college men who went across the water last summer with a few others, to help introduce the sport in England, told the writer that they were badly frightened many times by the unconquerable desire that possessed every English player to throw the ball at them when they were running.

For the worthy memory of Robert Carter I am glad to see that, though claiming to have been personally acquainted with these youths, he does not assert a personal knowledge of the incidents recorded. He must have followed hearsay; and of the two who alone could know, I can answer for one who was not his informer, but

Yours very truly,

PROVIDENCE, R. I.

George S. Burleigh.

The New Croton Aqueduct.

FROM an "Open Letter" to the Editor from Mr. B. S. Church, formerly Chief Engineer of the New Croton Aqueduct, we print the following concerning the article in the December CENTURY:

"No extensive masonry structure was ever built that escaped scamped work, least of all, lining masonry built in tunnels, where conditions are so propitious for scamping. Shortly after the masonry work began I personally discovered the first bad backing masonry at Shaft 9. It had been slipped in by an adroit workman and had escaped the notice of a competent inspector in charge. Strict vigilance was demanded on the part of the assistants and inspectors, and orders given that bad masonry, wherever discovered, should be pulled down and properly rebuilt. This was enforced from the beginning of the work. After a time, so frequently did it occur, that I detailed my deputy to devote himself exclusively to its detection and prevention, and later on obtained from the commission authority to organize a systematic investigation of the workmen's methods of concealing slighted work. These clues were followed up by breaking holes in the completed masonry. Special means were devised to detect imperfections, and the matter thoroughly systematized. All this was done months before public attention was drawn to it.

"Then at my request the former commission forced contractors to make special agreement in addition to the original contract to repair at their own expense all defective work found. I instituted a special system of repairing bad backing without destroying good brick-work facing it. These methods are used to this day to secure the integrity of the work. All of this, as previously stated, was long before the Senate investigating committee convened which resulted in the 'change of administration' referred to in your article. So soon as these systematic methods of hiding bad work were unearthed, the former commission indorsed my order that payments should be withheld to cover all that was even suspected of not being up to contract. Thus the city's interests were protected, and \$1,000,000 withheld to cover cost of repairs.

"Shortly after it was understood that there was no chance to escape detection, and that the bad work was to be repaired at the expense of the contractors, I was interviewed by one of them and told that if I did not 'let up,' as he expressed it, 'they would have a Senate investigation that would break me up.' Of course this threat did not alter my action, and in due course it

At one time one of the Americans was within a few feet of second base and running towards it when an Englishman, a few feet on the other side of the base, hurled the ball directly at the runner, barely missing his head. As the American ball is not a soft one, the fright caused was nearly enough to stop the playing of this particular man during the rest of the trip.—WALTER CAMP.

was executed. I believe some good men have been honestly misled, but that the plot existed and will cost the city dear there can be no question."

An Anecdote of Jefferson Davis.

JEFFERSON DAVIS was not by any means a general universal favorite among the Confederates, either soldiers or civilians. While many considered him arbitrary and self-willed, it is doubtful if any one man in the entire Confederacy for one moment doubted his honesty of purpose.

A year before the close of the war army orders brought me to Columbus, Georgia. At that place the Confederate Government had located a large ordnance establishment. An ordnance officer, Colonel Oladowski,—not unknown, I believe, in the old service,—one day handed me a heavy black object some six inches in diameter, saying, "What is that?" I answered, "A lump of coal." "Examine it closely," said he.

Taking a knife and cutting it, I found it to be a hollow iron casting roughly shaped to resemble coal, and covered with asphaltum or some such substance in which was baked coal dust and small lumps of coal, giving the whole the exact appearance of ordinary coal.

A number of similar pieces were exhibited, of various sizes and shapes. The officer explained that he had had them made, had carried some of them to Richmond and had exhibited them to President Davis, with a carefully prepared plan by which he proposed to have them sent by suitable men to various points on the Mississippi River where the Federal gun-boats coaled, and, after being filled with a most powerful explosive, deposited among the coal designed for the gun-boats, or even introduced into their bunkers. He had also perfected a plan to have them introduced into the Northern navy yards and in various foreign coaling stations of the United States navy. That it could have been done by shrewd and desperate men is beyond a doubt.

As the explosive with which they were to be filled was one of the most powerful, and only exploded by heat, they would not have been detected, and exploding in the furnace of a gun-boat would have sent all on board to the bottom.

The officer told me that when he exhibited them to Jefferson Davis the President was horrified, and furiously declared himself insulted that any man should have dared to suppose that he would be a party to any such unjustifiable mode of warfare; "and," said the officer, "the President's eye fairly blazed while he gave me such a blessing that I would have been glad to crawl into a rat-hole to get away from him. When he had exhausted his fury he said abruptly, 'Return to your station, sir, this very day.' I firmly believe he would have put me in arrest and preferred charges, but that he did not want the matter to become public." 1

Carlisle Terry, M. D.

COLUMBUS, GEORGIA.

Comments on "Abraham Lincoln: A History."

I.—MCCLELLAN AND THE PEACE PARTY.

I HAVE read with deep interest Nicolay and Hay's history of Lincoln from its opening chapter to the present. While I believe that as a history of the lamented martyr President it is an excellent and in the main a correct work, I have found much in it, especially wherein it refers to General McClellan's conduct while in command of our armies, which seems to me to be unjust to a loyal and brave soldier whose lips are sealed in death. In the *AUGUST CENTURY*, at page 548, the writers use the following language:

The Democratic convention was finally called to meet in Chicago on the 29th of August. Much was expected from the strength and the audacity which the peace party in the Northwest had recently displayed, and the day of the meeting of the convention was *actually chosen by rebel emissaries in Canada* and their agents in the Western States for an outbreak which should effect that revolution in the Northwest which was the vague and chimerical dream that had been so long cherished and caressed in Richmond and Toronto.

I can see no motive in this paragraph other than that of throwing discredit upon the Democratic leaders of that day, and an attempt to throw around its standard-bearer, General McClellan, and his thousands of loyal friends, both in and out of the army, at least a filmy cloud of disloyalty.

All know that at that time, 1864, there was among all classes great and general dissatisfaction regarding the Administration in its conduct of the war. None doubted the loyalty, the integrity, or the honesty of the great war President, but our general want of success in the field, the numerous and rapid changes of our commanding generals, and above and beyond all the management of the War Department by Stanton and Halleck, apparently regardless of the wishes of the Executive, had begotten a feeling of unrest in the minds of all loyal people, both in and out of the army, and very largely the belief that Mr. Stanton especially had no desire to bring hostilities to a speedy determination by capturing Richmond and thus ending the war.

The overwhelming defeat of Vandaligham for governor of Ohio the fall previous, by an opponent without personal magnetism or individual strength, other than that he represented the spirit of national loyalty in the people after the great Democratic victories in New York and other Northern States in 1862, and without any considerable victories in the field meanwhile, had amply demonstrated that the "peace element" was to be despised rather than cultivated and made the controlling element in the party.

I personally had full means of knowing, and know that in the early months of 1864 it was the earnest desire of the "peace party" to possess themselves of the Democratic party machinery; that their great aim was to nominate Mr. Seymour of Connecticut for President and Mr. Vandaligham for Vice-President, and make the presidential struggle on that issue. To that end they endeavored to induce members of the National Committee to call an early convention, place the ticket in the field, and thus avail themselves of the nascent feeling of antagonism against the Administration. I was present at the house of George Greer in 28th street at one of these conferences, in the early part of 1864, at which I met Mr. Vandaligham and

¹ In a letter written after this article was accepted, Dr. Terry says, "I have since heard, though I do not know if true, that the torpedoes spoken of were used on the Mississippi River." There does not appear to be official confirmation of this.—EDITOR.

several others of the Western "peace party," and at least three members of the Democratic National Committee. Vallandigham there urged his plan of an early convention, and scouted the idea of nominating McClellan, or any other soldier or war Democrat, as puerile in the extreme.

Not long after this conference, and on March 10, 1864, I was seated beside Reverdy Johnson at dinner, at the house of Richard Wallack in Washington. Mr. Johnson, like myself, was a staunch friend of General McClellan. I narrated to him the substance of what had lately taken place at Mr. Greer's house, when he said: "Vallandigham is crazy. He thinks that he is a martyr, and it has turned his head." He continued, in substance: "The convention should be deferred to the latest possible day. If our armies should be successful meanwhile, notwithstanding the great obstacles they have to contend with, the credit will be due to the President, and not to his advisers. Then he should have no opposition, but be permitted to settle the troubles in his own way. If not, then McClellan should run upon a platform favoring a more vigorous, systematic, and honest prosecution of the war to an early peace through crushing the rebellion and reestablishing the old Union."

Some weeks later, in a conversation with General McClellan, I stated to him Mr. Johnson's remarks to me, and that I thoroughly coincided with them. He assented to them, but said at the same time that he believed that the committee were intent upon calling the convention in July. I thought that at least two months too early, and he apparently concurred.

Later on, and after the terrible battles of the Wilderness, to my knowledge several of McClellan's friends in the army wrote him begging him not to accept a nomination unless circumstances occurred later that would make his success at least probable. One of these letters was written by General Hancock, whose name ranks among the greatest of the heroes of our war. That letter I conveyed from his hand to General McClellan. On reading it the latter expressed much feeling regarding both the writer and the contents of the letter, and asked me to see my lifelong friend Augustus Schell, and bring him that evening to S. L. M. Barlow's house on Madison Square. I did so. The general, Mr. Barlow, Mr. Schell, and myself spent the entire evening in discussing the best means of meeting the issue, he (McClellan) producing several similar letters that he had received from army officers in the field. The result of this was that Messrs. Schell and Barlow took it upon themselves to see as many of the members of the committee as possible, and write others urging that the convention should not be held until the middle of September.

At this prolonged interview at Mr. Barlow's house it was determined that every possible means should be

used to keep Vallandigham and his cohorts in the background as much as possible. That effort was continued, on the part of McClellan's friends, to the end of the campaign. It was thought by both the general and his friends that his letter of acceptance, repudiating the platform by modifying it, would have that effect, but it did not. They seemed determined to follow the principle of rule or ruin, and did so, much to the disgust of General McClellan and his loyal friends, who now think it hard at this late day to have his and their honest and loyal action attributed to "rebel emissaries in Canada."

HARTFORD, CONN.

D. C. Birdsall.

II.—PRESIDENT AND VICE-PRESIDENT FROM THE SAME STATE.

REFERRING to the work of the Cleveland convention in nominating General Frémont and John Cochrane, the authors of the "Life of Lincoln," on page 286 of the JUNE CENTURY, make the following statement:

"No one present seemed to have any recollection of the provision of the Constitution which forbids both of these officers being taken from the same State."

This is manifestly an oversight. The Constitution makes no provisions for national conventions for the nomination of candidates for the Presidency and Vice-Presidency of the United States; nor does it make any such prohibition as is implied in the statement quoted. But Article XII. of the Amendments reads: "The electors shall meet in their respective States and vote by ballot for President and Vice-President, one of whom, at least, shall not be an inhabitant of the same State with themselves," etc.

This does not forbid the choosing of both President and Vice-President from the same State; for if all the electors of the several States had cast their votes for General Frémont for President, and the electors of all the States except New York had cast their votes for General Cochrane for Vice-President, both men would have been elected in accordance with the provisions of the Constitution.

BRIC-À-BRAC.

A Valentine.

IF only I might sing
Like birds in spring —
Robin, or thrush, or wren,
In grove or glen;

If only I might suit
To harp or lute,
To chime in tender time
Some touching rhyme,—

Then I'd not hope in vain
Thine ear to gain;
But now — I halt — I quail —
Ah! must I fail?

So small my skill to plead
My earnest need,
Love — love is all the plea
I bring to thee.

Clinton Scollard.

My Grandmother's Turkey-tail Fan.

It owned not the color that vanity dons
Or slender wits choose for display;
Its beautiful tint was a delicate bronze,
A brown softly blended with gray.
From her waist to her chin, spreading out without
break,

'T was built on a generous plan:
The pride of the forest was slaughtered to make
My grandmother's turkey-tail fan.

For common occasions it never was meant:
In a chest between two silken cloths
'T was kept safely hidden with careful intent
In camphor to keep out the moths.
'T was famed far and wide through the whole coun-
try-side,

From Beersheba e'en unto Dan;
And often at meeting with envy 't was eyed,
My grandmother's turkey-tail fan.

Camp-meetings, indeed, were its chiefest delight.
Like a crook unto sheep gone astray
It beckoned backsliders to re-seek the right,
And exhorted the sinners to pray.
It always beat time when the choir went wrong,
In psalmody leading the van.
Old Hundred, I know, was its favorite song —
My grandmother's turkey-tail fan.

A fig for the fans that are made nowadays,
Suited only to frivolous mirth!
A different thing was the fan that I praise,
Yet it scorned not the good things of earth.
At bees and at quiltings 't was aye to be seen;
The best of the gossip began
When in at the doorway had entered serene
My grandmother's turkey-tail fan.

Tradition relates of it wonderful tales.
Its handle of leather was buff.
Though shorn of its glory, e'en now it exhales
An odor of hymn-books and snuff.
Its primeval grace, if you like, you can trace:
'T was limned for the future to scan,
Just under a smiling gold-spectacled face,
My grandmother's turkey-tail fan.

UM! de col' win'am blowin', de ole 'oman pickin'
geese,
An' de flakes lack de fedders fills de air,
An' dese po' ole bones am shakin' wid de agy an'
rumatiz,
An' dis po' ole heart am heaby, full er care;
But down in de bottom de flowers am in bloom,
An' de mawnin'-glory laughs roun' de do',
An' de gode-vine am er-smilin' her promus' ter de
well,
Roun' de cabin by de Massysippi sho'.

Refrain: Den, oh! I 'se er-comin'! I kin hear de
worter flow —
I 'se er-comin' dough I 'se ole an' lame an' po',
Fur dere 's nuffin' lack de joy, lack de sorrer, dat I
knew,
In de cabin by de Massysippi sho'!

I 'se comin' frough de shadder, an' comin' frough de
sun,
I 'se comin' home ter lay me down ter res'
Whar' de peckerwood kin call me ebry mawnin' f'om
de bresh,
An' de mawkin'-bird kin sing what I lubs bes';
Fur down in de bottom de worter-millions waits,
An' I sees de ole ash-hopper by de do',
An' old Rube he come ter meet me, an' say "howdy"
wid 'e tail,
F'om de cabin by de Massysippi sho'.

Refrain: Den, oh! I 'se er-comin', etc.

An' when Gabul come ter call me, let 'im toot de
trumpet loud,
So dat dis po' deef ole daky's year kin hear;
Fur he 'll sholy fin' me waitin' nigh de graves ob dem
I lubed,
Er-settin' an' er-waitin' fur 'im dere;
Whar' de gode-vine am bloomin', an' de mawnin'-glory
laughs,
At de sunlight dat lays along de flo',
He 'll fin' me ready waitin' in my ole cheer, happy,
kase
I 'll be waitin' in de cabin by de sho'!

Refrain: Den, oh! I 'se er-comin', etc.

Virginia Frazer Boyle.

Tardy Wit.

A BRIGHT little man sat bemoaning the fate
Of the wit that is tardy and sparkles too late;
Of the keen repartee that is strictly one's own,
But comes into view when occasion has flown.
Oh! the ideas, apposite, bright, and sublime,
That travel like stage-coaches never on time,
So sluggish in movement, so slow in the race
That a new topic renders them quite out of place.
So the bright little man, with a serious look,
Remark'd to himself, as he opened his book,
"Of regrets that annoy a humorist's head,
The saddest is this: It might have been said!"

No. 5.

THE AUTOBIOGRAPHY OF JOSEPH JEFFERSON.

(Copyright, 1889, by JOSEPH JEFFERSON. All rights reserved.)

WITH LAURA KEENE.

THE opening of Laura Keene's theater, in September, 1857, was an important event to me. I had been engaged for the leading comedy, and it was my first appearance on the western side of the city. Miss Keene had never seen me, either on or off the stage. It was looked upon as a kind of presumption in those days for an American actor to intrude himself into a Broadway theater: the domestic article seldom aspired to anything higher than the Bowery; consequently I was regarded as something of an interloper. I am afraid I rather gloried in this, for in my youth I was confident and self-asserting; besides, there was a strong feeling among my artistic countrymen that the English managers had dealt unjustly with us, and I naturally shared in this feeling. I have since come to the conclusion that the managers do not open theaters for the purpose of injuring any one.

At all events, I was installed as the comedian at Laura Keene's theater, and opened in Colman's comedy of "The Heir at Law." One of the leading papers, in alluding to my performance, mentioned the fact that "a nervous, fidgety young man, by the name of Jefferson, appeared as *Dr. Pangloss*, into which character he infused a number of curious interpolations, occasionally using the text prepared by the author."

The critic struck the keynote of a popular dramatic error that has existed through all time, and I shall make bold just here to call attention to it. Old plays, and particularly old comedies, are filled with traditional introductions, good and bad. If an actor, in exercising his taste and judgment, presumes to leave out any of these respectable antiquities, he is,

by the conventional critic, considered sacrilegious in ignoring them. And on the other hand, if in amplifying the traditional business he introduces new material, he is thought to be equally impertinent; whereas the question as to the introduction should be whether it is good or bad, not whether it is old or new. If there is any preference it should be given to the new, which must necessarily be fresh and original, while the old is only a copy.

Laura Keene's judgment in selecting plays was singularly bad; she invariably allowed herself to be too much influenced by their literary merit or the delicacy of their treatment. If these features were prominent in any of the plays she read, her naturally refined taste would cling to them with such tenacity that no argument but the potent one of public neglect could convince her that she had been misled in producing them. I do not say that polished dialogue or delicately drawn characters are detrimental to a play—on the contrary, they assist it; but if these qualities are not coupled with a sympathetic story, containing human interest, and told in action rather than words, they seldom reach beyond the footlights.

DRAMATIC ACTION.

PERHAPS it is well to define here, to the non-professional reader, what is meant by dramatic action, as sometimes this term is mistaken for pantomime. Pantomime is action, certainly; but not necessarily dramatic action, which is the most essential element in the construction of a play. A drama will often give one no idea of its strength in the reading of it; even in rehearsal it will sometimes fail to reveal its power. I have on several occasions seen even the author of a play surprised at the exhibition of it on its first representation before an audience, he himself not being aware that his work

Copyright, 1890, by THE CENTURY CO. All rights reserved.

contained the hidden treasure, until the sympathy of the public revealed it. Sometimes the point of unexpected interest consists in the relationship between two characters, or the peculiar emphasis laid upon a single word that has been spoken in a previous act. But to illustrate more fully what I desire to explain I will take two dramatic actions, one from comedy and the other from tragedy, to set forth the subject clearly.

In one of Victorien Sardou's plays—and this gentleman is perhaps the most ingenious playwright of our time—the following incident occurs. The audience are first made fully aware that a lady in the play uses a certain kind of perfume. This is done casually, so that they do not suspect that the matter will again be brought to their notice. She abstracts some valuable papers from a cabinet, and when they are missed no one can tell who has taken them. The mystery is inexplicable. Suspicion falls upon an innocent person. The audience, who well know how the matter stands, are on tenter-hooks of anxiety, fearing that the real culprit will not be detected. When this feeling is at white heat one of the characters finds a piece of paper in the desk and is attracted to it by the perfume. He puts it to his nose, sniffs it, and as a smile of triumph steals over his face the audience, without a word being spoken, realize that the thief is detected. Observe here, too, the ingenuity of the dramatist: the audience are in the secret with him; they have seen the papers stolen; it is no news to them; but when the characters in whom they are interested become as much enlightened as they are the climax is complete.

For an illustration of this point, as applied to tragedy. After the murder of *Duncan*, *Macbeth*, standing with his wife in a dark and gloomy hall, looks at his bloody hands and apostrophizes them in these terrible words:

Will all great Neptune's ocean wash this blood
Clean from my hand? No, this my hand will rather
The multitudinous seas incarnadine,
Making the green one red.

Now there is a silence, and when he is alone there echoes through the castle a knocking at the gate. The friends of the murdered guest have come for him; and they thunder at the portals, while the blood-stained host stands as if stricken down with terror and remorse. It is not the dialogue, as powerful as it is, which strikes the audience with awe; it is simply a stage direction of the great dramatic master—a “knocking at the gate.” It will, I think, be seen by these two illustrations that a fluent and imaginative writer may construct plots, create characters, and compose exquisite verse, and yet not succeed as a playwright unless he

possesses the art or gift of creating dramatic action.

As an actress and manager Laura Keene was both industrious and talented. If she could have afforded it, no expense would have been spared in the production of her plays; but theatrical matters were at a low ebb during the early part of her career, and the panic of 1857 was almost fatal to her. In the midst of financial difficulties she displayed great taste and judgment in making cheap articles look like expensive ones, and both in her stage setting and costumes exhibited the most skillful and effective economy. She was a high-mettled lady, and could be alarmingly imperious to her subjects with but little trouble.

“OUR AMERICAN COUSIN.”

DURING the season of 1858–59 Miss Keene produced Tom Taylor's play of “Our American Cousin,” and as its success was remarkable and some noteworthy occurrences took place in connection with it, a record of its career will perhaps be interesting. The play had been submitted by Mr. Taylor's agent to another theater, but the management failing to see anything striking in it, an adverse judgment was passed and the comedy rejected. It was next offered to Laura Keene, who also thought but little of the play, which remained neglected upon her desk for some time; but it so chanced that the business manager of the theater, Mr. John Lutz, in turning over the leaves fancied that he detected something in the play of a novel character. Here was a rough man, having no dramatic experience, but gifted with keen, practical sense, who discovered at a glance an effective play, the merits of which had escaped the vigilance of older and, one would have supposed, better judges. He gave me the play to read. While it possessed but little literary merit, there was a fresh, breezy atmosphere about the characters and the story that attracted me very much. I saw, too, the chance of making a strong character of the leading part, and so I was quite selfish enough to recommend the play for production.

The reading took place in the greenroom, at which the ladies and gentlemen of the company were assembled, and many furtive glances were cast at Mr. Couldock and myself as the strength of *Abel Murcott* and *Asa Trenchard* were revealed. Poor Sothern sat in the corner, looking quite disconsolate, fearing that there was nothing in the play that would suit him; and as the dismal lines of *Dundreary* were read he glanced over at me with a forlorn expression, as much as to say, “I am cast for that dreadful part,” little dreaming that the character of the imbecile lord would turn out to be the stepping-

stone of his fortune. The success of the play proved the turning-point in the career of three persons—Laura Keane, Sothorn, and myself.

As the treasury began to fill, Miss Keane began to twinkle with little brilliants; gradually her splendor increased, until at the end of three months she was ablaze with diamonds. Whether these were new additions to her impoverished stock of jewelry, or the return of old friends that

had been parted with in adversity,—old friends generally leave us under these circumstances,—I cannot say, but possibly the latter.

The dramatic situation that struck me as the most important one in this play was the love scene in the opening of the last act. It was altogether fresh, original, and perfectly natural, and I notice that in this important phase of dramatic composition authors are conspicuously weak.

E. A. SOTHERN AS "LORD DUNDREARY" IN "OUR AMERICAN COUSIN." (FROM A PHOTOGRAPH BY SARONY.)

The love scenes in most all of our modern plays are badly constructed. In the English dramas they are sentimental and insipid, being filled with either flowery nonsense or an extravagance bordering upon burlesque; while the love scenes in the French plays are coarse and disgusting. Sardou has written but few female characters for whom one can feel the slightest respect. For instance, which one would a man select to be his mother were he compelled to make a choice? I think it would puzzle

him. The love scenes between *Alfred Evelyn* and *Clara Douglas*, in Bulwer's play of "Money," are stilted, unnatural, and cold. The passages intended to display affection in the "Lady of Lyons" are still further from "imitating humanity," and the speech of *Claude* to *Pauline*, beginning with

A deep vale shut out by alpine hills,
is so glaringly absurd that the audience invariably smile at the delivery of this soft extrava-

gance. The greatest love scene that ever was or ever will be written is known as the balcony scene in "Romeo and Juliet." This is a perfect model, being full of the most exquisite humor.

Natural love off the stage is almost invariably humorous, even comic—not to the lovers' minds; oh, no! 'Tis serious business to them, and that is just what makes it so delightful to look at. The third party, when there is one, enjoys it highly. The principals do the most foolish things: the gentleman cannot make up his mind what to do with his hat or with his hands, the lady is awkward and shy, and the more they love each other the more comical they are. They say stupid things, and agree with each other before they have half done expressing an opinion.

It was the opportunity of developing this attitude of early love, particularly love at first sight, that attracted me to the "Cousin." Simple and trifling as it looks, Mr. Tom Taylor never drew a finer dramatic picture. The relation between the two characters was perfectly original. A shrewd, keen Yankee boy of twenty-five falls in love at first sight with a simple, loving, English dairymaid of eighteen. She innocently sits on the bench, close beside him; he is fascinated and draws closer to her; she raises her eyes in innocent wonder at this, and he glides gently to the farthest end of the bench. He never tells her of his love, nor does she in the faintest manner suggest her affection for him; and though they persistently talk of other things, you see plainly how deeply they are in love. He relates the story of his uncle's death in America, and during this recital asks her permission to smoke a cigar. With apparent carelessness he takes out a paper, a will made in his favor by the old man, which document disinherits the girl; with this he lights his cigar, thereby destroying his rights and resigning them to her. The situation is strained, certainly, but it is very effective, and an audience will always pardon a slight extravagance if it charms while it surprises them. The cast was an exceedingly strong one—Laura Keane as the refined, rural belle, and Sara Stevens as the modest, loving, English dairymaid. Both looked and acted the parts perfectly. The *Abel Murcott* of Mr. Coudock was a gem, and the extravagant force and humor of Mr. Sothorn's *Dundreary*, the fame of which afterwards resounded all over the English-speaking world, is too well known to need any comment, except perhaps to mention one or two matters connected with it of a curious nature.

As I have before said, Sothorn was much dejected at being compelled to play the part. He said he could do nothing with it, and certainly for the first two weeks it was a dull effort, and produced but little effect. So in despair he began

to introduce extravagant business into his character, skipping about the stage, stammering and sneezing, and, in short, doing all he could to attract and distract the attention of the audience. To the surprise of every one, himself included, these antics, intended by him to injure the character, were received by the audience with delight. He was a shrewd man as well as an effective actor, and he saw at a glance that accident had revealed to him a golden opportunity. He took advantage of it, and with cautious steps increased his speed, feeling the ground well under him as he proceeded. Before the first month was over he stood side by side with any other character in the play; and at the end of the run he was, in my opinion, considerably in advance of us all. And his success in London, in the same character, fully attests, whatever may be said to the contrary, that as an extravagant, eccentric comedian in the modern range of comedy he was quite without a rival. His performance of *Sam* which I saw at the Haymarket Theater, in London, was a still finer piece of acting than his *Dundreary*. It was equally strong, and had the advantage of the other in not being overdrawn or extravagant.

A THEATRICAL QUARREL.

MISS KEENE was undoubtedly delighted at Sothorn's rising fame. I think she found that I was becoming too strong to manage, and naturally felt that his success in rivaling mine would answer as a curb, and so enable her to drive me with more ease and a tighter rein. I don't blame her for this: as an actor has a right to protect himself against the tyranny of a manager, the manager has an equal right to guard the discipline of the theater; and I have no doubt that I perhaps unconsciously exhibited a confidence in my growing strength that made her a little apprehensive lest I should try to manage her. In this she did me an injustice, which I am happy to say in after years the lady acknowledged. The first rupture between us came about somewhat in this way: The Duchess—as she was familiarly called by the actors, on the sly—had arranged some new business with Mr. Sothorn, neglecting to inform me of it. I got the regular cue for entering, and as I came upon the stage I naturally, but unintentionally, interrupted their preconceived arrangements. This threw matters into a confusion which was quite apparent to the audience. Miss Keene, not stopping to consider that I had been kept in ignorance of her plan and that the fault was hers and not mine, turned suddenly on me, and speaking out so loudly and plainly that most of the audience could hear her, said, "Go off the stage, sir, till you get your cue for entering."

DRAWN FROM A LITHOGRAPH LENT BY THOMAS J. M'KEE.

Laura Keane

I was thunderstruck. There was a dead silence for a moment, and in the same tone and with the same manner she had spoken to me, I replied:

"It has been given, and I will not retire."

We were both wrong. No actor has a right to show up to the audience an accident or a fault committed on the stage, or intrude upon them one's personal misunderstandings. As two wrongs cannot make a right, it was clearly my duty to pass this by, so far as any public display of my temper was concerned, and then

demand an explanation and an apology from her when the play was over. But

Who can be wise, amazed, temperate and furious, Loyal and neutral, in a moment?

Besides, I felt that no explanation of hers could set me right with the audience, and I was smarting under the injustice of her making me appear responsible for her own fault.

When the curtain fell she was furious, and turning on me with flashing eyes and an imperious air discharged me then and there. I

might leave now if I liked, and she would dismiss the audience rather than submit to such a public insult. I told her that if she considered my conduct an insult to her, that it was a confession that she had insulted me first, as my words and manner were but a reflection of her own. This sort of logic only made matters worse. So I informed her that I could not take a discharge given in the heat of temper, and would remain. The play proceeded, but she was singularly adroit, and by her manner in turning her back on me through an entire scene, and assuming an air of injured innocence, undoubtedly made the audience believe that I was a cruel wretch to insult her in so public a way. She had the advantage of me all through, for when her temper was shown to me the play was proceeding, and I dare say that in the bustle and confusion of the scene very few of the audience could understand what she had done; whereas when I retaliated there had been a pause, and they got the full force of what I said.

When an actor shows his temper upon the stage the audience feel insulted that they should be called upon to sympathize with his private quarrels. The actor is the loser, depend upon it.

CHANGES IN OLD PLAYS.

MR. RUFUS BLAKE was attached to our company during this season, but in consequence of the great success of "Our American Cousin," in which he was not cast, he had acted but little. He was a superior actor, with the disadvantage of small eyes, a fat, inexpressive face, and a heavy and unwieldy figure. There must be something in the spirit of an actor that is extremely powerful to delight an audience when he is hampered like this. Without seeming to change his face or alter the stolid look from his eyes, Mr. Blake conveyed his meaning with the most perfect effect. He was delicate and minute in his manner, which contrasted oddly enough with his ponderous form. We acted this one season together and were very good friends. On one occasion only was this harmony marred. He rated me for curtailing some of the speeches of a part in one of the old comedies. I told him that I had my own ideas in these matters, one of which was that the plays were written for a past age, that society had changed, and that it seemed to me good taste to alter the text, when it could be done without detriment, to suit the audience of the present day; particularly when the lines were coarse, and unfit for ladies and gentlemen to speak or listen to. He gave me to understand that he considered it a liberty in any young man to set himself up as an authority in such matters, and that my course was a tacit reproach to older and

better judges, and even hinted that some people did that sort of thing to make professional capital out of it. I thought this was going a little too far for friendship. I therefore told him, with little reserve, that as he had taken the liberty to censure my course, I would make bold equally, and advise him, for his own sake, to follow my example.

"THE DUCHESS."

As Laura Keene's season drew to a close she and I had buried our differences and were comparatively good friends again; so the lady was somewhat surprised to learn that I was not going to remain with her during the following season, and seemed to consider it unkind of me to withdraw from the theater after she had done so much to advance my position. This is the somewhat unjust ground that managers often take when an actor desires to go to another house. This is unreasonable, for there must come a time when it will be for the interest of one or both parties that they should part; and it would be just as wrong at one time as at another. If an actor, when the season is concluded and his obligations are at an end, sees an opportunity of increasing his salary or bettering his position by going to another establishment, it would be an injustice to himself and to those who depend upon him not to do so. And by the same reasoning, if a manager can secure better talent, at a more reasonable price, he has a perfect right to replace one actor by another, having fulfilled his engagement. I have never known any manager to hesitate in pursuing this course, unless he retained the actor as an act of charity, and then, of course, the matter is a purely personal one.

Miss Keene, taking the unfair view I have alluded to, was highly incensed at my proposed departure. She considered that, having been the first to bring me to New York, to her my loyalty was due, and in common gratitude I was bound not to desert the theater for the purpose, as she supposed, of joining the opposition forces. I replied that, so far as my ingratitude was concerned, I failed to see in what way she had placed me under obligations; that I presumed when she engaged me for her theater it was from a motive of professional interest, and I could scarcely think it was from any affection for me, as we had never met until the engagement was made. This kind of logic had anything but a conciliating effect. So I concluded by saying that I had no idea of casting my lot with the opposition, but that it was my intention to star. "Star! Oh, dear! Bless me! Indeed!" She did not say this, but she certainly looked it; and as she turned her eyes heavenward there was a slight elevation

W. R. BLAKE. (FROM AN ETCHING BY H. B. HALL, LENT BY THOMAS J. MCKEE.)

ter, as she did not know how else to get Mr. Blake and myself into the cast. "Very well," said I; "if that is all, tell her I will play *Bottom*, and let Mr. Blake play *Puck*." And so we parted. Of course I did not suppose that he would carry this absurd message, as Mr. Blake would have turned the scale at two hundred and fifty pounds, and looked about as much like *Puck* as he resembled a fairy queen. But, not being familiar with Shakspeare, and having no idea what the characters were like, he gave her my suggestion word for word. This put the fair lady in a high temper, and she did not speak to me for a week. But I stood on my rights and was cast for *Bottom*,

Miss Keene essaying the part of *Puck* herself. After three or four rehearsals I discovered I should fail in the part of *Bottom*, and therefore deemed it wise to make "discretion the better part of valor," and resign the character, which I did upon the condition that I might take the play of "Our American Cousin" upon a starring tour, and give the management one-half of the profits for the use of the play.

I have thought that perhaps it is scarcely in good taste that I should touch upon the little misunderstandings between myself and Miss Keene; but as these quarrels were not of a domestic or private nature, and as the public were made fully aware of them at the time, there is nothing sacred about them, and they may serve as lessons in the future to younger and as yet inexperienced actors. And then, too, Miss Keene and I were friends in after years; we had long since shaken hands and buried the hatchet—had talked and laughed over our rows and reconciliations, and had continued to get as much amusement out of the recollections as we had created trouble out of the realities.

When I returned from Australia we met again. She had lost her theater, and was traveling and starring with only partial success. Her early popularity had waned, but she battled against adversity with great courage. At last her health gave way, and she retired, but still with the clinging hope of returning to the stage again. She never did. The last letter she wrote was penned upon her death-bed and was addressed to me. She sent me an ivory

The houses were still overflowing, and there was every prospect that "Our American Cousin" would run through the season; but Miss Keene was tired of acting her part in the comedy, and was determined to take the play off and produce "A Midsummer Night's Dream," which had been in preparation for some time, and in fact was now in readiness. The management was anxious that Mr. Blake, who had been idle for some four months, should be in the cast, so that the play might contain the full strength of its expensive company.

The Duchess, being in high dudgeon with me, deputed her business manager, Mr. Lutz, to approach me on the subject of the cast, proposing that I should resign the part of *Bottom* to Mr. Blake, and at the same time requesting me to play *Puck*. This I positively refused to do. I told him plainly that Miss Keene had taken an antagonistic stand towards me, and that I felt that she would not appreciate a favor even if I might feel disposed to grant it, and would treat any concession that I should make as weakness. He said that Miss Keene had begged him to urge the mat-

ter, as she did not know how else to get Mr. Blake and myself into the cast. "Very well," said I; "if that is all, tell her I will play *Bottom*, and let Mr. Blake play *Puck*." And so we parted. Of course I did not suppose that he would carry this absurd message, as Mr. Blake would have turned the scale at two hundred and fifty pounds, and looked about as much like *Puck* as he resembled a fairy queen. But, not being familiar with Shakspeare, and having no idea what the characters were like, he gave her my suggestion word for word. This put the fair lady in a high temper, and she did not speak to me for a week. But I stood on my rights and was cast for *Bottom*,

miniature of Madame Vestris, and a water-color drawing, by Hardy, of Edmund Kean as *Richard III.* Her letter was cheerful and full of hope; she spoke of feeling better, and seemed confident that in a few months she would be in harness again. She died the day after this was written.

She was esteemed a great beauty in her youth; and even afterwards her rich and luxuriant auburn hair, clear complexion, and deep chestnut eyes, full of expression, were greatly praised; but to me it was her style and carriage that commanded admiration, and it was this quality that won her audience. She had, too, the rare power of varying her manner, assuming the rustic walk of a milkmaid or the dignified grace of a queen. In the drama of "The Sea of Ice" she displayed this versatile quality to its fullest extent. In the prologue she played the mother, in which her quiet and refined bearing told of a sad life; in the next act, the daughter, a girl who had been brought up by savages, and who came bounding upon the stage with the wild grace of a startled doe. In the last act she is supposed to have been sent to Paris and there educated. In this phase of the character she exhibited the wonderful art of showing the fire of the wild Indian girl through the culture of the French lady. I have never seen this transparency more perfectly acted.

Laura Keene was in private life high tempered and imperious, but she had a good heart and was very charitable. I never heard her speak ill of any one but herself; and this she would sometimes do with a grim humor that was very entertaining.

THE WINTER GARDEN, "CALEB PLUMMER," ETC.

My starring venture was attended with what is termed questionable success, though not with what could be boldly called a failure; still I felt that the time had not yet arrived for the continuance of such a rash departure. Just at this juncture William Stuart made me an offer of an engagement at his new theater, the Winter Garden, which place was to be under the direction of Dion Boucicault. I accepted the offer, at a much larger salary than I had ever received, and was enrolled as a member of the company. The title of "Winter Garden" had been adopted from a place of amusement in Paris, where plays were acted in a kind of conservatory filled with tropical plants. If I remember rightly, the treasury of the management was not in what could be called an overflowing condition; and although the actors whom they engaged were quite strong, the horticultural display was comparatively weak.

Some sharp-pointed tropical plants of an inhospitable and sticky character exuded their "medicinal gums" in the vestibule, and the dress circle was festooned with artificial flowers so rare that they must have been unknown to the science of botany. To give these delicate exotics a sweet and natural odor they were plentifully sprinkled with some perfume resembling closely the sweet scent of hair-oil, so that the audience as they were entering could "nose" them in the lobby. Take it altogether the theater was a failure; for, added to the meager decorations, the acoustics were inferior, and the view of the stage from the auditorium unpardonably bad. To make amends, however, for these shortcomings, Mr. Boucicault had secured a strong company; not so far as great names were concerned, but they had been carefully selected with regard to the plays that were to be produced. The opening piece was an adaptation of Dickens's "Cricket on the Hearth," and called "Dot." It was a hit. The cast was as follows:

<i>John Peerybingle</i> . . .	MR. HARRY PEARSON.
<i>Caleb Plummer</i> . . .	MR. JOSEPH JEFFERSON.
<i>The Stranger</i> . . .	MR. A. H. DAVENPORT.
<i>Tackleton</i> . . .	MR. T. B. JOHNSON.
<i>Dot</i> . . .	MISS AGNES ROBERTSON.
<i>May Fielding</i> . . .	MRS. J. H. ALLEN.
<i>Bertie</i> . . .	MISS SARA STEVENS.
<i>Tillie Slowboy</i> . . .	MRS. JOHN WOOD.
<i>Mrs. Fielding</i> . . .	MRS. BLAKE.

The four first-named ladies were the pictures of female grace and beauty. This season I acted *Newman Noggs*, *Caleb Plummer*, *Salem Scudder*, and several other characters; but the latter were not very important.

Previous to the commencement of the season, Mr. Boucicault and I had some conversation in relation to the opening bill. I told him I was rather apprehensive of my hitting the part of *Caleb Plummer*, as I had never acted a character requiring pathos, and, with the exception of the love scene in "Our American Cousin," as yet had not spoken a serious line upon the stage. He seemed to have more confidence in my powers than I had, and insisted that I could act the part with success. I agreed therefore to open in *Caleb* with the understanding that I should finish the performance with a farce, so in the event of my failing in the first piece, I might save my reputation in the last. He assented to the arrangement, but warned me, however, that I would regret it; and he was right, for when the curtain fell upon "Dot," I should have much preferred not to have acted in the farce. So the little piece was taken off after the first night, as I was quite satisfied with *Caleb* alone.

JOSEPH JEFFERSON AS "NEWMAN NOGGS" IN "NICHOLAS NICKLEBY."

I RECEIVE GOOD ADVICE.

AN incident occurred during the first rehearsal of "Dot" that may be worth relating, as it bears upon a theory in acting that I have established for myself ever since it took place. Mr. Boucicault, I think, understood me, and felt from what I had said to him on previous occasions that I was not averse to suggestions in the dramatic art, and was in the habit of listening to advice, though I always reserved to myself the right of acting on my own judgment as to whether the proffered counsel was good or bad. During my rehearsal of the first scene, which I went through just as I intended acting it at night, I saw by his manner that he was disappointed with my rendering of the part, and I asked him what was the matter. He replied, "If that is the way you intend to act the part I do not wonder you were afraid to undertake it." This was a crushing blow to a young man from one older in years and experience; but feeling that there was something to learn, I asked him to explain what he meant. "Why, you have acted your last scene first; if you begin in that solemn strain you have nothing left for the end of the play." This was his remark, or words to the same effect; and I am certainly indebted to him, through this advice, for whatever success I achieved in the part.

I am not sure whether Mr. Boucicault was aware of what a large field for dramatic thought he opened up, and if I did not clearly understand the importance of it then, I have found it out since, and so far as I have been able applied it as a general rule. These reflections taught me never to anticipate a strong effect; in fact, to lead your audience by your manner, so that they shall scarcely suspect the character capable of such emotion; then, when some sudden blow has fallen, the terrible shock prepares the audience for a new and striking phase in the character: they feel that through these new conditions you would naturally exhibit the passion which till then was not suspected.

"THE OCTOROON."

RISE young actors usually guard their positions with a jealous eye, and, as I was no exception to this rule, it had been clearly understood between myself and the management that my name should be as prominently set before the public as that of any other member of the company. This agreement was not carried out; for on the announcement in the papers of the play of "The Octoroon" my name did not appear. I was to act one of the principal parts in the drama. I felt that I was something of a

favorite with the public, and naturally became irate at this indignity; so I sent my part, *Salem Scudder*, to the theater, with a note to Mr. Stuart, saying that I considered my engagement canceled by my name being publicly ignored in the announcement of the play, and I concluded my resignation by saying that, as I had no wish to distress the management, if Mr. Stuart or Mr. Boucicault would call on me I would be pleased to enter into a new engagement with them where my claims should be written out to prevent any further misunderstanding; otherwise I must decline to act again in the theater. As the play was ready and to be acted on the following Monday night, this being Saturday, I felt pretty sure that my note of resignation would act as a bombshell and explode with considerable force in the managerial office. And it did.

But I must now digress in order to show the sequel of the story. I had been for some time suffering with an attack of dyspepsia,—not a happy condition for an actor who is quarreling with the manager,—and conceived the idea that gentle exercise in the way of boxing would relieve me. So I engaged a professor, in the shape of an old retired "champion of light-weights," to give me lessons in the manly art of self-defense for the sum of two dollars per lesson, in consideration of which he was to allow me to pommel him over the head with soft gloves *ad libitum*. In our contract it was understood that I was the party of the first part, and the party of the second part agreed, never, under any consideration, to counter on the party of the first part. These lessons had been going on in my drawing-room—my teacher coming to the house—for several weeks, and I fancied that I was improving; certainly I was, so far as hitting-out went, for, as I observed before, according to the contract I had it all my own way.

On the occasion I am now about to describe I had been perhaps taking unwarranted liberties with the "champion," who must have got a little excited, for before I knew where I was I found myself stretched full length under the piano. I expostulated with him, informing him solemnly that this was the second breach of contract I had suffered from him during the last two days, and begged him in the future to subdue the old war-horse within him. In fact, I said that I would prefer to pay a little extra if he would conform to the contract more rigidly. We shook hands and began work again. My feelings were hurt, to say the least of it, and I was determined to get even with him. I now began to dance around my adversary in the conventional style, and had just given him "one for his nob," when looking over his shoulders I discovered the amazed

faces of Dion Boucicault and William Stuart. Against the dark background of the room the two heads of these gentlemen loomed up like another pair of boxing-gloves. They stood aghast at the scene, and I fancy it must have naturally entered their minds that I had invited them up to settle our difficulties by an appeal to science, and had secured the services of a professional bruiser to assist me. But the record of these gentlemen, like my own, proves that we are, pugilistically speaking, men of peace; so if they had any doubt, their alarm was soon set at rest by my dismissing the light-weight and politely begging them to be seated.

We soon came to a more explicit understanding, and the matter was settled without any reference to the "Marquis of Queensberry." The truth of the matter is that they were very anxious for me to act the part, and I was equally anxious to play it. With these feelings underlying the difficulty there was no occasion for arbitration. The quarrels between manager and actor are never very serious. As with loving couples, the slightest advance on either side soon brings about a reconciliation.

The history of "The Octoroon" is well known. It dealt with the one absorbing subject of slavery, and was produced at a dangerous time. The slightest allusion to this now-

JOSEPH JEFFERSON AS "SALEM SCUDDER" IN "THE OCTOROON."

banished institution only served to inflame the country, which was already at a white heat. A drama told so well had a great effect on the audience, for there was at this time a divided feeling in New York with regard to the coming struggle. Some were in favor of war, others thought it best to delay, and, if possible, avert it; and it was deemed unwise, if not culpable, by many for us to act "The Octoroon" at such a time. Then there were various opinions as to which way the play leaned—whether it was Northern or Southern in its sympathy. The truth of the matter is, it was non-committal. The dialogue and characters of the play made one feel for the South, but the action proclaimed against slavery, and called loudly for its abolition. When the old negro, just before the slave sale, calls his colored "bredrin" around him and tells them they must look their best so as to bring a good price for the "missis,"

and then falling on his knees asks a blessing on the family who had been so kind to them, the language drew further sympathy for the loving hearts of the South; but when they felt by the action of the play that the old darkey who had made them weep was a slave, they became abolitionists to a man.

When *Zoe*, the loving octoroon, is offered to the highest bidder, and a warm-hearted Southern girl offers all her fortune to buy *Zoe* and release her from the threatened bondage awaiting her, the audience cheered for the South; but when again the action revealed that she could be bartered for, and was bought and sold, they cheered for the North as plainly as though they had said, "Down with slavery." This reveals at once how the power of dramatic action overwhelms the comparative impotency of the dialogue.

(To be continued.)

Joseph Jefferson.

HOW ONE WINTER CAME IN THE LAKE REGION.

FOR weeks and weeks the autumn world stood still,
Clothed in the shadow of a smoky haze;
The fields were dead, the wind had lost its will;
And all the lands were hushed by wood and hill,
In those gray, withered days.

Behind a mist the bleary sun rose and set,
At night the moon would nestle in a cloud;
The fisherman, a ghost, did cast his net;
The lake its shores forgot to chafe and fret,
And hushed its caverns loud.

Far in the smoky woods the birds were mute,
Save that from blackened tree a jay would scream,
Or far in swamps the lizard's lonesome lute
Would pipe in thirst, or by some gnarled root
The tree-toad trilled his dream.

From day to day still hushed the season's mood,
The streams staid in their runnels shrunk and dry;
Suns rose aghast by wave and shore and wood,
And all the world, with ominous silence, stood
In weird expectancy:

When one strange night the sun like blood went down,
Flooding the heavens in a ruddy hue;
Red grew the lake, the sear fields parched and brown,
Red grew the marshes where the creeks stole down,
But never a wind-breath blew.

That night I felt the winter in my veins,
A joyous tremor of the icy glow;
And woke to hear the north's wild vibrant strains,
While far and wide, by withered woods and plains,
Fast fell the driving snow.

FRIEND OLIVIA.

BY AMELIA E. BARR,

Author of "Jan Vedder's Wife," "The Border Shepherdess," "A Daughter of Fife,"
"The Bow of Orange Ribbon," etc.

IX.

THE BARON AND ANASTASIA.

"He that hateth suretiship is sure."

"For the good angel will keep him company, and his journey shall be prosperous, and he shall return safe."

"Where the devil cannot go, he sends a woman."

HAVING seen Olivia depart with Jenifer Waring, Nathaniel waited for Fox at the door of the Town Hall. He came to him with Roger and Asa, and the short, sharp parting of the four men was made in the passing. Then Fox said, "Come, Nathaniel, thou hath now no time for delay." And as they walked together to the Crown Inn, and while Nathaniel packed his saddle-bag, Fox urged upon him the necessity of an immediate journey to London.

"Thou must truly go home and get thy father's authority to act in this place, but thou must not otherwise linger a moment. It is within my knowledge that Stephen and Anastasia de Burg intend to leave England, and that at the first hour possible."

"Who has told you so, George?"

"Who? Dost thou think God has no way of speaking but through the lips of a man? I tell thee their secret chambers have been seen by me, and my ears have heard the false words they have whispered together. Ride as swiftly as the best horses can carry thee, and spare not thine own strength, for thy urgency in this matter may hinder great sorrow to thy father and mother."

"My father did a noble kindness for the love of God and kindred. I think then that God will guard him in it."

"God gives us good things with our own hands. If he wills thee to be providence to thy parents, he does thee a great honor. Dispute not with him concerning it. And take no half-word from Cromwell; stand stanchly by thy case and thou wilt win it."

"I think my father is such a man as will stand to his promise, though it bring him to ruin."

"I think that also, if this were an honest

agreement between man and man; but it is the plotting of the wicked against the merciful and righteous. And as the wind sown came out of their granary, thou must do thy part to make them reap the whirlwind. Farewell, Nathaniel." And the lofty confidence of the man's soul gave to his majestic person an authority so pronounced that Nathaniel felt it impossible either to dispute the wisdom or to doubt the result of the order given him.

So he left Kendal at a hard gallop, and as he neared the sea he began to feel the daring that the good salt wind blew into his nostrils. Then his heart burned with the injustice and bigotry he had witnessed, and he was blamelessly angry at the ingratitude which compelled him not only to take back a kindness, but also to leave the woman he loved, in her sorrow and loneliness, and undergo the annoyance and loss of a long and weariful journey. But while the sun dropped in tired splendor below the horizon, and the stars moved along the edges of the hills, and the hills grew larger in the twilight, and all nature seemed to be lying asleep in the diffused silence and dusk, he gathered strength for the task with every mile he rode. For he felt the presence of God in that communion which is the peace and power of the spirit.

It was so late when he reached Kelderby that all the household were in bed. But the baron was not asleep; he heard the gallop of Nathaniel's horse while he was a good way off, and he rose and opened the door and met his son on the threshold. The two men went into the dark house together, and for some minutes were fully occupied in getting a light and in replenishing the fire, for the nights on that bleak coast were generally chill and damp enough to warrant a blazing log.

While they were thus engaged Lady Kelder entered. She was desirous to see that Nathaniel's physical wants were attended to, but she had also an anxious curiosity about the trial. As the baron lifted himself from the hearth, and Nathaniel transferred the blaze from the brimstone-tipped pine sliver to the candle, she said:

"How went the trial, Nathaniel?"

"As Roger's enemies had preordained,

mother. They have sent him to Appleby jail."

"Indeed I see not how they could have done different. Magistrates must go upon evidence."

"They sent Asa Bevin there also."

"Like master, like man. I make no doubt Asa was equally guilty."

"Roger put human kindness before human prudence. Asa put the law of God before the commands of Judah Parke. I see no other fault in the men."

"Are you also become a Quaker?"

"I would that my religion were like theirs, heart-thorough, inside and outside alike. Roger Prideaux is a man who has a perfect heart towards God."

"A perfect heart!" ejaculated the baron, in a low voice. "A perfect heart! Oh, finest of wares!"

"And what is done with the girl? Did she give evidence against her father? If she did, I think nothing of her."

"She told the truth. She could do no less and be innocent."

"Faith! When my father was in hiding for Nonconformity, I would have bit out my tongue ere I had made his enemies as wise as myself. I would, surely! Yea, I would have misled them rather than have sent my father to prison; which indeed is mostly the same as a warrant of death."

"Olivia obeyed the desire of her father. He said to her: 'Truth can do without a lie. Do not even look one.' But I have come home in this hurry on our own special business." Then he repeated what George Fox had told him, and urged upon his father an instant attention to such writing as was necessary to enable him again to act for both.

The baron heard him with a strange restlessness. He rose before Nathaniel's message was all given, and went to the window and looked into the darksome garden. Lady Kelder's face reddened with an eager flush, and she answered promptly:

"For once a Quaker has spoken words with some wisdom in them. You had better leave at dawn, Nathaniel. I have already called Jael, and she will prepare such things as you need. There are still some hours in which you may rest and sleep."

"Mother, I will leave at once — unless my father wills to interfere no further in the matter."

Then the baron turned sharply and said: "I will go to London myself. Joan, dear heart, have my best velvet suit and my Flemish laces put up, with such other things as are necessary. I am well able for the journey, and before dawn I can be near to Lancaster."

"Odinel! Odinel! You shall not leave me. Let Nathaniel go. He did well before. He is quite sufficient."

"You are unreasonable, Joan. All day you have fretted in your heart at me. You have made constant moan for Kelderby. You have wished that you were only a man, that you might say one word to save it. Now, then, have my bag filled, for I tell you surely that with it, or without it, I will leave Kelderby for London in thirty minutes."

"Let me go with you, father."

"Nay, I will do this thing alone, going in the strength of my God, Nathaniel."

"Do you wish to go, father?"

"My wish is to stay out of the world, and 't is a cross indeed to face the strife and struggle of it again. But I fear not; for as I stood by the window I heard with my inward ear the voice I waited for, and it said: '*Go. If I send, do I ever fail thee therein?*'"

It was impossible further to gainsay by a word or a look the purpose of the man. With the rapid energy of years past by he began to select such papers as he wanted, and to count out gold for the necessities of the journey. The few words he spoke to Nathaniel about the horse he wished were so curt and positive that Lady Kelder made no more remonstrance. She saw again the masterful leader, the man who in camp or court had always stood for the rights of others, and also held his own. As he impatiently changed his chamber-gown and felt slippers for long jack-boots and a buff leather jerkin, and fastened round his shoulders the heavy cloth cloak that he had worn on many a midnight watch, Lady Kelder caught the spirit of her husband, and she hastened with willing hands the special preparations which fell naturally to her ordering.

So when the horse was brought to the door, and the baron, ready for the journey, stood by his wife's side, saying the bravest and kindest words he could find in his brave, kind heart, she answered them hopefully, keeping back tears and crowning her kiss with a tender smile. And after all the hurried parting is the best parting. 'T is doubtful if any one — even lovers — do well to prolong their sweet sorrow. Emotion is weakened by every moment of time it covers, just as water spread over the valley is shallow, but pent in one deep channel becomes a driving force.

Kelder had chosen a fleet hunter to take him the first stage of his journey, and the animal soon carried him beyond the echoes of its beating hoofs. Then Nathaniel and Lady Kelder went back to the parlor and sat down together. She was still under the influence of the baron's heroic mood, and as she sat gazing into the fire her face grew soft and loving and

her heart glowed again with the long-forgotten pride she had felt for the husband of her youth.

"Your father has taken us by storm, Nathaniel. For a long time I have not seen him so much like himself. Now pray resolve me truly if we are like to lose Kelderby. Or think you this journey may be its ransom?"

"I think that my father's journey will save Kelderby."

"But if it does, then there is this affair of the Quaker Prideaux."

"My father hath no hand in that."

"But you have. And what good is it if the fire that is quenched in the chimney be scattered about the floor? O Nathaniel! Nathaniel! if you would be wise and resign a girl who has brought you, and is only like to bring, trouble. Ill fortune is catching as the small-pox; why should you take trouble from a stranger?"

"Trouble springs not from the ground, mother, for 'man is born unto trouble, as the sparks fly upward.' But why inquire of the future? 'T is like going into a warfare for which no weapon is provided. God is a present help. And 't is easily seen that we have present ills in plenty, without forecasting those not yet here. The ingratitude of our cousin De Burg—"

"Is what I expected. Nothing grows old sooner than a kindness."

"We have never done aught but good to De Burg, and he has returned us tenfold evil."

"Well, then, to every evil-doer his evil day; and as for this Roger Prideaux—"

"He is a good man, mother. But the world likes its own, and Roger is not among the number."

"Roger, like others of the trading class who have been aggrandized by the ruin of better men than themselves, cannot let affairs too high for him alone. He must be patron to Sandys or De Burg, and now he has to eat the husk of their evil speech. And as for this saint Olivia, she is better than what is either written or called for. Her father is little indebted to her extravagant goodness."

"Nothing, not even martyrdom, could prevent Olivia speaking the plain truth. It is a necessity of her nature."

"Indeed, I think martyrdom a very poor test of truth. Men suffer half the time, not for their convictions, but to gratify their stubbornness. Nine out of ten would rather yield their lives than their tempers. That is the nature of Englishmen, as 't is the nature of English dogs. Oh! I can tell you, Nathaniel, the devil lurks often behind the Cross."

"Dear mother, as to this world the Quakers get nothing, and lose everything."

"They get their own way. Is there really anything more gratifying?"

"They are truly conscientious."

"About trivialities, yes: as to wearing of hats and speaking as no one else does, and the like; picking up the most insignificant questions with their conscience, instead of their common sense. That is their righteous way of walking over people's heads."

"'T is a way of righteous self-denial."

"Yes, and they like it. After all, Nathaniel, it is easier to deny sinful-self than righteous-self."

"We talk to no purpose, mother, and I am strangely tired."

Then they both arose, and Nathaniel gave her his arm up the dark stairs. He had a candle in one hand, but its faint light only made the thick gloom more visible and portentous. They looked like two figures in a walking sleep, and Jael peeped after them through the partly opened door with the feeling that she was seeing people in a dream.

At the same hour Anastasia sat alone in her chamber, slowly removing the rings and chains and silk and laces that enhanced her splendid beauty. There had been a late supper and much wine-drinking and gambling at De Burg that night, and she had been the gayest in the crowd. She had sung wondrously to her lute; she had danced a *galliard* with Le Tall; she had played cribbage, and won gold pieces at it; she had queened it over every heart, and charmed even her father out of his present mood of anger. But she was now alone, and she was really miserable.

"I am the greatest fool in the three kingdoms," she said bitterly, as she put the mirror at a proper angle and sat down before it. "Beauty! Yes, I have beauty, but what is it worth? Do I care if Le Tall and Chenage fight a duel about me? Nathaniel scorns me, and anything else is beyond expectation. Well, what I cannot have I will be dog enough to hinder Mistress Prideaux of—if I can. But now that I have raised the storm, shall I be able to manage it? I have already in its ordering lied myself neck-deep, and one lie breeds more, and black lies have crimson fruit. Chut! My heart surely hath the bravery to perfect its own wishes, and my little tongue never failed me yet." And she put its scarlet tip out and looked at it steadily. "'T is as good as a sword, if one knows how to use it."

Then she unlatched her shoes of red morocco, and took the pins out of her black hair, and let its waving, curling mass fall over her shoulders and bosom. The particularly picturesque disorder it assumed arrested her attention. She studied its forms for future use, and passed a ten minutes in fingering and recurling her favorite lock. Then, noticing a number of gold pieces lying loose upon the

table, she counted and put them away. They had been won from Chenage; she recalled the gleam of anger in his eyes as he paid the debt of ill chance, and she laughed softly as she dropped the money in its place.

"He thought I cheated him! Faith! I am in the selfsame mind. There is a big bill running up between Chenage and me. Shall I be forced to pay it? or will he be forced to lose it?" She rose with the query, opened a drawer, and took from it a pack of cards. With a slow intentness she shuffled them hither and thither, set some aside, and cast out others. Then she spread the others before her, and began to spell out their mysteries.

"Chenage is black with anger; he carries the trey of spades, and the nine follows him. He has a villain heart, and I'll swear to it! What is this? Prison bars, and a great change, and news from beyond seas—and tears in my own breast. That last is a lie, if all else be true. I am well used to jade Fortune's tricks, and fear none of them." Yet she flung the paper oracles at her feet, and went to bed with the shadow of her own evil divination over her.

But her sleep was not troubled by the ill fortune she had spelled out in her divining cards. Indeed she was of that class of mortals whose sleep is the sleep of pure matter, and who are very rarely visited by the winged dreams. If her soul ever wandered afar on its own business or pleasure, she knew it not. It told her nothing of what it saw. It gave her neither warning nor admonition. She shut her eyes as a tired animal does, and thought nothing of the breathing mystery behind her unconscious rest.

She awoke with the influence of the previous day upon her. The triumphs of the trial with its swift afterthought of worry and fear; the feasting and dancing and gambling; the sense of her father's deferred wrath; the sense of Le Tall's half-scornful admiration, and of the almost savage earnestness of Chenage's love and anger—these things and their various smaller aids struck her consciousness the moment it was awake to mortal questions. They did not daunt her. The bright June sunshine flooded the bed, and in its glory she lay in indolent satisfaction, gathering together the tangled ends of her affairs, and looking at them steadily in their very worst aspects.

For every day has its genius, and the genius of this day was of an anxious questioning bent. It would not suffer her to be still, so she slipped out of bed and began the business of her toilet; keeping, by unconscious preference, in the very brightest band of sunshine. And as she splashed the cold water over her arms and face and bosom, and brushed out her tangled curls, she

was busy enough with plans and projects of safety and revenge, yet not so busy as to make her negligent about her personal adornment.

Thoughts, troublesome to any woman,—angry, jealous thoughts,—went to and fro in her mind, threatening, supposing, longing, and fearing; but they did not prevent her studying the effect of her brodered hose and scarlet shoes, and putting her pretty feet in every position that gave her a good view of them. She was burning with indignation at Nathaniel, she was full of scorn for Olivia, she was sick at heart whenever she thought of Chenage, but amid the tumult of such cross and vexed passions she found time and interest to try on several petticoats before she decided that the pale blue one would show off best the snowy sweep of her long white tunic. Only a woman in such a storm of anxious feeling could have so deliberately arranged each curl and plait, pinched each ruffle of point afresh, turned every crumpled bow, studied before the mirror the flow of her garments and the exact length of step they required, and yet throughout each trivial act considered with a conscious method the best way to keep herself out of the sorrow and ruin she would gladly work for others.

When her toilet was completed she went slowly down the stairway. With her hand upon the thick black balustrade, step by step, she went down. There was a long, richly painted window behind her, and she moved in the glory of its many-tinted lights, knowing well how fair her white-robed figure, with its touches of red and blue, looked in that dim splendor of changeful color. She lingered because she hoped that Le Tall or Chenage might pass through the hall and see her; for so contradictory is a woman's vanity, that even when a man is troublesomely in love she cannot resist the opportunity to make him still more so.

However, she found the house empty of all company. Le Tall and Chenage had gone away immediately after breakfast, and De Burg had betaken himself to the meadows to watch the haymakers.

"T is a moment's peace, and I thank my stars for it," she said cheerily to the steward. "I will have a breakfast to my mind, Martin—a rustical breakfast fit for a dairymaid. Bring me fresh eggs, and new milk, and the manchet loaf of wheat flour, and a plate of cherries; and, Martin, I will have the milk in the china bowl tipped with silver, that hath the Virgin and the Child at the bottom of it. And bring me a napkin of fine diaper, and put that posy of honeysuckles near by me. Faith! I shall taste the flowers in my milk." And Martin, who delighted in serving this hand-

some, well-dressed, imperiously pleasant mistress, brought all she wished, with a hasty officiousness that bespoke his willing service.

"What time was breakfast served, Martin?"

"An hour after sun-rising, mistress—and great discontent at your absence shown."

"Who was discontented, Martin?" She was chipping the tip of an egg with the greatest deliberation, and her smile was so ravishing that if Martin had had to break every commandment to answer her, he must needs have pleased himself and have done it.

"'T was Squire Chenage the most—and the other gentleman also; and the master grumbling for himself and all."

"That was like to be. And pray what did they break their fast on?"

"I served some ribs of cold roast beef, and a dish of buttered salmon, and each a bottle of sack; also the wormwood wine at the first of all."

"They would need the wormwood. I bless myself that I was absent from the discontented gentlemen. For I dearly love a simple meal, Martin. Faith! I think I have the innocent tastes of a child yet. Cherries and milk are my delight." And she lifted admiringly a bunch of the crimson drupes and laid them with anticipative enjoyment against her crimson lips.

On the whole she had a pleasant meal, and when it was over she found herself able to face the day; nay, rather anxious for such encounters as it might bring her. But nothing followed on her "Come what may, I am ready for it." Fate was out of hearing, and her challenge was for some hours unanswered. She found it difficult to fill them to her satisfaction. To be alone, that was a condition of *ennui* and weariness to her. She tried playing shuttlecock, but there was no one to see her pretty attitudes, and it disarranged her dress. Then she practiced the new French step taught her the previous night by Le Tall, and as she watched her scarlet shoes playing hide and seek behind and before her petticoat, she bethought her of Sir John Suckling's ballad, and so, quoting it, made the words keep the rhythm of her motions:

Her feet beneath her petticoat
Like little mice stole in and out,
As if they feared the light;
But, oh! she dances such a way,
No sun upon an Easter day
Is half so fine a sight!

In a little while she wearied of her dancing and took a book. But having no liking for reading, and the volume lifted proving to be Alsted's "Encyclopedia," she soon laid it down with the impatient comment:

"'T is the veriest nonsense, I believe. If the bell has any sides, the clapper will find them; and if there was any savor of sense in the book, 't is to be believed I should hit upon something worth the reading."

Then she took her finery and her pretty, gracious ways to the housekeeper, and asked what sweet waters were making in the still-room, and discoursed about the excellence of elderflower pomade for the skin, and even condescended to inquire as to the dishes for the day's dinner.

But all this was but a trifling with Fate, and exceedingly unsatisfactory. She had set herself to a certain high mental pitch anticipating a battle royal with her father, and possibly with Chenage; and she felt that there was an unfortunate want of communication between her mood and its objects. As the morning and the long, hot afternoon crept slowly away, her spirit flagged; she grew fearful in the crowding thoughts that assailed her; she began to feel as if something were going to happen.

It was night, however, before the slightest change came. She had taken dinner and was lying on a sofa, idly touching the strings of her lute. A song, "To the Virgins, to make much of Time," with the notes attached, was beside her; and she was singing it with a very listless air:

Gather ye rosebuds while ye may,
Old Time is still a-flying,
And this same flower, that smiles to-day,
To-morrow will be dying.

De Burg entered at the third line. He was rating the servant who followed him about some household neglect, and he continued the occupation while the man took off his heavy riding-boots and clasped on his feet shoes of more light and easy make. He did not notice Anastasia, and she continued her melancholy song, but with such a nervous hand that at the word "dying" a string snapped with a sharpness that had something ominous in it. Then she laid down the lute, rose from the sofa, and arranged her skirts with such elaborate care that the petty interest irritated De Burg; and he broke in two a brutal epithet he was bestowing upon the servant, in order to turn round and say:

"Shake your bravery less, mistress; you set my teeth on edge."

She answered him by a shrug of her shoulders, and an inquiring stare which he felt but would not see. Then softly humming the refrain of her interrupted ditty she went hither and thither in the darksome room; shutting a casement, putting the encyclopedia in its place, re-arranging the honeysuckles in their

bowl—aggravatingly indifferent to all but the trifles that caught her passing glance, and quite conscious that the trailing of her silk and lawn, and the unconcerned, meaningless repetition of “Gather-ye-rose-buds—Gather-ye-rose-buds—Gather-ye-rose-buds” was exasperating her father to the highest degree.

“Light the candles, Jock.”

The man was leaving the room, but he turned back to obey her command; and in the interval she walked about with her hands clasped behind her back, and her head lifted high to the thoughts gradually gathering passion in her angry, fearful heart. But she still hid all emotion in fitful bars of the same mournful melody: “To-morrow-will-be-dying—To-morrow-will-be-dying—To—”

The closing of the door broke the word in two, and the sharp clash was followed in a moment by an order just as sharp:

“Come here, Asia!”

She went towards him, and stood by the small table holding the two candles. One of her hands rested on it; she was erect and watchful, yet withal conscious of that unconquerable fear which is the result of a lifelong habit of obedience, founded upon traditions of absolute right.

“Asia! you have brewed a pretty kettle of broth for me. I shall need the devil’s spoon to sup it with.”

“He is always willing to lend it.”

“To a woman, yes. But I am not going to sup the broth. No, in faith! They who brewed may borrow. I tell you, Kendal is in a fever of discontent about yesterday’s work.”

“The Kendal Quakers, you mean?”

“I mean such men as young Strickland, who holds Quakers and Puritans and Royalists, all of them, at his word. He met me in Stricklandgate this afternoon, and refused me his hand on this business. He said, moreover, that I had been false to my kindred, and false to my king, and false to my honor; and that he would prove every charge at his sword’s point; and listen, mistress! Captain Bellingham stood by him! Heaven and hell!” he shouted, as he rose and stamped his foot to the adjuration, “I’ll strangle both; yes, both of them with their own blood.”

“Playing ‘Pistol’ won’t mend matters, sir. Try to understand yourself, and be reasonable. ’T is beyond doubt you have been false to Kelder, and intend yet more of the same business. ’T is beyond doubt that men will say you wrong your own honor in wronging Kelder’s surety for it; but wherein you have been false to the king, I see not. On that quarrel you may stand firmly.”

“Oh, indeed! You see with one eye, and I was so great a fool as to let you see for me.

The main count of Strickland’s charge is, that I have been a traitor to King Charles in that I interfered with his messenger.”

“’T was against Prideaux, and not against Sandys, you moved. A fine thing when nobles like Strickland stand up for Quakers!”

“Confusion to it all! See you not that if Sandys went to Penrith, he went there only to see one great lord, who must now lie under still heavier suspicions. And Prideaux, though a Quaker serving the king’s purpose, is a loyal man in Strickland’s eyes. He said plainly to me that an injury to men doing the king’s work secretly was a wrong to the king beyond pardon. Fool! fool! I never thought of the matter in that light. And ’t was a beggarly return to Kelder for his kindness—all to serve a woman’s jealous spite. Fool! fool! fool!”

“You know best what name fits you, sir; but ’t was not specially to serve my spite. ’T was because you had not humility to say, ‘Thank you very kindly, *sir*,’ to your cousin Kelder; and because you grudged Sandys to the Quaker Prideaux, and hoped to work him out of the estate, and so make room for De Burg. Pray be so far honest with me. I shall think no worse of you for it.”

“As to Harald Sandys, ’t was the most unfortunate of names.”

“Then they think surely it was Sandys?”

“They would swear it, for ’t is their desire. Sandys and Strickland have been friends for generations, and Bellingham has with Sandys still closer ties. See you not, then, how I have offended them both in their personal and political affections? And who would care to live in Kendal with Strickland and Bellingham for enemies? As well live in Rome, and strive with the Pope.”

“Tell them the truth, if you think it needful.”

“Tell them that an honorable name like Sandys was used to shield a villain like John—they would either of them stab me with the words in my mouth; and, by my soul! ’t would serve me right.”

He was walking the floor in a fury of distracted passions, and Anastasia, white with physical terror, watched him with a sense of hopelessness of which she had never before been conscious. What could she do or say to undo what she had said and done? Nothing. And as for all her personal enchantments, in that hour she learned how impotent they were against the impregnable principles of honor and gratitude and inflexible justice. The defection of Bellingham smote her on every side. She had believed her influence over him to be absolute. She could scarcely credit his desertion until she remembered that he had not called to see her after he heard of Prideaux’s prose-

cution. She feared Chenage; she liked the gay-hearted Bellingham, and had always regarded him as the final resort if her circumstances became beyond her own management. To lose his love was to lose her anchor; she had the sense of drifting on stormy waves, rolling hither and thither to the passionate bluster of De Burg's anger and mortification.

"Only one course is now left, Asia."

"To go to the king?"

"Yes."

"I am ready at any hour."

"You! It is impossible now to take you."

She turned as if she had been suddenly struck, her face expressing the same anger and astonishment.

"What then?"

"You must marry Chenage."

"I — will — not!"

"You will! And that with all convenient speed."

A shrill cry smote her lips apart. "Father! father! hear me!"

"I have heard you to my ruin."

"Let me go with you. I will bear anything, everything." She stepped to his side and laid her head against his breast. Her distress was real and he felt it; but he had no comfort to give her. Not unkindly, but with a positive firmness, he withdrew himself from her embrace.

"Asia, meet your fate like a brave woman. You have called it unto you."

"Let me at least have the reasons for my fate. Good God! how careless you are of my happiness."

"Let me tell you, when you bartered your happiness for revenge 't was your own bargain. This considered, shall I care for what you are reckless of?"

"Anything but Chenage! I fear him. I fear that gray, lonely house among the mountains. O father! I have seen my misery in his eyes. Spare me!"

"There is no other way. I must abroad at the first hour. Where am I to get the gold? Only from Chenage. I owe him much already, and he is willing to cancel all, willing to give me two hundred pounds for my expenses the day you are his wife. Fix that day now. 'T is the only favor I can grant you."

"I will not be so cruel to myself. Father! dear father!"

"You cannot kiss me out of concessions, Anastasia. The only way to save De Burg is to be before Strickland. When the king comes to his own he will have so many to right that any excuse will serve to pass some of the many by. A word from Strickland and he would take my rights, to right some other man."

"Sell the plate—sell all my jewels."

"Tell all and sundry that I am going? Set

old and young Kelder to watch my movements, and have me put under lock and key? Asia, you brewed this cup, drink as you have brewed. Chenage is as fine a gentleman as England breeds. He is rich and he loves you, and faith! you have often led him to believe that you returned his love. If you play with fire do not wonder if you get burnt."

"I shall do my best to make him wretched."

"If you try that game with Chenage you will get beat at it. I thought it was he that was to make you wretched. To say truth, 't will be six for him and half a dozen for you."

"I will run away from him, and come to you."

There was an inquiry in her eyes which De Burg could not meet. It said so plainly, "If I do, will you shelter me?" He turned to the sideboard, poured out a glass of French spirits and drank it. A few minutes of silence followed. Anastasia went to the sofa and sat down. The hopeless droop of her handsome head was but the outward sign of a far more terrible hopelessness of heart. There are possibilities for women in these days that were impossibilities two hundred years ago. Marriage was then a final act; no one regarded any divorce but that of death as either practical or potential. Flight in any direction, or for any purpose, was accompanied by dangers so various that an ordinary spirit could not contemplate it without despair. Public opinion was absolutely on the side of the worst husband. Whether the marriage ring was a chain or an ornament, society demanded from a woman all the obedience to its obligations which was promised by the very act of wearing it.

These thoughts and many like them passed through Anastasia's mind with the rapidity and vividness of a flash of lightning; and they had, as a sad accompaniment, her keen disappointment of the contemplated change. She had looked forward to the merry doings of that shabby little court in Paris with such anticipations of triumph. In her secret heart she had even planned the captivation of the laughing, quaffing, carelessly good-natured monarch. Were all her delightful day dreams to end in Squire Chenage and his great sorrowful-looking house? Desperate as the circumstances environing her were, she was resolved not to submit to them if it were possible to escape a lot so repugnant and so final.

De Burg waited for her to speak. He was determined not to weaken his ultimatum with many words. "Fix the day, and fix it at the earliest possible date," was all that he would say. His sulkiness, if she had known it, was the sign of the white feather, of a certain pity for the beautiful girl whom he was doom-
ing to a life so hateful and hopeless to her. He

felt that if he any longer permitted her to weep and plead he must in some measure give way; and so he retreated into the fortress of a sulky silence. But Anastasia was not one who looked below the surface for a motive. Her father's silence she took for the evidence of an inflexible resolution.

"Let me have this night, father. I commonly think in the night. Then, if I see your plan to be the best, I will take it of you, and let my own hopes go in God's name."

She spoke in a low, tearful voice, and he could not resist her request, though he was obliged to speak gruffly in order to keep his position intact.

"I 'll warrant you 'll come to your senses before morning, Asia. Chenage is as good a gentleman as lives, and his offer is to my great contentment. If you fall a-crying now, you shall have the room to yourself. Peace, I say!"

She shut the parlor door with a passionate force behind her, and fled like a frightened child up the dim stairway to her room. She had a quick thought of the Anastasia that passed slowly down it in the morning sunshine, and a quick pity for the Anastasia hurrying through its shadows at night, pursued by a fate pitiless and hateful which she knew would overtake her. With trembling haste she drew the large iron bolt across her own door. But she could not shut out the terror which was in her heart. For a moment she stood in the scarcely lighted room panting like a hunted creature; then she lighted several candles from the burning rush-light, and sat down somewhat quieted by the act.

With angry vehemence she tossed aside the white robe and blue silk petticoat. "I will never wear them again," she muttered. "They are full of ill luck, they are the colors of disappointment and misfortune to me. If this is the world, would I were out of it! If Chenage will have me, he shall rue it. Faith! I 'll make him wish he had never seen me. My only amusement will be to torture him. Ah, the wretched life! I wish—I wish—I wish that John would come! John would not see me wronged!"

She had been rapidly undressing to these ejaculations. The freedom given to her body seemed in some way to enlarge her mind. John's name gave her a new hope. She was now half scornful of her own submission. She thought of twenty arguments she might have used against her father's plan. Before the mirror she looked at herself and pitied the fate of her youth and beauty. But as she passed her fingers through her long curls, the new hope gradually took clearness and form in her mind.

In the hurry of their parting at Sandys John had certainly said something about "coming

back to see her in a month." Yes, she remembered the word "month." At the time the promise had not appeared to her desirable; she had passed it by with a passing assent. Now she rigidly inquired of memory for it. She endeavored to recall the tone in which it was made, the expression of John's face, the particular sentences before and following it; and her final conclusion was that John certainly intended to visit her very soon.

She could understand that his curiosity would lead him to do so. Filling his life with great and shameful tragedies, John de Burg had nevertheless that small kind of soul which is inquisitive about petty affairs. Without reflecting on the peculiarity, Anastasia knew that it existed. She knew all his small hatreds, his scornful toleration of Prideaux, his real admiration of Olivia, his jealousy of Nathaniel; she imagined the laughter and delight they would have together over the trial and sentence of Prideaux and Asa; and she came to the positive belief that within three weeks, perhaps two, John would certainly venture to meet her somewhere. Well, then, delay was all she needed.

"I 'll go with John. Yes, I 'll go with John, if he were a thousand times an outlaw, rather than with Chenage to that gloomy prison of his. But it will need management."

By "management" she meant deception. She had not that brutal courage which attains its ends by a physical storming of whatever contradicts. She preferred to cozen and smile and allure. Chenage was inclined to be suspicious and jealous; she would accept him with an appearance of grateful pleasure. She would tell him she loved him for his kindness to her father. She would fool him to the top of his bent. But she would also put off to the last possible moment the hateful ceremony which would make him lord and master, and her the obedient or rebellious slave of his wishes. And, to the last moment, she would hope and watch for John.

After a little silence she went further, though it was at first with fear and uncertainty. "And if John should *not* come in time, John will find out where I am. He will come and see me, or he will send. I know the man he will send—Pastro; I can see his short, black, curling hair, his flat cap and earrings, his red, thick bull's neck, his dark skin, his sailorly roll. He 'll hang round till he sees me; and John won't be far off—and if I am unhappy—and I know I shall be unhappy—I shall tell John; or, or, or—*Chenage might have an invitation to go with John.*"

Her face flushed, her eyes danced with delight. She flung herself upon the bed to luxuriate in such a delectable scheme of revenge. Every now and then she laughed softly to her

pillow. She might have to be gracious and humble for a little while, but oh, the rapture, the delirious rapture of her revenge!

"And I shall not blame myself," she murmured complacently; "'t will be his own fault. He has lent father money purposely for this end. Neither will I blame father. I warrant he thinks he gets me cheap at a few hundred pounds. A dear wife I will be to him! O Roger Chenage! Roger Chenage! You shall find out how sharp are a woman's secret teeth."

In a couple of hours she had quite accepted the situation; nay, she even felt a wicked exultation in it. Nor must we blame her beyond reason. The women of every age are in a measure what the age makes them. Cromwell's age was an heroic one; everything, good or bad, took on large proportions. The good women had opportunities for amazing faith, for great self-denial and magnanimous deeds; the evil women were driven by the same circumstances into vast oppositions. They did, and they suffered, gigantic wrongs; and they had all the facilities for outrageous revenges. Betrayed confidences could send men to prison or to the scaffold, a little sinful gold sell them into hopeless slavery, a planned jealousy deliver them to be spitted on a rival's sword. Anastasia, looking at her wrongs in the light of her own time, saw how she might rid herself of an unwelcome husband; kidnapping, slavery, death—these were her weapons. Had she lived A. D. 1890, she would have simply gone to the divorce court.

After she had come to a firm and clear decision she went to sleep. The thought of murder was in her heart, but she called it revenge, and it did not trouble her. Besides, she had also made an agreement with herself that if Chenage behaved properly to her father and to herself she would do him no physical harm. In that case, if she found life intolerable at Chenage Grange,—and she was sure it would be so,—she would go with John, and Chenage would only have to fume a little over his runaway bride.

He was that night in Kendal waiting for Anastasia's decision. De Burg had promised him it in the morning. And he occupied the room in the Crown Inn which Nathaniel had occupied two nights previously. Oh the secrets that the four walls of a room keep! Prayer, and anxious loving thoughts, and talks with conscience, and calm virtuous sleep; that was the record Nathaniel Kelder left on them. Chenage was under the influence of a brutal and selfish passion. His mutterings were full of hatred of De Burg. He grudged the money he had loaned; he was trying to invent some plan by which he could evade the payment of the further sum promised. When he

thought especially of Anastasia it was with mingled curses on her power over him and ejaculations on her beauty. He made himself great promises of the revenges he would take for all the heart torment she had given him and all the money she had cost him. Was this record also written there? O changing guests of inns and homes!—

May not the ancient room you sit in dwell

In separate loving souls, for joy or pain?

Nay, all its corners may be painted plain
Where heaven shows pictures of some life spent well,

Or may be stamped—a memory, all in vain—
Upon the sight of lidless eyes in hell.

The morning was a dull, rainy one. It broke austere. The wind lashed the boughs of the trees and gave them a doleful aspect, and the very sky seemed flattened under the pouring rain which drowned the horizon. But Anastasia was not affected by atmospheric influence; she had a vague passing pity for the cows browsing in the wet grass of the distant meadows, but she turned from the window to the mirror with a mind perfectly settled on her own affairs. Rain or shine, she knew the way she was going, and at the moment when she put her bare feet upon the polished oak of the floor she began to take it.

She dressed a trifle more carelessly than usual. She was not going to give herself any particular trouble about Roger Chenage. Her sacrifice was granted, but why deck it with pink bows? Otherwise there was no difference in her appearance. She met her father with a smile, and De Burg was grateful for it. He looked haggard and weary, for he had really passed an anxious and sleepless night. Truly he wanted his own way, but he wanted it without serious pain to Anastasia. So her smile was better than sunshine to him. He kissed her voluntarily, a favor so unusual that it made her cheeks flame with pleasure. She felt at that moment as if it would be a joy to use Chenage in any way necessary for the welfare of De Burg.

De Burg read her like a printed page. He perceived that in her present mood he might resign everything in order to gain everything; and, as he anticipated, she refused to accept this surrender.

"'T is not to be thought of," she answered. "I shall manage Chenage to my own purposes very well, father; and if he mistreat me, I warrant he will do so at his own peril. My only affliction is that I must lose you."

"'T will not be for long, Asia. I may promise you so much."

"And when the king comes home you will be with him, and you will send for me to London, and I shall see the new Spring Garden,

and disport myself at the court masques and balls."

"You shall, surely! You have been kind and obedient to me, Asia. When Chenage comes this morning give him the earliest day for my sake."

"A month hence?"

"Do you dream? A week hence is too late."

"'T is impossible! And surely you have some arrangements to make. Money is but the first. What conveyance have you to the coast?"

"My own horse will take me to Whitehaven bravely."

"It will not carry you across seas."

"Le Tall has a friend, whose ship is now unloading at Whitehaven, from the Barbadoes. It waits for me, and will go so far out of its course as to drop me upon French soil. And if I forget you for an hour, Asia, 't will be against my will; though for the present I must content myself with the belief that Chenage has a distracting love for you."

"The ways of love are many. Chenage will vow you black and blue that his is one of them. It will pass at that!" And she shrugged her shoulders with a scorn that words would vainly have tried to express.

"He hath a good name also. Le Tall said to me but yesterday that no merry party would willingly want him."

"I'll warrant it so. Few men care to show their private faces in public."

"And 't is a common report, among those who profess to know, that Old Noll hath not many days to live. Then we may hope —"

"I will none of Hope. She is an old gipsy, forever prophesying lies. She told me I was to go to Paris with you, and then fled away before Necessity, who sends me to Chenage, without an ah! or oh! or how! about it."

"'T is all contrary to my desire. Chenage will be here anon; I will leave you to take care of your own affairs."

"Have no fear. He shall take care of yours also. 'T is not my nature to put my father at the feet of any other man."

He was really too troubled to answer; but Anastasia understood his set white face and drooping head, and when his misty eyes flashed one look at her they touched the girl deeper than Chenage might ever hope to do. She even found a kind of pleasure in the thought that she might use Chenage to ransom her father's honor and fortune. And yet 't was but a poor pleasure, leaving behind it a bitter sense of wrong to her own life and hopes.

After De Burg left the room it seemed inexpressibly dreary, and as she walked restlessly about it a Hindu idol, upon a shelf filled with Asiatic curiosities, attracted her attention — such a melancholy, hideous, dropsied, gloomy

god, simian and obscene, with half-closed eyes and sempiternal smile. She stood musingly before it.

"'T is said that mostly women pray to it. What misery women do endure; for where that horror is the likeness of a god, conceive me what the men may be! Certainly Chenage is something better, or 't is to be hoped so. And if Chenage is my fate, I will not cross destiny, for 't is to cross my luck. But, oh, the bitterness of it! Chenage, whom I have mocked and despised! Chenage, whom I have vowed never to marry! Chenage, of all men, to open the door of my future home! 'T is beyond belief! 'T is beyond endurance!"

But Anastasia was only experiencing one of those contradictions of fortune which in all ages have been a lament. Can any man or woman say, "I will not enter a certain dwelling"? The swift changes of life may bring them to its threshold, may push them in, and they not even dream of escaping. Therefore the wise defile not any well, because they may yet have to drink of its water.

X.

A MEETING.

"O sad bride, feigning to be what thou art not! Veiling with smiles thy fears of wrong, thy dreams of quick vengeance."

"All strangest things the multitudinous years
Bring forth, and shadow from us all we know;
Falter alike great oath and steeled resolve,
And none shall say of aught, 'This may not be.'"

JENIFER WARING was a woman of sorrowful spirit; one who never sunned herself on the mountain tops of her faith. Though her Bible told her that "the earth is full of the goodness of the Lord," she preferred to think of Jehovah as a niggardly dispenser of happiness, delighting to feed his people with the bread and water of affliction. So she looked with distrust on the happy confidence which enabled Olivia to stay her heart on God. "These were days of great spiritual warfare, and she herself was thankful if she might only dip her parched corn in the vinegar. How then should a child like Olivia have the banqueting-house and the banner of Love over her?"

For Olivia's soul was a garden, Jenifer's a lonely, complaining place, and she wondered how Olivia, resting on the Lord to do all things well, could not only quiet her heart in that assurance, but also keep her tongue from reproaching those who had done her wrong. Jenifer wished to discuss all the circumstances which had brought Roger Prideaux into trouble, and her womanly instincts told her that there had been something between Anastasia and

Olivia which the examination in Kendal had not reached. She judged it concerned Nathaniel Kelder, and she enjoyed a love affair, if it did not run straight and found plenty of crosses on its crooked road. But about personal matters Olivia was exceedingly reticent, and reticence between women is an attitude capable of causing great heart-burning.

Olivia, then, did not satisfy her protector's hopes. She had looked forward to weeping with her; to a luxury of spiritual and earthly complaining which would have been better than singing to Jenifer. But Olivia's serenity and guarded speech gave her no such opportunities. She also took some credit to herself for the open confession of her opinions involved in her kindness, especially as she had decidedly crossed the wish of her more prudent husband in order to make it. Herein doubtless lay her compensation, for Justice Waring was a masterful man at home. But this was an occasion of self-assertion which could be grounded upon conscience, and the strictest domestic martinets generally find themselves unable to face a woman crossing their orders "for conscience' sake."

And Jenifer recalled frequently, and with pleasure, the face of her husband when he saw his coach standing at the door of the Town Hall and heard her say that she thought it her "duty to take charge of the young daughter of Roger Prideaux." He had not dared to oppose her lest he should be publicly resisted. Jenifer smiled when she thought of that moment.

Besides, she would have the pleasure of telling George Fox what she had done. For she gave to Fox that reverent admiration which women give to men who are lords of themselves and others; that pure feminine admiration, having in it no element of sin, because given to attributes, and only affecting the individual as the representative and interpreter of them.

It was on the morning of the fourth day after the trial that Nathaniel came for Olivia, and about noon she was ready to depart. Justice Waring's house was on the main street, but the shopkeepers were mostly in their parlors eating their dinners, and the Stricklandgate was as quiet as if it were the noon of night instead of day. Nathaniel was by the open coach with his handsome face lifted to the door of the house. For on the topmost step of the flight leading to it Mistress Waring stood, holding Olivia's hand. They made a picture worth taking into the memory; the large, comely, richly dressed matron, and the slight, fair girl with her composed manner and innocent face. Her white saracenet hood made a soft radiance round it, and the somber plainness of her dress received an air of freshness and sweetness from the roses and mignonette she carried in her hand.

There was a silk-mercier's shop adjoining the Warings' house, and as Mistress Waring stood holding Olivia's hand, and Nathaniel stood smiling and watching them, the shop door tinkled sharply, and Roger Chenage and Anastasia de Burg came out together. Anastasia had been choosing her wedding dress, and was in a temper of scoffing mirth, while Chenage, in a sulky admiration, was trying to understand her.

Just at that moment the bells began a noon-day chime, and Chenage made some reference to their wedding peal. She looked at him with contempt, and, tossing her head, saucily answered:

"A wedding peal! Nay, we will have a noise of trumpets; or, better still, the butchers shall ring us a triple major with their knives and cleavers. Sure I have heard that when the king brought home his queen the London butchers on Ludgate Hill made a pretty enough music so. I swear we will have the butchers."

"Take a care, mistress. You are going beyond my understanding."

"'T would be no hard thing to do that"; and then suddenly both her feet and her tongue received a momentary check. She saw the little tableau at Justice Waring's door, and by a glance directed the attention of Chenage to it. The sight infuriated Anastasia, and she believed it had been deliberately planned for her mortification. Yet, with a bitter laugh, she advised Chenage to study the devotion of the Puritan lover.

Chenage defended himself with a sullen justice. "When will you look at me as that girl looks at Kelder?" he asked. "By my soul! a man could catch love from her eyes."

He was swinging his feathered hat angrily, and trying to carry his finery with the air of one who knew sword and buckler; but it was hard work with Anastasia's cold eyes upon him and her sneering words in his ears.

"Fortune is a jade!" she cried; "an ill jade, or she had given me a Puritan lover. How I should adore one! How becoming is their dress! How refined and gentle their manners! They do not dice, nor drink, nor dance. Loving is their only vice, and I vow they love to perfection! That man touches the girl as if she were the Virgin Mary. He speaks to her as if he said, 'Your Majesty.' Ah, me! I would I had a Puritan lover."

She looked in his face so directly and with such glinting eyes that he knew not whether she was in jest or in earnest; in fact, she knew not herself which of the passions rioting in her heart was chief over the rest. In a few moments the coach overtook them, passed them, and so went slowly out of sight. It was open to the

sunshine and the breeze, and Olivia was its sole occupant. She sat in it like a child, with the same air of simplicity and unconsciousness. Nathaniel rode his own horse, guiding it, as Anastasia noticed, so close to Olivia's side that he could bend low enough to catch her conversation.

Olivia looked not to the right or the left; but she received in some momentary glance the knowledge that it was Chenage and Anastasia she was passing. Eyes raining evil influence were upon her; but her will of goodness was equal to Anastasia's will of wickedness, and she would not turn her face to the handsome one regarding her with such malignant authority. Nathaniel, on the contrary, looked steadfastly at the couple, and the haughty, passionate girl felt the quick pang of his penetrating, reproachful glance. She threw her head a little backward, and lifted her flowing skirt to exhibit her spangled shoes. For she was wearing her most splendid clothes, having determined during the interval of courtship to make Chenage visit her mercer and her tailor to abundant advantage. She glittered in silk and silver and gems; she moved to the nodding of plumes, and waving of lace, and flaunting of ribbons; and the fresh wind caught from her fluttering trappings the waft of lavender and precious Eastern scents. A few years later Nathaniel wondered if John Milton had been in Kendal that day, and he smiled as he opened the "Samson Agonistes" and read that question in it which so perfectly described the girl.

But who is this? What thing of sea or land?
 Female of sex it seems,
 That so bedecked, ornate, and gay,
 Comes this way, sailing
 Like a stately ship
 Of Tarsus, bound for the isles
 Of Javan or Gadire,
 With all her bravery on, and tackle trim,
 Sails filled, and streamers waving,
 Courted by all the winds that hold them play,
 An amber scent of odorous perfume
 Her harbinger.

Yet this picture, vivid as it was, took but a moment to impress itself, and even shared that moment with its companion picture — an equally bedizened man, his hair in long scented curls, his feathered beaver swinging in his hand, and his large brown face turned with insolent and sullen anger upon the young girl in the coach and the young man riding at her side.

"I shall go mad with the insolence of that

fellow," he said; for he was not oblivious of Nathaniel's glance, nor yet of the power it had over Anastasia; and as he uttered the words he dashed his beaver passionately against his right knee.

"Then you may go mad without my help. I am indifferent to the disagreeable creatures."

"I will pistol him before your face if I see your eyes on him again."

"Are you so far gone in jealousy? Ha! ha! Is your neck clothed with thunder? Do you commonly drink brandy and gunpowder, sir? Let me tell you Nathaniel Kelder hath brave blood in every vein, and it is not your hand will ever let it."

"It seemeth to me that he ought to be in my place."

"As I am convinced that you love me, I will own that he would be even more disagreeable. I have but a slim chance of ruling you. I should be a slave under Nat Kelder's will."

"Nay, then, Anastasia, you may rule me to your heart's content, I am so far gone with you. Thank your stars, my girl, that fortune has given you a husband so much your slave."

But she was far from being thankful. She was sullen and ill-natured, and indulged herself in such sarcastic speeches as made her lover explode with laughter and burn with indignation at the same moment. They called this wooing, and bandied their veiled words backward and forward with smiles and stolen kisses. But in his heart Chenage was promising himself a full indemnity after marriage, and Anastasia's eyes saw coming towards her the swift-winged ship which would bring her a perfect satisfaction and a perfect freedom. So ready a creditor is the future to the dissatisfied. It promises anything, everything; it willingly accepts mortgage after mortgage upon its unrealized happiness, and then, with sudden calamity or slow agonizing delays, forecloses on life, and turns the bankrupt heart out of home and out of hope.

At the same time Olivia and Nathaniel went slowly through the scented lanes between Kendal and Sandys. They were in no hurry. Nathaniel dismounted to gather her some bluebells, and having done so he hung his bridle over his arm and walked by the side of the coach. They talked in that low voice which lovers naturally choose, and yet their matter of conversation was nothing to such special purpose. But Love has all things, all words, all looks, all motions for his own. He can vow affection without a word, and give everything in the transfer of a glance.

FARRAGUT. (MOBILE BAY, 5TH AUGUST, 1864.)

FARRAGUT, Farragut,
Old Heart of Oak,
Daring Dave Farragut,
Thunderbolt stroke,
Watches the hoary mist
Lift from the bay,
Till his flag, glory-kissed,
Greets the young day.

Far, by gray Morgan's walls,
Looms the black fleet.
Hark, deck to rampart calls
With the drums' beat!
Buoy your chains overboard,
While the steam hums;
Men! to the battlement,
Farragut comes.

See, as the hurricane
Hurtles in wrath
Squadrons of clouds amain
Back from its path!
Back to the parapet,
To the guns' lips,
Thunderbolt Farragut
Hurls the black ships.

Now through the battle's roar
Clear the boy sings,
"By the mark fathoms four,"
While his lead swings.
Steady the wheelmen five
"Nor' by East keep her,"
"Steady," but two alive;
How the shells sweep her!

Lashed to the mast that sways
Over red decks,
Over the flame that plays
Round the torn wrecks,
Over the dying lips
Framed for a cheer,
Farragut leads his ships,
Guides the line clear.

On by heights cannon-browed,
While the spars quiver;
Onward still flames the cloud
Where the hulks shiver.
See, yon fort's star is set,
Storm and fire past.
Cheer him, lads—Farragut,
Lashed to the mast!

Oh! while Atlantic's breast
Bears a white sail,
While the Gulf's towering crest
Tops a green vale;
Men thy bold deeds shall tell,
Old Heart of Oak,
Daring Dave Farragut,
Thunderbolt stroke!

William T. Meredith.

POSTHUMOUS FAME; OR, A LEGEND OF THE BEAUTIFUL.

I.

HERE once lived in a great city, where the dead were all but innumerable, a young man by the name of Nicholas Vane, who possessed a singular genius for the making of tombstones. So beautiful they were, and so fitly designed to express either the shadowy pain of mortal memory or the bright forecasting of eternal hope, that all persons were held fortunate who could secure them for the calm resting-places of their beloved sleepers. Indeed, the curious tale was whispered round that the bereft were not his only patrons; that certain personages who were peculiarly ambitious of posthumous fame — seeing they had not long to live, and feeling unwilling to intrust others with the grave responsibility of having them commemorated — had gone to his shop and secretly advised with him respecting such monuments as might best preserve their memories from too swift oblivion.

However this may fall out, certain it is that his calling had its secrets; and once he was known rather pregnantly to observe that no man could ever understand the human heart until he had become a maker of tombstones. Whether or not the knowledge thus derived would make of one a laughing or a weeping philosopher, Nicholas himself remained a joyous type of youthful manhood — so joyous, in fact, that a friend of his who wrought in color, strolling one day into the workshop where Nicholas stood surrounded by the exquisite shapes of memorial marbles, had asked to paint the scene as a representation of Life chiseling to its beautiful purposes the rugged symbols of Death, and smiling as it wove the words of love and trust across the stony proofs of the universal tragedy. Afterwards, it is true, a great change was wrought in the young artisan.

He had just come in one morning and paused to look around at the various finished and unfinished mortuary designs.

"Truly," he said to himself all at once, "if I were a wise man, I'd begin the day's business by chiseling away at my own headstone. For who knows but that before sunset my brother the grave-digger may be told to build me

one of the houses that last till doomsday! And what man could then make the monument to stop the door of *my* house with? But why should I have a monument? If I lie beneath it, I shall not know I lie there. If I lie not there, then it will not stand over me. So whether I lie there, or lie not there, what will it matter to me then? Ay; but what if, being dead but to this world and living in another, I should yet look on the monument erected to my memory and therefore be the happier? I know not, nor to what end we are vexed with this desire to be remembered after death. The prospect of vanishing from this poor, toilsome life fills us with such consternation and pain! It is therefore that we strive to impress ourselves ineffaceably on the race, as though, after we had gone hence, or ceased to be, we should still have incorporeal habitation among all coming generations."

Here he was interrupted by a low knock at the door. Bidden to come in, there entered a man of delicate physiognomy, who threw a hurried glance around and inquired in an anxious tone:

"Sir, are you alone?"

"I am never alone," replied Nicholas in a ringing voice; "for I dwell hard by the gateway of life and death, through which a multitude is always passing."

"Not so loud, I beseech you!" said the visitor, stretching forth his thin, white hands with eager deprecation. "I would not, for the world, have any one discover that I have been here."

"Are you then a personage of such importance to the world?" said Nicholas, smiling, seeing that the stranger's appearance argued no worldly consideration whatsoever. The suit of black, which his frail figure seemed to shrink away from with very sensitiveness, was glossy and pathetic with more than one covert patch. His shoes were dust-covered and worn. His long hair went round his head in a swirl, and he bore himself with an air of damaged, apologetic self-appreciation.

"I am a poet," he murmured with a flush of pain, dropping his large mournful eyes beneath the scrutiny of one who might be an unsympathetic listener. "I am a poet, and I have come to speak with you privately of my — of the — of a monument. I am afraid I shall be forgotten. It is a terrible thought."

"Can you not trust your poems to keep you

remembered?" asked Nicholas, with more kindness.

"I could if they were as widely read as they should be." He appeared emboldened by his hearer's gentleness. "But, to confess the truth, I have not been accepted by my age. That, indeed, should give me no pain, since I have not written for it, but for the great future to which alone I look for my fame."

"Then why not look to it for your monument also?"

"Ah, sir!" he cried, "there are so many poets in the world, that I might be entirely overlooked by posterity, did there not descend to it some sign that I was held in honor by my own generation."

"Have you never noticed," he continued, with more earnestness, "that when strangers visit a cemetery they pay no attention to the thousands of little headstones that lie scattered close to the ground, but hunt out the highest monuments, to learn in whose honor they were erected? Have you never heard them exclaim: 'Yonder is a great monument! A great man must be buried there. Let us go and find out who he was and what he did, to be so celebrated.' Oh, sir, you and I know that this is a poor way of reasoning, since the greatest monuments are not always set over the greatest men. Still the custom has wrought its good effects, and splendid memorials do serve to make known in years to come those whom they commemorate, by inciting posterity to search for their actions or revive their thoughts. I warrant you the mere bust of Homer—"

"You are not mentioning yourself in the same breath with Homer, I hope," said Nicholas, with great good humor.

"My poems are as dear to me as Homer's were to him," replied the poet, his eyes filling.

"What if you *are* forgotten? Is it not enough for the poet to have lived for the sake of beauty?"

"No!" he cried passionately. "What you say is a miserable error. For the very proof of the poet's vocation is in creating the beautiful. But how know he has created it? By his own mind? Alas! the poet's mind tells him only what is beautiful to *him*. It is by fame that he knows it—fame, the gratitude of men for the beauty he has revealed to them! What is so sweet, then, as the knowledge that fame has come to him already, or surely awaits him after he is dead?"

"We labor under some confusion of ideas, I fear," said Nicholas, "and besides are losing time. What kind of mon—"

"That I leave to you," interrupted the poet. "Only I should like my monument to be beautiful. Ah, if you but knew how all through this poor life of mine I have loved the beauti-

ful! Never, never have I drawn near it in any visible form without almost holding my breath as though I were looking deep, deep into God's opened eyes. But it was of the epitaph I wished to speak."

Hereupon with a deeper flush he drew from a large inside breast-pocket, that seemed to have been made for the purpose, a worn duodecimo volume, and fell to turning the much-fingered pages.

"This," he murmured fondly, without looking up, "is the complete collection of my poems."

"Indeed!" exclaimed Nicholas, with deep compassion.

"Yes, my complete collection. I have written a great deal more, and should have liked to publish all that I have written. But it was necessary to select, and I have included here only what it was intolerable to see wasted. There is nothing I value more than a group of elegiac poems which every single member of my large family—who are fine critics—and all my friends pronounce very beautiful. I think it would be a good idea to inscribe a selection from one on my monument, since those who read the selection would wish to read the entire poem, and those who read the entire poem would wish to read the entire collection. I shall now favor you with these elegies."

"I should be happy to hear them; but my time," said Nicholas, courteously. "The living are too impatient to wait on me; the dead too patient to be defrauded."

"Surely you would not refuse to hear one of them," exclaimed the poet, his eyes flashing.

"Read *one*, by all means." Nicholas seated himself on a monumental lamb.

The poet passed one hand gently across his forehead, as though to brush away the stroke of rudeness; then fixing upon Nicholas a look of infinite remoteness, he read as follows:

"He suffered, but he murmured not;
To every storm he bared his breast;
He asked but for the common lot—
To be a man among the rest.

"Here lies he now—"

"If you ask but for the common lot," interrupted Nicholas, "you should rest content to be forgotten."

But before the poet could reply, a loud knock caused him to flap the leaves of the "Complete Collection" together with one hand, while with the other he gathered the tails of his long coat about him as though preparing to pass through some difficult aperture. The momentary exaltation of his mood, how-

ever, still showed itself in the look and tone of proud condescension with which he said to Nicholas:

"Permit me to retire at once by some private pass-way."

Nicholas led him to a door in the rear of the shop, and there with a smile and a tear stood for a moment watching the precipitate figure of the retreating bard, who suddenly paused when in the act of disappearing, and tore open the breast of his coat to assure himself that his beloved elegies were resting safe across his heart.

The second visitor was of another sort. He hobbled on a cork leg, but inexorably disciplined the fleshly one into the pathetic semblance of old-time firmness and precision. A faded military cloak draped his stalwart figure. Part of one bushy gray eyebrow had been chipped away by the same sword-cut that left its scar across his battle-beaten face.

"I have come to speak with you about my monument," he said in a gruff voice that seemed to issue from the mouth of a rusty cannon. "Those of my old comrades that did not fall at my side are dead. My wife died long ago, and my little children. I am old and forgotten. It is a time of peace. There's not a boy who will now listen to me while I tell of my campaigns. I live alone. Were I to die to-morrow my grave might not have so much as a headstone. It might be taken for that of a coward. Make me a monument for a true soldier."

"Your grateful country will do that," said Nicholas.

"Ha?" exclaimed the veteran, whom the shock of battle had made deaf long ago.

"Your country," shouted Nicholas close to his ear, "Your country — will erect a monument — to your memory."

"My country!" The words were shot out with a reverberating, melancholy boom. "My country will do no such thing. How many millions of soldiers have fallen on her battle-fields! Where are their monuments? They would make her one vast cemetery."

"But is it not enough for you *to have been* a true soldier? Why wish to be known and remembered for it?"

"I know I do not wish to be forgotten," he replied simply. "I know I take pleasure in the thought that long after I am forgotten there will be a tongue in my monument to cry out to every passing stranger, 'Here lies the body of a true soldier.' It is a great thing to be brave!"

"Is, then, this monument to be erected in honor of bravery, or of yourself?"

"There is no difference," said the veteran, bluntly. "Bravery *is* myself."

"It is bravery," he continued in husky tones, and with a mist gathering in his eyes that made him wink as though he were trying to see through the smoke of battle — "it is bravery that I see most clearly in the character of God. What would become of us if he were a coward? I serve him as my brave commander; and though I am stationed far from him and may be faint and sorely wounded, I know that he is somewhere on the battlefield, and that I shall see him at last, approaching me as he moves up and down among the ranks."

"But you say that your country does not notice you — that you have no friends; do you, then, feel no resentment?"

"None, none," he answered quickly, though his head dropped on his bosom.

"And you wish to be remembered by a world that is willing to forget you?"

He lifted his head proudly. "There are many true men in the world," he said, "and it has much to think of. I owe it all I can give, all I can bequeath; and I can bequeath it nothing but the memory of a true man."

One day, not long after this, there came into the workshop of Nicholas a venerable man of the gravest, sweetest, and most scholarly aspect, who spoke not a word until he had led Nicholas to the front window and pointed a trembling finger at a distant church spire.

"You see yon spire?" he said. "It almost pierces the clouds. In the church beneath I have preached to men and women for nearly fifty years. Many that I have christened at the font I have married at the altar; many of these I have sprinkled with dust. What have I not done for them in sorrow and want! How have I not toiled to set them in the way of purer pleasures and to anchor their tempest-tossed hopes! And yet how soon they will forget me! Already many say I am too old to preach. Too old! I preach better than I ever did in my life. Yet it may be my lot to wander down into the deep valley, an idle shepherd with an idle crook. I have just come from the writing of my next sermon, in which I exhort my people to strive that their names be not written on earthly monuments or human hearts, but in the Book of Life. It is my sublimest theme. If I am ever eloquent, if I am ever persuasive, if I ever for one moment draw aside to spiritual eyes the veil that discloses the calm, enrapturing vistas of eternity, it is when I measure my finite strength against this mighty task. But why? Because they are the sermons of my own aspiration. I preach them to my own soul. Face to face with that naked soul I pen those sermons — pen them when all are asleep save the sleepless Eye that is upon me. Even in the light of that Eye do I recoil from the thought of being forgotten."

How clearly I foresee it! Ashes to ashes, dust to dust! Where then will be my doctrines, my prayers, my sermons?"

"Is it not enough for you to have scattered your handful of good broadcast, to ripen as endlessly as the grass? What if they that gather know naught of him that sowed?"

"It is not enough. I should like the memory of *me* to live on and on in the world, inseparable from the good I may have done. What am I but the good that is in me? 'T is this that links me to the infinite and the perfect. Does not the Perfect One wish his goodness to be associated with his name? No! No! I do not wish to be forgotten!"

"It is mere vanity."

"Not vanity," said the aged servitor, meekly. "Wait until you are old, till the grave is at your helpless feet: it is the love of life."

But some years later there befell Nicholas an event that transcended all past experiences and left its impress on his whole subsequent life.

II.

THE hour had passed when any one was likely to enter his shop. A few rays of pale sunlight, straggling in through crevices of the door, rested like a dying halo on the heads of the monumental figures grouped around. Shadows, creeping upward from the ground, shrouded all else in thin, penetrable half-gloom, through which the stark gray emblems of mortality sent forth more solemn suggestions. A sudden sense of the earthly tragedy overwhelmed him. The chisel and the hammer dropped from his hands; and resting his head on the block he had been carving, he gave himself up to that mood of dim, distant reverie in which the soul seems to soar and float far above the shock and din of the world's disturbing nearness. On his all but oblivious ear, like the faint washings of some remote sea, beat the waves of the city's tide-driven life in streets outside. The room itself seemed hushed to the awful stillness of the high aerial spaces. Then all at once this stillness was broken by a voice, low, clear, and tremulous, saying close to his ear:

"Are you the maker of gravestones?"

"That is my sad calling," he cried bitterly, starting up with instinctive forebodings.

He saw before him a veiled figure. To support herself, she rested one hand on the block he had been carving, while she pressed the other against her heart, as though to stifle pain.

"Whose monument is this?"

"A neglected poet's who died not long ago. Soon perhaps I shall be making one for an old soldier, and one for a holy man, whose soul, I hear, is about to be dismissed."

"Are not some monuments sadder to make than others?"

"Ay, truly."

"What is the saddest you ever made?"

"The saddest monument I ever made was one for a poor mother who had lost her only son. One day a woman came in who had no sooner entered than she sat down and gave way to a passionate outburst of grief."

"My good woman," I said, "why do you weep so bitterly?"

"Do not call me good," she moaned, and hid her face.

"I then perceived her fallen character. When she recovered self-control she drew from her sinful bosom an old purse filled with coins of different values.

"Why do you give me this?" I asked.

"It is to pay for a monument for my son," she said, and the storm of her grief swept over her again.

"I learned that for years she had toiled and starved to hoard up a sum with which to build a monument to his memory; for he had never failed of his duty to her after all others had cast her out. Certainly he had his reward, not in the monument, but in the repentance which came to her after his death. I have never seen such sorrow for evil as the memory of his love wrought in her. For herself she desired only that the spot where she should be buried might be unknown. This longing to be forgotten has led me, among other things, to believe that none desire to be remembered for the evil that is in them, but only for some truth, or beauty, or goodness by which they have linked their individual lives to the general life of the race. Even the lying epitaphs in cemeteries prove how we would fain have the dead arrayed on the side of right in the thoughts of their survivors. This wretched mother and human outcast, believing herself to have lost everything that makes it well to be remembered, craved only the mercy of forgetfulness."

"And yet I think she died a Christian soul."

"You knew her, then?"

"I was with her in her last hours. She told me her story. She told me also of you, and that you would accept nothing for the monument you were at such care to make. It is perhaps for this reason that I have felt some desire to see you, and that I am here now to speak with you of—"

A shudder passed over her.

"After all, that was not a sad but a joyous monument to fashion," she added abruptly.

"Ay, it was joyous. But to me the joyous and the sad are much allied in the things of this life."

"And yet there might be one monument wholly sad, might there not?"

"There might be, but I know not whose it would be."

"If she you love should die, would not hers be so?"

"Until I love, and she I love is dead, I cannot know," said Nicholas, smiling.

"What builds the most monuments?" she asked, quickly, as though to retreat from her levity.

"Pride builds many—splendid ones. Gratitude builds some, forgiveness some, and pity some. But faith builds more than all these, though often poor, humble ones; and love!—love builds more than all things else together."

"And what, of all things that monuments are built in memory of, is most loved and soonest forgotten?" she asked, with intensity.

"Nay, I cannot tell that."

"Is it not a beautiful woman? This, you say, is the monument of a poet. After the poet grows old, men love him for the songs he sang; they love the old soldier for the battles he fought, and the preacher for his remembered prayers. But a woman! Who loves her for the beauty she once possessed, or rather regards her not with the more distaste? Is there in all history a figure so lonely and despised as that of the woman who, once the most beautiful in the world, crept back into her native land a withered hag? Or, if a woman die while she is yet beautiful, how long is she remembered? Her beauty is like heat and light—powerful only for those who feel and see it."

But Nicholas had scarcely heard her. His eyes had become riveted upon her hand, which rested on the marble, as white as though grown out of it under the labors of his chisel.

"My lady," he said, with the deepest respect, "will you permit me to look at your hand? I have carved many a one in marble, and studied many a one in life; but never have I seen anything so beautiful as yours."

He took it with an artist's impetuosity and bent over it, laying its palm against one of his own and striking it softly with the other. The blood leaped through his heart, and he suddenly touched it with his lips.

"God only can make the hand beautiful," he said.

Displaced by the arm he had upraised, the light fabric that had concealed her figure parted on her bosom and slipped to the ground. His eyes swept over the perfect shape that stood revealed. The veil still concealed her face. The strangely mingled emotions that had been deepening within him all this time now blent themselves in one irrepressible wish.

"Will you permit me to see your face?"

She drew quickly back. A subtle pain was in his voice as he cried:

"O my lady! I ask it as one who has pure eyes for the beautiful."

"My face belongs to my past. It has been my sorrow; it is nothing now."

"Only permit me to see it!"

"Is there no other face you would rather see?"

Who can fathom the motive of a woman's questions?

"None, none!"

She drew aside her veil, and her eyes rested quietly on his like a revelation. So young she was as hardly yet to be a woman, and her beauty had in it that seraphic purity and mysterious pathos which is never seen in a woman's face until the touch of another world has chastened her spirit into the resignation of a saint. The heart of Nicholas was wrung by the sight of it with a sudden sense of insoluble loss and longing.

"O my lady!" he cried, sinking on one knee and touching his lips to her hand with greater gentleness. "Do you indeed think the beauty of a woman so soon forgotten? As long as I live, yours will be as fresh in my memory as it was the moment after I first saw it in its perfection and felt its power."

"Do not recall to me the sorrow of such thoughts." She touched her heart. "My heart is a tired hour-glass. Already the sands are well-nigh run through. Any hour it may stop, and then—out like a light! Shapeless ashes! I have loved life well, but not so well that I have not been able to prepare to leave it."

She spoke with the utmost simplicity and calmness; yet her eyes were turned with unspeakable sadness towards the shadowy recesses of the room, where from their pedestals the monumental figures all looked down upon her as though they would have opened their marble lips and said, "Poor child! Poor child!"

"I have had my wish to see you and to see this place. Before long some one will come here to have you carve a monument to the most perishable of all things. Like the poor mother who had no wish to be remembered—"

Nicholas was moved to the deepest.

"I have but little skill," he said. "The great God did not bestow on me the genius of his favorite children of sculpture. But if so sad and sacred a charge should ever become mine, with his help I will rear such a monument to your memory that as long as it stands none who see it will ever be able to forget you. Year after year your memory shall grow as a legend of the beautiful."

When she was gone he sat self-forgotten until the darkness grew impenetrable. As he

groped his way out at last along the thick guide-posts of death, her voice seemed to float towards him from every headstone, her name to be written in every epitaph.

The next day a shadow brooded over the place. Day by day it deepened. He went out to seek intelligence of her. In the quarter of the city where she lived he discovered that her name had already become a nucleus around which were beginning to cluster many little legends of the beautiful. He had but to hear recitals of her deeds of kindness and mercy. For the chance of seeing her again, he began to haunt the neighborhood; then having seen her, he only returned to his shop the victim of more unavailing desire. All things combined to awake in him that passion of love whose roots are nourished in the soul's finest soil of pity and hopelessness. Once or twice, under some pretext, he made bold to accost her; and once, under the stress of his stricken passion, he mutely lifted his eyes, confessing his love; but hers were turned aside.

Meantime he began to dream in a sad way of the monument he chose to consider she had committed to his making. It should be the triumph of his art; but more, it would represent in stone the indissoluble union of his love with her memory. Through him alone would she enter upon her long after-life of saintlike reminiscence.

When the tidings of her death came he soon sprang up from the prostration of his grief with a burning desire to consummate his beloved work.

"Year after year your memory shall grow as a legend of the beautiful."

These words now became the inspiration of his masterpiece. Day and night it took shape in the rolling chaos of his sorrow. What sculptor in all the world ever espoused the execution of a work that lured more irresistibly from their hiding-places the shy and tender ministers of his genius? What one ever explored with greater boldness the utmost limits of artistic expression, or wrought in sterner defiance of the laws of our common forgetfulness?

III.

ONE afternoon, when people thronged the great cemetery of the city, a strolling group were held fascinated by the unique loveliness of a newly erected monument.

"Never," they exclaimed, "have we seen so exquisite a masterpiece. In whose honor is it erected?"

But when they drew nearer, they found carved on it simply a woman's name.

"Who was she?" they asked, puzzled and disappointed. "Is there no epitaph?"

"Ay," spoke up a young man lying on the grass and eagerly watching the spectators. "Ay, a very fitting epitaph."

"Where is it?"

"Carved on the heart of the monument!" he cried, in a tone of triumph.

"On the heart of the monument? Then we cannot see it."

"It is not meant to be seen."

"How do *you* know of it?"

"I made the monument."

"Then tell us what it is."

"It cannot be told. It is there only because it is unknown."

"Out on you! You play your pranks with the living and the dead."

"You will live to regret this day," said a thoughtful bystander. "You have tampered with the memory of the dead."

"Why, look you, good people," cried Nicholas, springing up and approaching his beautiful master-work. He rested one hand lovingly against it and glanced around him pale with repressed excitement, as though a long-looked-for moment had at length arrived. "I play no pranks with the living or the dead. Young as I am, I have fashioned many monuments, as this cemetery will testify. But I make no more. This is my last; and as it is the last, so it is the greatest. For I have fashioned it in such love and sorrow for her who lies beneath it as you can never know. If it is beautiful, it is yet an unworthy emblem of that brief and transporting beauty which was hers; and I have planted it here beside her grave, that as a delicate white flower it may exhale the perfume of her memory for centuries to come.

"Tell me," he went on, his lips trembling, his voice faltering with the burden of oppressive hope—"tell me, you who behold it now, do you not wed her memory deathlessly to it? To its fair shape, its native and unchanging purity?"

"Ay," they interrupted impatiently. "But the epitaph?"

"Ah!" he cried, with tenderer feeling, "beautiful as it is to the eye, it would be no fit emblem of her had it not something sacred hidden within. For she was not lovely to the sense alone, but had a perfect heart. So I have placed that within the monument which is its heart and typifies hers. And, mark you!" he cried, in a voice of such awful warning that those standing nearest him instinctively shrank back, "the one is as inviolable as the other. No more could you rend the heart from the human bosom than this epitaph from the monument. My deep and lasting curse on him who attempts it! For I have so fitted the parts of the work together, that to disunite would be

to break them in pieces; and the inscription is so fragile and delicately poised within, that so much as rudely to jar the monument would shiver it to atoms. It is put there to be inviolable. Seek to know it, you destroy it. This I but create after the plan of the Great Artist, who shows you only the fair outside of his masterpieces. What human eye ever looked into the mysterious heart of his beautiful—that heart which holds the secret of inexhaustible freshness and eternal power? Could this epitaph have been carved on the outside, you would have read it and forgotten it with natural satiety. But uncomprehended, what a spell I mark it exercises! You will—nay, you *must*—remember it forever! You will speak of it to others. They will come. And thus in ever-widening circle will be borne afar the memory of her whose name is on it, the emblem of whose heart is hidden within. And what more fitting memorial could a man rear to a woman, the pure shell of whose beauty all can see, the secret of whose beautiful being no one ever comprehends?"

He walked rapidly away, then some distance off turned and looked back. More spectators had come up. Some were earnestly talking, pointing now to the monument, now towards him. Others stood in rapt contemplation of his master-work.

Tears rose to his eyes. A look of ineffable joy overspread his face.

"O my love!" he murmured, "I have triumphed. Death has claimed your body, heaven your spirit; but the earth claims the saintly memory of each. This day about your name begins to grow the Legend of the Beautiful."

The sun had just set. The ethereal white shape of the monument stood outlined against a soft background of rose-colored sky. To his transfiguring imagination it seemed lifted far into the cloud-based heavens, and the evening star, resting above its apex, was a celestial lamp lowered to guide the eye to it through the darkness of the descending night.

IV.

MYSTERIOUS complexity of our mortal nature and estate that we should so desire to be remembered after death, though born to be forgotten! Our words and deeds, the ineffable influences of our silent personalities, do indeed pass from us into the long history of the race and abide imperishable there for the rest of time: so that an earthly immortality is the heritage, nay the inalienable necessity, of even the commonest lives; only it is an immortality not of self, but of its good and evil. For nature sows us and reaps us, that she may gather a harvest not of us but from us. It is God alone that gathers

the harvest of us. And well for us that our destiny should be that general forgetfulness we so strangely shrink from. For no sooner are we gone hence than even for such brief times as our memories may endure we are apt to grow by processes of accumulative transformation into what we never were. Thou kind, kind fate, therefore,—never enough named and celebrated,—that biddest the memory rise on our finished but imperfect lives and then lengthenest or shortenest the little day of posthumous reminiscence, according as thou seest there is need of early twilight or of deeper shadows!

Years passed. City and cemetery were each grown vaster. It was again an afternoon when the people strolled among the graves and monuments. An old man had courteously attached himself to a group that stood around a crumbling memorial. He had reached a great age; but his figure was erect, his face animated by strong emotions, and his eyes burned beneath his brows.

"Sirs," said he, interposing in the conversation, which turned wholly on the monument, "you say nothing of him in whose honor it was erected."

"We say nothing because we know nothing."

"Is he then wholly forgotten?"

"We are not aware that he is at all remembered."

"The inscription reads: 'He was a poet.' Know you none of his poems?"

"We have never so much as heard of his poems."

"My eyes are dim; is there nothing carved beneath his name?"

One of the bystanders went up and knelt down close to the base.

"There *was* something here, but it is effaced by time—Wait!" And tracing his finger slowly along, he read like a child:

"He — asked — but — for — the — the — common — lot.

"That is all," he cried, springing lightly up. "Oh, the dust on my knees!" he added with vexation.

"He may have sung very sweetly," pursued the old man.

"He may, indeed!" they answered carelessly.

"But, sirs," continued he, with a sad smile, "perhaps you are the very generation that he looked to for the fame which his own denied him; perhaps he died believing that *you* would fully appreciate his poems."

"If so, it was a comfortable faith to die in," they said, laughing, in return. "He will never know that we did not. A few great poets have posthumous fame: we know *them* well enough." And they passed on.

"This," said the old man, as they paused elsewhere, "seems to be the monument of a true soldier: know you aught of the victories he helped to win?"

"He may not have helped to win any victories. He may have been a coward. How should *we* know? Epitaphs often lie. The dust is peopled with soldiers." And again they moved on.

"Does any one read his sermons now, know you?" asked the old man as they paused before a third monument.

"Read his sermons!" they exclaimed, laughing more heartily. "Are sermons so much read in the country you come from? See how long he has been dead! What should the world be thinking of, to be reading his musty sermons?"

"At least does it give you no pleasure to read 'He was a good man'?" inquired he, plaintively.

"Ay; but if he was good, was not his goodness its own reward?"

"He may have also wished long to be remembered for it."

"Naturally; but we have not heard that his wish was gratified."

"Is it not sad that the memory of so much beauty and truth and goodness in our common human life should perish? But, sirs," — and here the old man spoke with sudden energy, — "if there should be one who combined perfect beauty and truth and goodness in one form and character, do you not think such a rare being would escape the common fate and be long and widely remembered?"

"Doubtless."

"Sirs," said he, quickly stepping in front of them with flashing eyes, "is there in all this vast cemetery not a single monument that has kept green the memory of the being in whose honor it was erected?"

"Ay, ay," they answered readily. "Have you not heard of it?"

"I am but come from distant countries. Many years ago I was here, and have journeyed hither with much desire to see the place once more. Would you kindly show me this monument?"

"Come!" they answered eagerly, starting off. "It is the best known of all the thousands in the cemetery. None who see it can ever forget it."

"Yes, yes!" murmured the old man. "That is why I have — I foresaw — Is it not a beautiful monument? Does it not lie — in what direction does it lie?"

A feverish eagerness seized him. He walked now beside, now before, his companions. Once he wheeled on them.

"Sirs, did you not say it perpetuates the memory of her — of the one — who lies beneath it?"

"Both are famous. The story of this woman and her monument will perhaps never be forgotten. It is impossible to forget it."

"Year after year —" muttered he, brushing his hand across his eyes.

They soon came to a spot where the aged branches of memorial evergreens interwove a sunless canopy and spread far around a drapery of gloom through which the wind passed with an unending sigh. Brushing aside the lowest boughs, they stepped in awe-stricken silence within the dank, chill cone of shade. Before them rose the shape of a gray monument, at sight of which the aged traveler, who had fallen behind, dropped his staff and held out his arms as though he would have embraced it. But controlling himself, he stepped forward and said in tones of thrilling sweetness:

"Sirs, you have not told me what story is connected with this monument that it should be so famous. I conceive it must be some very touching one of her whose name I read — some beautiful legend —"

"Judge you of that!" interrupted one of the group, with a voice of stern sadness and not without a certain look of mysterious horror. "They say this monument was reared to a woman by the man who once loved her. She was very beautiful, and so he made her a very beautiful monument. But she had a heart so hideous in its falsity that he carved in stone an enduring curse on her evil memory, and placed it in the heart of the monument because it was too awful for any eye to see. But others tell the story differently. They say the woman not only had a heart false beyond description, but was in person the ugliest of her sex. So that while the hidden curse is a lasting execration of her nature, the beautiful exterior is a masterpiece of mockery which her nature, and not her ugliness, maddened his sensitive genius to perpetrate. There can be no doubt that this is the true story, as hundreds tell it now, and that the woman will be remembered so long as the monument stands — ay, and longer — not only for her loathsome — Help the old man!"

He had fallen backward to the ground. They tried in vain to set him on his feet. Stunned, speechless, he could only raise himself on one elbow and turn his eyes towards the monument with a look of preternatural horror as though the lie had issued from its treacherous shape. At length he looked up to them, as they bent kindly over him, and spoke with much difficulty:

"Sirs, I am an old man — a very old man, and very feeble. Forgive this weakness. And I have come a long way, and must be faint. While you were speaking, my strength failed me. You were telling me a story — were you

not?—the story—the legend of a most beautiful woman, when all at once my senses grew confused and I failed to hear you rightly. Then my ears played me such a trick! Oh, sirs! if you but knew what a damnable trick my ears played me, you would pity me greatly, very, very greatly. This story touches me. It is much like one I seemed to have heard for many years, and that I have been repeating over and over to myself until I love it better than my life. If you would but go over it again—carefully—very carefully.”

“My God, sirs!” he exclaimed, springing up with the energy of youth when he had heard the recital a second time, “tell me *who* started this story! Tell me *how* and *where* it began!”

“We cannot. We have heard many tell it, and not all alike.”

“And do they—do you—believe—it is—true?” he asked, helplessly.

“We all *know* it is true; do not *you* believe it?”

“I can never forget it,” he said in tones quickly grown harsh and husky. “Let us go away from so pitiful a place.”

It was near nightfall when he returned, unobserved, and sat down beside the monument as one who had ended a pilgrimage.

“They all tell me the same story,” he murmured wearily. “Ah, it was the hidden epitaph that wrought the error! But for it, the sun of her memory would have had its brief, befitting day and tender setting. Presumptuous folly, to suppose they would understand my masterpiece, when they so often misconceive the hidden heart of His beautiful works and convert the uncomprehended good and true into a curse of evil!”

The night fell. He was awaiting it. Nearer and nearer rolled the dark, suffering heart of a storm; nearer the calm, white breasts of the dead. Over the billowy graves the many-footed winds suddenly fled away in a wild, tumultuous cohort. Overhead, great black bulks swung heavily at one another across the tremulous stars.

Of all earthly spots, where does the awful discord of the elements seem so futile and theatric as in a vast cemetery? Blow, then,

winds, till you uproot the trees! Pour, floods, pour, till the water trickles down into the face of the pale sleepers below! Rumble and flash, ye clouds, till the earth trembles and seems to be aflame! But not a lock of hair, so carefully put back over the brows, is tossed or disordered. The sleeper has not stretched forth an arm and drawn the shroud closer about his face, to keep out the wet. Not an ear has heard the riving thunderbolt, nor so much as an eyelid trembled on the still eyes for all the lightning’s fury.

But had there been another human presence on the midnight scene, some lightning flash would have revealed the old man, a grand, a terrible figure, in sympathy with its wild, sad violence. He stood beside his masterpiece, towering to his utmost height in a posture of all but superhuman majesty and strength. His long white hair and longer white beard streamed outward on the roaring winds. His arms, bared to the shoulder, swung aloft a ponderous hammer. His face, ashen-gray as the marble before him, was set with an expression of stern despair. Then, as the thunder crashed, his hammer fell. Bolt after bolt, blow after blow. Once more he might have been seen kneeling beside the ruin, his eyes strained close to its heart, awaiting another flash to tell him that the inviolable epitaph had shared in the destruction.

For days following many curious eyes came to peer into the opened heart of the shattered structure, but in vain.

Thus the masterpiece of Nicholas failed of its end, though it served another. For no one could have heard the story of it before it was destroyed without being made to realize, as never before, how melancholy the thought that a man should rear a monument of execration to the false heart of the woman he once had loved, and how terrible it would be for mankind to celebrate the dead for the evil that was in them instead of the good. So that even the story of it, as told here, may not only help to perpetuate the true memory of the rare being whom it was created to honor, but may have some influence in the direction of that tendency which, age after age, makes the whole of our common, human life grow more and more into an ever-lengthening Legend of the Beautiful.

James Lane Allen.

GLOUCESTER CATHEDRAL.

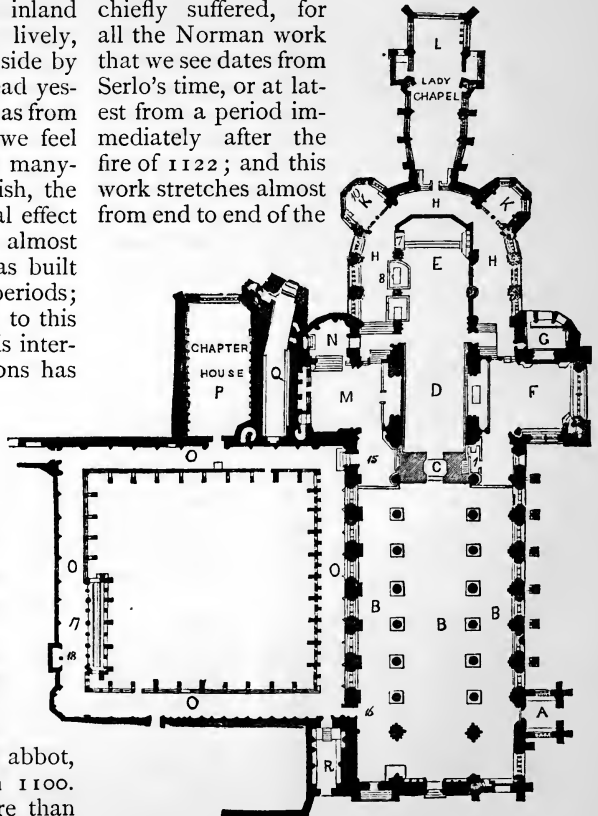

AT Gloucester, for the first time on our cathedral journey, we see masts and sails; and did we pursue our course through every ancient episcopal town in England we should nowhere feel closer to her "watery wall." Chichester stands very near the sea, and Norwich not far away from it; but both are out of sight of its waves, while great vessels come up the estuary of the Severn to Gloucester and lie in its capacious pools almost beneath the shadow of the cathedral tower. Here one may find sailors in the streets, smell tar, and fancy one smells salt; yet a pastoral country lies all around, backed by the Cotswold Hills—a tree-clad, meadowy, flowery country of genuine inland aspect. The town itself is quaint but lively, the antique and the modern living on side by side in a union as different from the dead yesterday-mood of many continental cities as from the crude to-day of America. Here we feel what England really means in a very many-sided way; and, just as we should wish, the cathedral is typically English in general effect yet distinctly individual and local in almost all its parts. Nearly the whole of it was built in the Norman and the Perpendicular periods; but just such Norman work is confined to this southwestern district, while the way it is interwoven with the Perpendicular additions has no parallel at all.

I.

THE first ecclesiastical foundation at Gloucester of which we can be sure was a nunnery established in the year 681. In 767 it perished in the confusion of internecine strife. In 823 a house for secular priests succeeded it. In 1022 Benedictine monks replaced the priests, and in 1058 the abbey was removed to another site and its new church was built where the cathedral stands to-day. In 1089 the foundations of still another church were laid by the first Norman abbot, Serlo, and a consecration followed in 1100. Such a ceremony often implied no more than that the choir was ready for occupation; but in this case we are asked to believe that the whole church had been finished. If so, a "Saxon" church, which had stood for thirty-one years and was probably as fine as any of its class,—for Gloucester and its abbey were

already great and famous,—must have been deliberately pulled down, and a building of the size we now behold must have been completed, all within the space of eleven years. The fact seems hardly credible, yet historians as careful as Freeman do not doubt it, and we know from what went on in many other spots how great was the ambition of the Normans to build much larger churches than they found in England, and how splendid was their energy when once they got to work.

Only two years after its consecration Serlo's church was injured by fire, in 1122 again and more severely, and very often in later years. But the roofs and clerestories and the interior fittings must have chiefly suffered, for all the Norman work that we see dates from Serlo's time, or at latest from a period immediately after the fire of 1122; and this work stretches almost from end to end of the

PLAN OF GLOUCESTER CATHEDRAL. (FROM MURRAY'S "HANDBOOK TO THE CATHEDRALS OF ENGLAND.")

A, South Porch; B, Nave; C, Choir-screen; D, Choir; E, Presbytery; F, South arm of Transept; G, Chapel; H, Choir-aisle; K, Ap-sidal Chapels; L, Lady-Chapel; M, North arm of Transept; N, St. Paul's Chapel; O, Cloisters; P, Chapter-house; Q, Abbot's cloister; R, Slype, or passage to cloisters; 1, Abbot Seabroke's Chantry; 7, Osric's Monument; 8, Monument of Edward II.; 10, Duke Robert's Monument; 15, Abbot's door to cloisters; 16, Monks' door to cloisters; 17, Lavatory; 18, Recess for towels.

GLOUCESTER CATHEDRAL FROM THE NORTH.

vast main fabric. The Lady-Chapel is a Perpendicular addition; the east wall has been remodeled; the western front and the two adjacent compartments of the nave have been rebuilt; in certain places new exterior walls and windows have been inserted; and the choir is covered with a decorative overlay of the most singular and interesting kind. But the great body of the structure below the clerestory is still Norman in all its constructional parts.

II.

GLOUCESTER, as well as Winchester, Lincoln, and York, was a fortified Roman station. Its Latin name was *Glevum* and its British name had been *Caer Glou*. Osric was the local viceroy under Ethelred of Mercia when the nunnery was founded in 681. Archbishop Theodore journeyed from Canterbury to its dedication, and its first abbess was of royal blood. After the time of Canute, when the Benedictines were introduced, both the abbey and the town grew and flourished greatly. During the reign of Edward the Confessor and of William the Conqueror, it was the custom for the king to "wear his crown" at each Easter festival at Winchester, at each Pentecost at Westminster, but at each Christmas-tide at Gloucester, and this ceremony implied the holding of a great "*gemôt*" for counsel and

judgment. The reason why Gloucester was thus honored is not hard to read — it lay near the confines of the two great earldoms of Wessex and Mercia, and also near the borders of the ever-troublesome Welsh. The Conqueror protected it with a great castle, and placed Serlo over St. Peter's Abbey when the English abbot, Wulfstan, died on a journey to the Holy Land. The house had then fallen so low that two monks and eight young novices were all who greeted their new ruler; and Serlo was busy collecting men and money long before he began to rebuild his church.

It was at one of the Gloucester "*gemôts*" that the taking of the famous survey called "*Domesday Book*" was ordered by William I. In 1093 William Rufus lay sick at Gloucester, and here Malcolm of Scotland was called to his bedside, and Anselm was reluctantly appointed archbishop of Canterbury and at once received his consecration in the abbey-church.¹ Here Duke Robert of Normandy, the eldest son of the Conqueror, was buried, and his tomb may still be seen. Here, in 1216, the boy-king Henry III., Henry of Winchester, was crowned while Westminster and his birthplace

¹ In the reign of William Rufus, says Freeman, "almost everything that happened at all somehow contrived to happen at Gloucester." ["Gloucester, its Abbey and Cathedral," in the "*Records of Gloucester Cathedral*," Vol. I.]

were both in the hands of foreign soldiers. Here Edward II. was buried in his turn, and the revenues of the monastery were enormously swelled by the fact. All through the Middle Ages, in short, St. Peter's Abbey flourished with a mighty growth while the town about it developed as commercial enterprise increased, and was constantly the stage where important

VI. A year after his appointment the parent see and the newer one were joined for a time and his title was Bishop of Gloucester and Worcester. But when Mary came to the throne he exchanged his palaces for a London prison. The rest of his story is well enough known. Here at Gloucester, almost within the precincts of his own cathedral, the great Prot-

THE SOUTH PORCH.

political scenes were played. Yet like the other abbey of St. Peter's, the "Golden Borough," Peterborough in its far eastern shire, this great establishment was not the seat of a bishop until the sixteenth century. Its church was one of the largest and finest in the land, and its income might have made many a prelate envious; but the cathedral title was not given until King Henry VIII. suppressed innumerable monasteries and made a few new bishoprics in their stead. Then the diocese of Gloucester was cut out of the great ancient diocese of Worcester.

After there were prelates in Gloucester only a single name, a single incident, attracts attention. The second bishop was John Hooper, once a monk, afterwards so stern a Protestant that he scrupled long to wear the episcopal robes when they were offered him by Edward

estant bishop was burned at the stake in 1555. With the exception of this name there is none, I think, on the list of Gloucester's prelates which would sound familiar in American ears, unless it be the name of William Warburton, who ruled from 1760 to 1779 and whose praises Dr. Johnson wrote.

III.

GLOUCESTER Cathedral stands a little aside from one of the main thoroughfares of the town. Its vast body is hidden by house-fronts, and we approach it through a short old street which shows us no great façade or tower or transept-end, only a part of the nave and a two-storied porch. This porch stands towards the western end of the south aisle and forms the main entrance to the church, and like the

THE NAVE, LOOKING EAST.

porch of Canterbury Cathedral is doubtless a survival of that great "Suth dure" which had been a characteristic feature of "Saxon" churches. The little street debouches on a narrow paved court with bits of lawn about it and the windows of cozy homes looking out upon the great pale-gray, carven church. To right and left the close extends, not very spacious in any direction, yet wide enough and shady and green enough to give the truly English cathedral atmosphere. Peace and beauty reign—we can hardly believe that the busiest street of a modern town lies but a few feet off. Glory to God and good-will to man seem chanted aloud by the voices of nature and of art. Memories of devotion, repose, and brotherly love, we fancy, must be the only ones that people such a spot. Yet not far away, just beyond the college-green, upon which looks the west-front of the church, Bishop Hooper was sent to Paradise through a door of flame.

The south porch is a rich little Perpendicular structure, almost wholly renewed in modern times, with a windowed vestibule below and a chamber above. The part of the church to which it belongs was rebuilt in the second half of the fifteenth century. Morwent, who was then the abbot, seems to have meant to build the whole of the nave afresh; and, as a beginning, he pulled down the western front, with its two flanking towers or turrets, and the two

adjacent bays of the nave. The whole of his front is filled, in the central alley and above a low stretch of wall in which is a small west-door, by a single window rising close up to the very ceiling. Its traceries show that final stage of Perpendicular designing when curved forms were almost altogether lost. It is divided by straight uprights and cross-bars into successive series of tall but very narrow lights, the tiny arched heads of which scarcely relieve the general effect of stiff rectangularity. Even in the upper part of the window-head, where further subdivision was necessary, smaller rectangles are used, and only two of the main mullions make an awkward attempt at curvature. It is not a beautiful window so far as design is concerned, but its size makes it impressive; and it must have been splendid indeed when filled with ancient glass instead of its present discords of impure and glaring tones.

The two compartments of the nave which Abbot Morwent built do not show that he had a very good ideal, or even a very clear ideal, of a great Perpendicular church in mind. The height is divided into three stages, although the time when such division was generally practiced had long gone by. Yet there is no triforium-gallery—nothing but a wide, plain strip of wall between the pier-arcade and the clerestory, defined but scarcely ornamented by a string-course above and below. Moreover,

GLOUCESTER FROM THE SEVERN.

the two bays are not alike. The westerly one is much wider than the other, and its pier-arch is a good deal taller; and thus the continuity of the string-courses is broken, and the clerestory windows are of different sizes. The aisles which flank these two bays are likewise Perpendicular reconstructions; but when we stand in this part of the church and turn our backs upon the window, we have a most imposing perspective of Norman work before us.

On each side are seven vast circular piers, thirty feet in height, bearing semicircular arches; above these is a very low triforium with four small arches in each bay, grouped in twos under wider semicircles; and above these again is a clerestory which was once considerably taller than it is to-day. The arrangement is entirely different from anything we have seen elsewhere. Norman builders, I have often said, usually made pier-arcade, triforium, and clerestory of almost equal height. At Norwich, for example, the piers measure but 15 feet and the whole height to the base of the triforium is 25 feet, while the triforium itself absorbs 24 feet and the clerestory 25. At Gloucester, with piers of 30 feet, the base of the triforium is 40 feet above the floor, while the triforium measures only 10 feet and

the clerestory originally measured 24. Circular piers, we know, are found in certain other parts of England and are most magnificently used at Durham. But Durham's design is almost as unlike Gloucester's as is the design of Norwich. There the circular-pier form alternates with the rectangular; the triforium, though not as high as at Norwich, Ely, and Peterborough, yet maintains its typical Norman importance; and the design gains unity and constructional logic through the presence of massive vaulting-shafts, rising against the alternate square piers from the pavement to the roof. But what we see at Gloucester is simply a great colonnade, so all-important in the general effect that the upper stories almost look like afterthoughts. Only in this south-western part of England do designs like this occur. Tewkesbury Abbey church, which stands not many miles away, is very like the nave of Gloucester Cathedral.

Of course the expression of the nave was far finer when the Norman clerestory was intact. It probably had a group of three windows in each compartment, under an including-arch of which the jambs have been suffered to remain; and the ceiling was doubtless flat and constructed of wood like those

which still exist at Peterborough and Ely. We may not greatly admire the effect of such a ceiling, yet it was better suited to a Norman nave than the very low-pitched vaulting at Gloucester, to accommodate which the clerestory has been cut away. Then, too, the floor once lay a foot below its present level, and this addition to the bases of the piers must have been of great advantage. Nevertheless we feel that the nave of Gloucester was always a stupendous rather than a beautiful piece of work. There is wonderful beauty at Durham, and again, of a different sort, in the great Norman interiors of the eastern shires. But here the

it is plain that at Gloucester, where the height of the piers is doubled, the arches seem too small. A wider spacing of the piers would have permitted arches of a span sufficient to harmonize with their size; but the height of the arches would, of course, have been proportionately increased; and, given the inconsiderable altitude of an English interior, what would then have become of the triforium, which even now is so very low? But the arcade itself would have been infinitely finer. As it stands it has a high-shouldered, awkward look. The piers are too tall, say certain English critics. A Frenchman would be more apt to say: The piers are superb; the fault lies in the English love of low ceilings; there should have been

NORTHWEST VIEW OF THE CATHEDRAL, FROM TOWER OF ST. MARY DE LODE.

proportioning is such that the word beauty hardly seems appropriate. The piers themselves are magnificent if we look at them alone; but the real excellence of any architectural feature lies in its harmony with connected features, and these piers are so closely set that their arches seem far less noble than themselves. It will be seen from the figures I have given that at Gloucester, as at Norwich, the capitals of the piers come within ten feet of the base of the triforium. This means that the arches in the one case are no taller than in the other, and that they are no wider, as the width of a semi-circular arch is strictly dependent upon its height. There is no fault to find with the proportions of the Norwich arcade, and therefore

finer arches, and then taller upper stories to justify the huge arcade.

All the paint which once covered these massive stones has perished, and here and there we can see ruddy spots and streakings which bear witness to the fires of long ago. The capitals of the piers are very plainly molded, but the string-courses and the arch-moldings in all the stories are worked with characteristic Norman patterns. The vaulting-shafts which now descend above each pier give the most conspicuous touch of decoration, but these are later additions to the original scheme. They are Early-English features, built, with the ceiling itself, in the first half of the thirteenth century. Each is formed as two super-

imposed clusters of little marble columns with dainty capitals, and the design is as sensible as charming: a single cluster of columns resting on the triforium string-course would have had too stumpy a look, yet a single series of longer columns would have ignored the presence of the string-course. It is interesting, too, to note that, in some places at least, there is proof of a rather exceptional desire to harmonize the new details with the old. The string-courses are adorned with that Norman zigzag or "chev-

ron" pattern which had long gone out of use when these additions were made; yet on the bases of many of the upper groups of little columns the same pattern is carefully carried along.

Gloucester Cathedral was not exempt from the disasters which came to so many great Norman works through the want of care or want of knowledge of their builders. One of the towers or turrets which flanked the western front fell about seventy years after it had been built, and was reconstructed, together with its mate, in the Early-English period, only to be swept away again when Abbot Morwent built

his Perpendicular façade. In the Decorated period, near the beginning of the fourteenth century, the outer wall of the south aisle of the nave was partly renewed by Abbot Thokey; and although I cannot find the fact expressly stated, a threatened collapse must have been his motive. The inner facing of the walls, and the half-piers which support the aisle-vaults, are Norman still; but the outer facing and the vaults themselves are Abbot Thokey's work, and likewise the windows with their Decorated traceries. Now, as seen from the inside, the enormous half-piers and the walls are eleven inches out of the perpendicular—a deflection the effect of which is scarcely exaggerated in the picture on this page.

On the outside,

however, the inclination is but four inches. Of course Abbot Thokey built his part of the wall erect; and thus four inches of movement may be laid to the five centuries and a half which have elapsed since his time, and seven inches to the two centuries which had stretched between Serlo's labors and his own. Seven inches of movement may well have torn the aisle-vaults asunder and seemed reason enough for strengthening the outer walls. Had

SOUTH AISLE OF THE NAVE, LOOKING EAST INTO THE TRANSEPT.

IV.

THE north aisle of the nave is still in its original condition except as regards the Perpendicular traceries which have been inserted in

THE NAVE FROM THE NORTH AISLE.

Thokey been inspired by a mere wish to rebuild without actual necessity he would hardly have left so much of the original work as he did. Nor can we lay the damage he found to the account of fire, even had it not continued after his death — it must have been caused by bad foundations.¹

The plain ribbed Norman vaulting still remains in the north aisle, and by comparison we see that Thokey chose a considerably lower level for his. The adornment of his exterior

walls and his windows (one of which is seen in the distance in the picture on this page) is very charming, and the “ball-flower” ornament which was characteristic of the Decorated period was seldom so lavishly or beautifully applied. It is a pity that all these lights should now be filled with modern glass, some of it tolerable but much of it atrocious. In the north aisle are many sepulchral monuments, but none of great age or interest. But at the eastern end of the south aisle, with its head against one of

¹ In a report of a lecture on Gloucester Cathedral which had been delivered by Professor Willis, the “Gentleman’s Magazine” for September, 1860, says: “He admired the ingenuity of the Middle Ages; but whatever may be said of their science as shown in their masonry, he believed they had none. They were perfectly practical and ingenious men; they worked ex-

perimentally; if their buildings were strong enough, they stood; if they were too strong, they also stood; but if they were too weak, they gave way, and they put props and built the next stronger. That was their science, and very good practical science it was; but in many cases they imperilled their work and gave trouble to future restorers.”

the piers of the great central tower he built, is the shattered chantry-tomb of Abbot Seabroke, who died in 1457.

The "ritual choir" projects, in the old Norman fashion, across the intersection of nave and transept, and its screen fills up one bay of the nave itself. This screen is an ugly piece of modern work bearing an uglier organ in the place once given to the Holy Rood.

V.

A GLANCE at the ground-plan of Gloucester shows how little alteration it has undergone

to the choir-aisles beyond; they are shut off from the "ritual choir" by a high solid wall; and thus isolated, with the apse-like little chapels in their eastern faces and their many tombs and sepulchral slabs, they look more like a pair of larger chapels than a transept of the usual Norman kind. Moreover, not only all five of the little chapels but the end of the church itself was polygonal in shape, and this was uncommon in Norman buildings. Semi-circular end-walls were the rule; only with the advent of the Pointed styles did the polygonal termination develop in France while the simpler rectangle became the English type.

NORTH WALK OF CLOISTERS WITH THE LAVATORY.

since Norman days. The transept still has a polygonal chapel opening from the eastern face of each of its arms, and the sweep of the aisle of the choir is still intact with two of the three small chapels which opened out of it.

But, as I have said, many things at Gloucester are peculiar, and among them is the ground-plan of the eastern limb. Two steps lead up to the aisles on either side of the choir-screen which fills the last bay of the nave; and the rectangular spaces thus set apart seem like vestibules to the transept-arms. These are exceptionally short, only one bay on each side of the crossing; steps again lead up from them

East of the crossing, however, the constructional design is much more normal than in the nave. The piers still display the circular form, but are so much lower that the proportioning is about the same as in the great churches of eastern England, the pier-arcade and the triforium being of equal height; and the triforium openings are huge single arches such as we have seen at Ely.

Of course a discrepancy of this kind between nave and choir would not be remarkable did they belong to different periods. But here a single period includes them, even if we believe that either the western or the eastern limb may

have been reconstructed after the fire of 1122. Even so, everything falls well within the purely Norman period. This being the case, we might expect to see in the later work a desire to carry on the original scheme at least in its chief features—something more like what we saw at Durham, where Ralph Flambard's nave is but a richer version of William of Carilef's work in the choir. I think it would be difficult to find in any other Norman building a parallel to that striking variation in the essentials of the design which exists at Gloucester.

VI.

But if I say that the eastern limb of Gloucester was built, broadly speaking, like the eastern limb of Peterborough, and that below the clerestory it still exists, do not imagine that its effect is still the same. It no longer appears as a solemn perspective of round arches, thick plain piers, and naked fields of wall. Yet its original substance is not concealed from view and its Norman origin denied in the same way as at Winchester. The whole effect (I hardly know what words to use, it is so singular)—the whole effect is Perpendicular; yet when we look a moment we see that the whole body of the work is Norman still. The Perpendicular features are not constructional but decorative; yet they are so applied as to simulate a structural design. The entire surface of the vast Norman interior is covered with a rich overlay of moldings and traceries through the interstices of which the original design may still be followed, the original stones may still be seen.

The clerestory is wholly Perpendicular, built in the middle years of the fourteenth century. The great windows, each filling its compartment from side to side, were divided in the usual Perpendicular manner into elongated rectangular lights with tiny arched and trefoiled heads; and the same design was continued downwards to the very floor, not only over the wall-spaces but over the openings too. The wide triforium openings, and even those of the pier-arcade between the central alley and the aisles, were treated like unglazed windows and screened with this network paneling, while the piers were faced with slender grouped shafts and small capitals which support the elaborate ceiling.

Of course this ceiling, like the clerestory, is of Perpendicular origin; and, as I have told, the east-end of the presbytery was more radically remodeled than its sides. The wall between the central space and the encircling aisle was torn down; length was increased by adding a narrow compartment on each side, and breadth

ST. PAUL'S CHAPEL, NORTH ARM OF TRANSEPT.

by slanting the addition outwards; and then a wall was built across the end, but no higher than the base of the triforium stage. This wall, pierced with one semicircular and two pointed arches, is again not straight, but forms one longer and two shorter sides of a polygon. Across it stands the tall reredos; over its surface and its three large openings runs the ubiquitous paneling; and this continues upwards, without a conspicuous break in the design, to form the vast window which fills all the rest of the space. One could hardly imagine a more magnificent effect than is thus created. A critic who believes that architectural factors should not only be strong enough but look strong enough, who insists that some visible sturdiness should appear in a wall which is crowned by a visibly ponderous roof, may find much excuse for disapproval. But if we merely seek a wondering pleasure for the eye, then indeed we stand in the right place. Close up under the vaulting and close to the piers on each hand comes the stupendous wall of glass,—a single window to the eye although bent to a three-sided shape,—held together by stone-work patterns so open and slight that we feel as though a strong wind could make an end of it. Seventy-two feet in height and thirty-eight in breadth, it is the largest single opening in the world, and we fancy it the most fragile. Yet it has stood, stone and glass together, through five centuries of sun and storm, and through more than one of total neglect. It was thoroughly repaired in

CHOIR AND PRESBYTERY, LOOKING EAST.

1862 and all its panes were re-leaded. But we can hardly call a work unstable which demands such helping after half a thousand years.

It is difficult even to suggest the sumptuous effect of this transfigured choir, or the ingenious ways in which the traceries have been adapted to their very various situations. Mr. Pennell's pictures will serve much better than words, but nothing in architecture so vast and elaborate as this can ever have its veritable look explained on paper.

The view of choir and presbytery from the entrance of the "ritual choir" in the nave, which is given on this page, reveals the east window far off in the distance and the richness of the ceiling; gives a glimpse at the left into the north arm of the transept; and shows the flying arch which springs across the whole width of this arm beneath the great arch that supports the tower. On page 691 we stand in the north aisle of the nave, look into the transept, and beyond it dimly discern the choir-aisle; to the left is the abbot's door into the cloisters and one of the Norman windows—which were placed so high to clear the cloister roofs—filled with Perpendicular traceries; and on the right is a portion of the wall which shuts in the "ritual choir." On page 693 we are placed in the south transept and can appreciate its chapel-like effect; and looking westward along the aisle of the nave, under the lofty constructional arch below which extends the open tracery, we see one of Abbot Morwent's Perpen-

dicular windows in the west façade. And on page 686 the view is reversed: we are in the south aisle of the nave with its leaning half-piers and Decorated vaulting, and see the screen-work in the south arm of the transept.

Interesting indeed are the perspectives, varied with every step we make, which show the Perpendicular adornment set now in lines of black against some brightly lighted space, and now in lines of light against a dark stretch of aisle or deep triforium opening. Nothing could be more radical than its contrast with the massive simple forms amid and over which its graceful arches and slender rectangles are woven. Yet the general effect is never inharmonious; or if it is, we forget the fact in our delight in the imaginative

power and technical skill which could thus change sternness into lightness, solemnity into grace, a ponderous into a delicate vigor, a majestic uniformity into an almost playful elaboration. Other interiors are more logical, more truly beautiful than this; but there is none more stately, more rich, or more imposing; and there is none which so clearly reveals that almost passionate love for the style and manner of their own time which ruled the people of the fourteenth century. Simply a desire for what was thought a far superior kind of beauty led to the alteration of this Norman work. Yet how naïve was the desire, how different from the attitude of modern men towards the things of art! Sometimes we piously "restore" an ancient work and bring it back to its original estate as nearly as our poor wits know how. Sometimes we pull it down entirely and build a new work of our own. And we can imagine, perhaps, doing what Wykeham did at Winchester—using our forefathers' fabric as though it were our own, but carefully concealing the fact that we had borrowed it. But so imperious a wish to alter for the mere sake of altering, combined with so entire a frankness in confessing alike the change and our reason for making it, this we cannot fancy by any possible effort.

VII.

A TRUSTWORTHY local chronicle recites that the choir of Gloucester was cased and vaulted

by Abbots Staunton and Horton, who ruled the house of St. Peter between 1337 and 1377. The work was begun in the south transept, and all the other portions, including the lower stage of the tower, were finished before the east wall was turned into a gigantic window. The spring-

part of the tower harmonious with the rest of the design, it was necessary to divide the paneling on each face of the lantern-wall into two main arches; hence the need for ribs descending to a capital which had no pier to bear it; and hence the device of the flying arch to sup-

FROM THE NORTH AISLE OF THE NAVE, LOOKING EAST INTO THE TRANSEPT.

ing of the flying arch that is pictured on page 690 marks the level above which the whole fabric was new — the level of the top of the triforium. High above this flying arch soars the one which supports the side of the tower; this one merely supports a capital, corresponding to the capitals of the pier-shafts. To keep the vaulting of the lantern formed by the open

port this capital. It was a bold expedient from the artistic point of view, yet not too bold to be in keeping with the rest of the work; and from the structural point of view there was little audacity. The light, flying spans (there is another opposite the one our picture shows) seem to support the tower vault; but in reality this is carried by more solid stones above.¹

¹ I can find no record with regard to the condition of the tower and the upper parts of the transept and eastern limb when Abbot Staunton began his work;

but from the witness of the nave and the history of the cloisters we must believe that they had already been once rebuilt in the Early-English style.

Only as high as the top of the lantern did Abbots Staunton and Horton carry the tower. The magnificent upper body which appears outside the church was begun by Abbot Seabroke, whose chantry rests against one of the supporting piers, and was finished soon after his death, about the middle of the fifteenth century. Morwent had ruled in Gloucester just before Seabroke's time. The splendor of the new-wrought choir seems to have inspired him with a wish to rebuild the nave. The parts that he completed make us glad that he went no further; and Seabroke was wise to finish the tower instead of carrying out Morwent's scheme.

Early-English stalls once furnished the choir, and a rare fragment or two remain to show their character. But the work of redecoration was thoroughly done in the fourteenth century, and the present stalls, with tall overhanging canopies, are delightful examples of Perpendicular art. They are much restored, however, and the great reredos under the east window is modern. Behind this is a narrow space which was doubtless the feretory, or chamber for lesser relics, a receptacle likewise used in times of trouble to conceal the treasures of the church.

Three monuments deserve attention — a memorial to Osric, the old English viceroy, set up centuries after his death; the tomb of Robert of Normandy, with a curious wooden figure; and the sepulcher of Edward II., which stands between two of the plain, low Norman piers of the choir. In 1327 the body of the king, who had been murdered in Berkeley Castle, was brought by Abbot Thokey to Gloucester, and a fitting tomb was built for it by Edward III. At once it became the object-point of pilgrimages; and the wealth that flowed for its sake into the coffers of the abbey was for its sake expended on the transfiguration of the building which it honored. Yet no king could have asked for a finer monument than the tomb itself — a lofty base bearing the usual recumbent figure, and a soaring canopy, all covered with slender pinnacles and arched niches, wrought in the rich and graceful late-Decorated style. Here Edward III. hung up a great golden vessel after he was saved from shipwreck; hither the Black Prince brought a golden crucifix with a bit of the True Cross; among countless minor offerings hung a ruby necklace sent by the Queen of Scotland, and a jeweled heart of Queen Philippa's; and here miracles were wrought for all who wanted them.

The Perpendicular screening conceals this monument from the choir, but we see it fully in the encircling aisle, to which the apsidal chapels give unwonted interest. Once there

were three such chapels and all three stood for nearly a century after the new window was built. But about 1450 the central one was removed and the place it had filled became a low-walled vestibule for a splendid Lady-Chapel.

The picture on page 695 will explain the station of this chapel better than any words. It is another of the individual features of Gloucester. It is an independent building, not a continuation of the church; within the choir no sign of it appears except its shadow on the great glass wall. Only when we get behind this wall in the aisle do we realize that there is still a farther space. An astonishing space it is — the fabric seeming almost all of glass and complicated with open screens wherever screens could go. It has not a very ecclesiastical look, perhaps. It is long and narrow, without aisles; and on the right hand and the left are little side chapels, two-storied each, which in their elaborate enframing — be it said beneath my breath — are not dissimilar to gorgeous Gothic opera-boxes. But the many sepulchral slabs in the pavement excite a soberer feeling; and whatever the spiritual mood it fosters, there can be no question with regard to the beauty of the room.

The ingenuity with which it was united to the church on the old Norman foundations best appears in the triforium which encircles the whole east-limb. As wide as the aisles below, extending above the apsidal chapels and lighted by large windows, this triforium can hardly be called a gallery; it is more truly an upper story for oratories and altars. Its space, however, was so greatly encroached upon at the extreme end, when a bay was added to the presbytery and the huge window was built, that here it is indeed a passage merely — seventy-five feet in length but only three in breadth and eight in height, running like a sort of bridge over the vestibule below, between the east window of the church and the west window of the Lady-Chapel, close to both but touching neither. Although the terminal Norman chapel was destroyed below, it was preserved in this second story, and we now enter it like a bay-window from the narrow gallery and look into the Lady-Chapel. Here, too, we see that three great flying-buttresses spring from the outer wall of the aisle, meet in a point behind the new inner wall, and sustain the slender buttress which professes to support the gigantic window. The whole arrangement is extremely curious, extremely skillful — easy enough to appreciate on the spot but difficult to describe. To the average tourist, however, the chief interest of this bridge-like gallery lies in its accidental acoustic properties. It is famous as the "whispering gallery of Gloucester," for the lowest utterance voiced at one end, or the slightest

SOUTH AISLE OF THE NAVE, LOOKING WEST FROM THE TRANSEPT.

pin-scratch made on the wall, is heard distinctly at the other end, seventy-five feet away.

The crypt perfectly reproduces the plan of the old Norman east-limb, and it likewise extends beneath the apsidal chapels of the transept, although not beneath the transept itself. The eastern end seems to have been built on a quicksand with insufficient foundations. The remaining features in this part of the upper church show signs of dislocation, and there are visible works of reinforcement in the crypt. But these are Norman, like the original

stones; and in the rest of the choir and presbytery the early builders built their best. Here their fabric stands straight and sturdy still, although the east wall has been turned into glass, a heavy Perpendicular decoration has been cemented on all the surfaces, and a tremendous tower rests on the four old supports.

VIII.

INTERMINGLED Norman and Perpendicular work still meets us as we pass to the chapter-

house and cloisters. The entrance to the chapter-house is through a great semicircular doorway, and within we see a rectangular room, seventy-two feet long and thirty-four feet wide, flanked for three-quarters of its length by a plainly wrought round-arched arcade. The eastern end, however, looking with its cut-off corners like an apse, is a Perpendicular addition. Here is a large east window, and the roof is richly groined. Elsewhere it is a slightly pointed barrel-vault of wood borne by

preserved. The open arcade, characteristic of earlier times, here gave way to rows of great glazed windows that insured complete protection from the weather. In the north walk the wall projects a little to give room for the lavatory, a hollowed stone bench of considerable length, while opposite is a closet for towels; and the south walk is lined to nearly half its height by a row of little cells, one lying beneath each window. Set thus far away from the distractions of the world, these "carols"¹ served as studies for the monks; and so peaceful, so ancient, yet so serviceable seems the spot that we half expect, as each little closet is passed, to see a sable gown and a shaven poll bending over some ponderous work of ghostly counsel,

three transverse arches. Above the chapter-house is a library of Perpendicular design, likewise with a great east window; and between it and the church lies a narrow walk, called the "Abbot's cloister," which, again, is partly Norman, partly Perpendicular.

GLOUCESTER CATHEDRAL FROM THE DOCKS.

The chapter-house itself opens on the main quadrangle. Abbot Horton, who completed the casing of the choir, began his rule in 1351, and Abbot Frocester, who wrote the chronicle which tells us all we know of the mighty fabric of St. Peter's, died in 1412. Between these dates the cloisters were built, taking the place of an Early-English quadrangle which itself must have supplanted a Norman one. At Gloucester, as we know, cloisters were really needed, not for mere architectural display, but for the daily exercise and labor of a large houseful of monastic brethren. And the fact is clearly apparent to the eye. These, I think, are the most magnificent cloisters in England, and in no others are signs of utility so well

or tenderly bringing into life the brilliant initial letters of a Book of Hours.

But the great feature of these cloisters, for historic interest as for beauty, is the roof, which spreads its enormous fans of stone above all four walks. It would be impossible here to detail the reasons, half constructional, half esthetic, which led to the adoption of this form of vaulting. It must suffice to say that it was peculiar to England. In many other localities we find it on a much more magnificent scale—as in the "New Building" eastward of the choir at Peterborough. But very often he who did a thing first interests us more than he who did it best. Although there were causes and reasons why the fan-vault came to be adopted, no gentle successive experimental steps led up to its completed form. Whatever may have been the fact with other medieval

¹ This word comes from the medieval Latin "carola," a lattice, railing, inclosure; literally, a circle.—*The Century Dictionary*.

features, in this case some one man in some one place must first have used these great inverted cones, covered them with the favorite paneled patterns, and filled the intervening spaces with ornamental circles. And this man's work, it is generally thought, we see in the Gloucester cloisters. Judged for true architectural beauty fan-vaulting may not satisfy the purest taste; perhaps it even looks, as has sometimes been said, as though composed of vaults turned inside out. But it has many defenders in the land where

the central tower of Canterbury. There is the same division into two stories with four canopied windows in each face, and almost the same height—235 feet at Canterbury, 225 at Gloucester. But the fact that the Gloucester tower was the earlier by almost half a century—it was begun in 1450 and the Canterbury tower not till 1495—shows clearly in the treatment of the angles. Although the details of Perpendicular work include an infinitude of horizontal lines, vertical continuity in the main constructional features was steadily developed as the style progressed. In Gloucester's tower the string-courses are strongly marked and the angle-turrets stop with the lower stage. But in Canterbury's the turrets run

it was born, and there is no other form of ceiling that is at once so individual and so sumptuous, and therefore so likely to delight an uncritical eye. No matter what there is below it, a splendid majesty springs from its presence; and it has the air of being incomparably daring, although in fact it is less difficult to build than are vaulted ceilings of many other types.

The great tower shows admirably from the cloister-garth, but I shall not attempt to say from what point it shows best. For many miles away on every side we see its rich, pale-gray form, relieved against the pale-blue of an English sunny sky, or blending tone for tone with the soft colors of English clouds, or standing out, dark for the nonce, against the splendors of a sunset—a “pharos to the neighboring hills,” as Leland called it in his “Itinerary” centuries ago. In general scheme it is very like

up straight and slender to the cornice and beyond it, forming without a break the pinnacles above the roof.

There are many other points of interest in the exterior of the church, but my space runs short. I can only say that while the general composition as we approach the south porch is by no means so grandiose as that which a similar position reveals at Canterbury or at Lincoln, it would be hard to find anything more typi-

SOUTHEAST VIEW OF THE CATHEDRAL, FROM TOWER OF ST. JOHN'S CHURCH.

THE LADY-CHAPEL, LOOKING TOWARDS THE CHURCH.

cally cathedral-like in magnificence and power than the view from the eastward, showing the Lady-Chapel grouped with the traceried east-end, and the gorgeous tower soaring behind.

IX.

THE beginning of the Perpendicular style may be placed, as we have seen, near the middle of the fourteenth century, and its end was not until the death of Gothic art in general—until the triumph of the re-born classic spirit. During two centuries and more of great national activity, wealth, and ambition, when

architecture was the most vital and progressive of all the arts, we might expect to find that a multitude of changes came about; and, in truth, the earlier Perpendicular work differs in very important ways from that of the later period.

At first the new idea—which can broadly be described as a reaction from the sweetness, grace, and variety of the Decorated style towards a greater formality and severity—expressed itself in the design of the window-traceries and in the continuation of their panels over the walls. Then the arch was altered from a “two-centered” to a “four-centered”

shape.¹ The four-centered shape proved extremely useful because it could easily be adapted to openings of any relative dimensions; and nothing could be better than its effect in doorways, like the one in Winchester's west-front, or in purely decorative work, like the overlays at Gloucester. But in important constructional features—in pier-arcades, for instance, and large wall-like windows—it has a look of weakness and of insufficient strength and dignity. Meanwhile the groined vault was becoming more and more complicated in its starry or twig-like or spider-web intersections; and at last it was replaced by the fan-vault, the final and most striking development of which we shall see in the Chapel of Henry VII. at Westminster.

In the earlier periods of the style a vast amount of work was done in the cathedrals. But by the time the style had reached its very latest development there was little left to alter or rebuild in them; and to make a complete study of Perpendicular art we must turn to parish churches, and especially to the great collegiate buildings at Cambridge and Oxford. Yet a very adequate idea of its course may be gained at Gloucester. Here in the south arm of the transept we are bidden by many to see the first piece of work in England which can truly be called Perpendicular; the rest of the transept and the east-limb reveal the successive steps which brought the style to its middle development; the tower and the Lady-Chapel are later still; and in the cloisters, as has been told, we probably find the first fan-vaults that were ever built.

A word more about the window-traceries. I tried to show in a former chapter how such traceries developed from two or three plain windows simply grouped together with pierced openings in the wall above; and how their character radically changed, at first the form of the openings—light in a dark space of wall—being the thing which the architect bore in

mind, and afterwards the pattern made by the stone bars, dark against a background of light.² In the height of the Decorated style, when English architecture was most nearly akin to French, this type of window-design reached its most perfect estate; and in France it was never given up. It was pushed more and more to an extreme, the stone bars flowing and curving in the richest patterns, and the shape of the lights being ever less and less regarded.

But in England the change from the Decorated to the Perpendicular style meant a going back, in theory, to first principles. In a typical Perpendicular window the eye is again supposed to rest, not upon the tracery-patterns, but upon the shape of the lights themselves. These are fine in outline and harmoniously grouped, while if we follow the stone lines we find them always uninteresting and often ugly. English writers sometimes protest that the change was a good one, or that it was at least logical and satisfactory in view of the development of the glazier's art.³ In theory we may perhaps agree with them; and, abstractly considered, the forms of the stone-work in Perpendicular traceries are perhaps not more ungraceful than those of the plate-traceries of early times. But face to face with his work we are not content with the Perpendicular architect's conception. The mind may grasp and even approve his idea; the eye cannot accept it. No one notices the shape of the stone-work in a plate-traceried window; no one can help noticing it in a Perpendicular window. The proportion of the solids to the voids has radically changed, and with it the strength of the impression that they relatively make. Coerce our eyes as we will in front of a Perpendicular window, we cannot help seeing, instead of the nicely proportioned little lights, an embroidery of dark lines, almost always meager and often very thin and ugly, disposed upon a luminous surface.

M. G. van Rensselaer.

¹ A two-centered arch is formed by segments of two intersecting circles; when it is designed these circles must be imagined in their entirety, and their centers marked. But in a four-centered arch each side assumes two different curves, and four centers must be established when it is drawn. All the pointed arches of earlier times are two-centered, no matter what their proportions. But in the late-Decorated period the "ogee arch" with a reversed curve towards the apex was introduced. This form persisted in France but was little used in England. Here it is rarely found on a large scale, although an example is seen in the main exterior molding above the east window at Gloucester. In the true Perpendicular arch the change in curvature comes not near the apex, but near the springing-point; and the individuality of the form grows more and more pronounced with the lapse of time as

it assumes proportions which are more and more "depressed." Compare in this respect the earlier Perpendicular arch in the screening of Gloucester's south transept-arm with the later one in the north transept-arm.

² See "Lichfield Cathedral," *THE CENTURY MAGAZINE*, July, 1888.

³ This development meant a growing skill in the drawing of the figure, and it has been held by some writers that it was the wish to display this skill which led to the abandonment of the curved irregular lights of the window-head. It seems to me, however, as though the figure-painter lost more than he gained by the introduction of Perpendicular designs: he gained in the window-head, but lost by that subdivision of the lower field which gave him indeed a chance for many figures, but prescribed a small size for them all.

PREHISTORIC REMAINS IN THE OHIO VALLEY.¹

OF the many prehistoric remains of America none are of greater interest than the embankments, forming squares, circles, and other figures, in the Ohio Valley. All through the Mississippi Valley, however, are found works of a similar character, as well as along the many tributaries of this great water route, by which a people from the south could have reached, and probably did reach, the central and eastern portions of our continent. Everywhere, from the Gulf northward to the Great Lakes, and even beyond them in the Northwest, as well as eastward to the Alleghanies and to the Southern Atlantic coast, are earthworks which have much in common with those of the Ohio Valley when the latter are considered as a whole. In Ohio, and particularly in the valleys of the Muskingum, the Scioto, Brush Creek, the Little Miami and the Big Miami, and along their tributaries, are many "prehistoric monuments," or earthworks and mounds, of singular forms and of unquestionable antiquity. Associated with these are mounds and works of later times, some of which were made by the historic tribes or their immediate ancestors. Studied as a whole this valley affords undoubted evidence of successive occupation by different peoples, some of whom probably made it a brief abiding-place, while others were lost by absorption, or, possibly in some instances, were driven out by their successors. The fortified hills and other defensive works in the valley suggest many a long struggle, while the admixture of crania of different forms in some of the burial-places is evidence of the mixing of different peoples; and what more likely than that of the conquered with the conquerors? A discussion of the complicated and much-disputed question of the unity or diversity of the Americans would lead far away from the special subject of this paper, and it is only essential for the present purpose to recall a few important points bearing upon the archæology of the Ohio Valley.

First of all we must remember that this valley was inhabited by man at a period so remote as only to be approximately stated in years; but that at least ten times ten centuries have passed away since the implements of stone, fashioned by this early man, were lost and covered by the overwash of the glacial gravels as the great ice-sheet melted in its retreat to the north, and the rivers cut their way through the gravel it had deposited along its southern border. The discovery of such stone implements in the Ohio gravels was made by Dr. C. L. Metz of Madisonville, Ohio. These were found under the same conditions, and in gravels of the same geological age, as those previously discovered in the Delaware Valley at Trenton, N. J., by Dr. C. C. Abbott, who was the first to find and recognize the works of paleolithic man in the gravel-beds of eastern America. Since the discovery in the Ohio gravels, Mr. Hilborne T. Cresson of Philadelphia has found a chipped stone implement in the gravel-bed of corresponding formation, on White River, in Indiana.² The mastodon and the mammoth were the contemporaries of this paleolithic man, and from the distant time of his advent to the present successive peoples have inhabited the Ohio Valley.

IMPLEMENT CHIPPED FROM A PEBBLE OF BLACK CHERT, FROM OHIO GRAVEL EIGHT FEET FROM SURFACE. SIDE AND FRONT VIEW. HALF SIZE.

The evidences of a more recent past are the old village sites with their shell heaps or refuse piles, the earthworks of various shapes, the burial-places, and the fortified hills. Besides these are the mounds of earth, or of stone, marking the graves of leaders among the people, or indicating a tribal or a family burial-place, or, perhaps, a sepulcher of those who fell on some important occasion, as may sometimes be told when the mound is examined and its contents carefully studied. These tumuli are thus of different kinds, and the condition of the remains found in or under them, with the more or less

¹ With the exception of the "implement chipped from a pebble," the original of which is in the Peabody Museum at Cambridge, the illustrations in this preliminary article are redrawn, by permission of Prof. S. P. Langley, from "Smithsonian Contributions to Knowledge."

² Mr. Cresson has also found several stone implements in the older, or Columbia, gravel in Delaware. This discovery implies that man lived in the Delaware Valley at a time long preceding the deposition of the great mass of gravel upon which the city of Trenton is built.

marked changes which have taken place in the constituents of the structures themselves, shows that some are very much older than others. Often near these sepulchral monuments are extensive cemeteries of which there is no sign on the present surface of the ground, but on removing the dark soil formed by the decay of vegetation during many centuries, a former surface is reached on which are piles or rows of stones marking the graves. In other places, sometimes near and in other instances having no connection with mounds of earth or stone, are cemeteries of other kinds. In some there can still be seen, partly buried by the dark soil, the stones placed around or over graves; or again, there are large burial-places with no external sign of the hundreds and even thousands of skeletons that lie buried in the dark soil or in the clay below it, according to the thickness of the soil at the particular spot.¹

These several conditions and circumstances of burial show conclusively that the burial-places are of different periods, some quite recent and others very old, while others again are of times between. The differences in the modes of burial certainly suggest different customs, which presumably indicate a difference, greater or less, among the peoples of various times.

Bearing upon this point of different peoples we find that the prevailing form of the skulls from the older burial-places across the northern portions of the continent, from the Pacific to the Atlantic, is of the long, narrow type (dolichocephalic), while the skulls of the old peoples of Central America, Mexico, and the southwestern and southern portions of the United States are principally of the short, broad type (brachycephalic). Following the distribution of the long and short skulls as they are now found in burial-places, it is evident that the two forms have spread in certain directions over North America; the short or broad-headed race of the south spreading out towards the east and northeast, while the long or narrow-headed race of the north has sent its branches southward down both coasts, and towards the interior by many lines from the north as well as from the east and west. The

two races have passed each other here and there. In other places they have met; and probably nowhere is there more marked evidence of this meeting than in the Ohio Valley, where have been found burial-places and sepulchral mounds of different kinds and of different times.² This variation in the character of the burial-places agrees with the skulls found in them. Some contained the brachycephalic type alone; in others, both brachycephalic and dolichocephalic forms were found with many of the mesaticephalic or intermediate form; indicating a mixture of the two principal types, which seem to be of different races or subraces, notwithstanding that several writers, whose opinions must have weight, regard all the native people of America — most, however, excepting the Eskimo — as of one race.

That there is now a certain uniformity in characters and customs among all the native peoples, even including the Eskimo, is unquestionably the case. This degree of uniformity, we can readily believe, may be the result of long contact of two or more distinct races, brought about by intertribal communication, by warfare, by absorption or by union, as well as by the subdivision of tribes, which, as the centuries rolled on, probably have met and separated, again and again, in the vicissitudes of war, or from the necessities of life, or in wanderings over the land. A certain uniformity would thus in time be brought about. But that there was only a single race originally upon the continent, and that an autochthonous one, or, as other writers would have us believe, a group of the "one race of man," from which all the differences in physical characters, as well as of language, customs, and arts, have been developed, seems more difficult of conception when the diversities are studied with as much care as the resemblances have been. So many great and primary differences offer themselves for our consideration that if we give to the facts their true significance we seem compelled to admit, for the present at least, the following groups of North Americans, to each of which the term race or variety may be applied, according to the more

¹ During the explorations in the Little Miami Valley by Dr. Metz and myself, conducted for the Peabody Museum of American Archaeology and Ethnology at Harvard University, we found over fifteen hundred graves in one cemetery, and several hundred in each of the others, and have not yet completed the exploration of any one of these three burial-places.

² The late researches of Professor Virchow, in relation to the ethnology of Egypt, are of particular interest in connection with the corresponding facts in America. Professor Virchow has called attention anew to the existence of the early stone age in Egypt, or the paleolithic man of the Nile Valley. After him came the short-headed race of the ancient Egyptians, with which the Egyptian sculptures agree; then the long-headed

race. But with this change of race the peculiar character of early Egyptian art has been retained.

The comparison may well be made in America. Here was also paleolithic man; here also a short-headed early race, far advanced in the arts, and in the early stages of hieroglyphic writing, with a well-organized social system, and a priesthood of great power — the Mexicans, Central Americans, and Peruvians. Here also was a long-headed race which came into contact with a branch of the more highly developed race; and here we have the mixture of to-day, the Indians, agreeing in many things among themselves, yet widely differing in physical character, in their arts, and in language; and among these we find the survival of ancient arts and customs.

or less restricted sense in which we use the term race.

I. The Preglacial or Interglacial race, or Paleolithic man, probably with small oval heads. This race may have been autochthonous, or a very early migrant from northern Europe; and it may have become mixed, in later times, with numbers two and three; otherwise its descendants cannot be traced.

II. The "Eskimo," with long heads. This may have been an early offshoot of number three, or a distinct race early migrating from the old world, and probably very early mixed with number one.

III. The Dolichocephali of the northern and coast regions, bordering on the Eskimo and spreading southward. Early emigrants, probably originally from the northern portions of Asia, and probably mixing somewhat with number two, and unquestionably largely with number four.

IV. The Brachycephali of the southwest. Early emigrants, probably from Central and Southern Asia, extending eastward and northward in North America, and mixing with number three; while in South America it extended down the coast and into the interior, mixing with a dolichocephalic Andean race.

These groups, call them by what name we will, are the principal ones in North America—though there are possibly others that will find places here and there, as for instance the Caribs in the Gulf region—from which are composed the Americans, or, as they are called, the Indians, with all their resemblances and differences. With this understanding, should we use the term "Indians" as coequal with that of "native tribes of America," we can then accept the belief that out of all these elements there has at last resulted a certain uniformity in the physical characteristics, and an amalgamation of myths, customs, and arts, which have virtually brought about a distinct American race or variety of man; just as it is claimed that the white man in America is slowly but surely assuming marked physical and mental characteristics, which, in time, as the absorption and amalgamation go on, will result in forming a distinct group within the race.

A CENTURY ago a little band of pioneers, under the leadership of General Rufus Putnam, floated down La Belle Rivière and landed at the mouth of the Muskingum, where they made the first permanent Anglo-American settlement in the great Northwest territory. When they

landed they were met by a number of Indians of the Delaware tribe who had come to trade at the neighboring military station of Fort Harmar. The Wyandots, Delawares, and Shawnees, as well as the Mingoes, Miamiis, Chippewas, Ottawas, Pottawattamies, Sacs, and Senecas, had towns in various parts of the territory between Lake Erie and the Ohio. The Wyandots claimed that the Shawnees were living on the lands by their permission and did not own the land; and the Iroquois claimed much of the region by right of conquest, and accordingly took part in the treaties with the whites. With few exceptions the Indian towns were back from the Ohio River, on the south as well as the north, all the way down to the Big Miami. Hildreth, in his "Pioneer History of the Ohio Valley," calls attention to this fact, and says that the traditions of the Indians show that the Iroquois, their merciless enemy from the north, invaded the country along the river and drove them from its banks.

The white settlers, while well acquainted with these facts, had no knowledge of the predecessors of the Indian tribes of the valley, and little thought when they landed at the mouth of the Muskingum that they were to lay the foundation of a city over the very ruins of the homes and sacred altars of another race, who, many centuries before, had been a numerous people in the valley. When these ancient works at Marietta were first seen by the settlers they were covered with a heavy growth of forest. Harris, in his "Tour to Ohio," in 1803,¹ quotes the following statement

ANCIENT EARTHWORKS AT MARIETTA, OHIO.
(FROM A LITHOGRAPH FROM A PICTURE, AND FROM
THE SURVEY BY WHITTLESEY.)

from the Rev. Dr. Manasseh Cutler, who was in Marietta a hundred years ago. Says Dr. Cutler:

When I arrived the ground was in part cleared, but many large trees remained on the walls and

and Davis's volume, gives a better idea of the works. For details the two drawings should be compared with the survey by Whittlesey, in "Ancient Monuments of the Mississippi Valley."

¹ Published in Boston in 1805. This volume contains a bird's-eye view of the ancient works, reproduced in Winsor's "Narrative and Critical History of America," Vol. I. In several respects an early painting, copied by Sullivan for the frontispiece of Squier

mounds. The only possible data for forming any probable conjecture respecting the antiquity of the works, I conceived, must be derived from the growth upon them. By the concentric circles, each of which denotes the annual growth, the age of the trees might be ascertained. For this purpose a number of the trees were felled; and, in the presence of Governor St. Clair and many other gentlemen, the number of circles was carefully counted. The trees of the greatest size were hollow. In the largest of those which were sound there were from three to four hundred circles. One tree, somewhat decayed at the center, was found to contain at least four hundred and sixty-three circles. Its age was undoubtedly more than four hundred and sixty-three years. Other trees in a growing state were, from their appearance, much older. There were likewise the strongest marks of a previous growth as large as the present. Decayed stumps could be traced at the surface of the ground, on different parts of the works, which measured from six to eight feet in diameter. In one of the angles of a square a decayed stump measured eight feet in diameter at the surface of the ground; and though the body of the tree was so moldered as scarcely to be perceived above the surface of the earth, we were able to trace the decayed wood, under the leaves and rubbish, nearly a hundred feet. A thrifty beech, containing one hundred and thirty-six circles, appeared to have first vegetated within the space that had been occupied by an ancient predecessor of a different kind of wood.¹

This of course gives only the minimum age since the works were deserted, and probably will not exceed six to eight hundred years. How many forest growths had preceded this we cannot tell; we only know that in many instances ancient mounds and earthworks in the Ohio Valley were cleared of forest growths

of the same character and apparently of the same age as those about them, which we call the primeval forest. The deep deposit of dark soil or vegetable mold upon the sides and summits of the banks of clay also gives a record of many centuries.

Alas that hardly one of these ancient earthworks is left in its entirety! Here and there the more massive walls have resisted the plowman, and portions of others have been permitted to stand untouched. A few might yet be saved from further destruction, and, with some portions judiciously restored, might be preserved. Can we not do something to perpetuate these simple tokens of another race for the study of future generations in this land which we call ours only by the right of might, as others in the past have called it theirs?

Particular attention is directed to this group of earthworks at the mouth of the Muskingum; not only because they were sketched and described at a comparatively early time, but from the fact that they are the most easterly of the great works in Ohio. There are, however, many inclosures and mounds of various kinds still farther eastward, as well as in all other directions from the Ohio River. The largest conical mound in the valley is at Grave Creek, near Wheeling, West Virginia; another, nearly as large, at Miamisburg, in the valley of the Big Miami, is the most westerly monument of considerable size in Ohio. The next group to which it is important to call attention is near Newark, at the forks of the Licking, the western tributary of the Muskingum, sixty or seventy miles northwest from the Marietta works. As will be seen

¹ Of late years several writers have brought forward many arguments showing anew, what every archaeologist of experience knows, that many of the mounds in the country were made by the historic tribes. This has been dwelt upon to such an extent as to make common the belief that *all* the mounds and earthworks are of recent origin. Some writers even go so far as to imply that tree growth cannot be relied upon, and state that the rings of growth do not represent annual rings. As I am firmly convinced that many of the mounds and earthworks in the Ohio Valley examined by Dr. Metz and myself are far older than the forest growth in Ohio can possibly indicate, it matters little about the age of the trees growing over such mounds. However, as such a forest growth gives us the minimum age of these ancient works, it is important to know what reliance can be placed on the rings. In his report for 1887, Prof. B. E. Fernow, Chief of the Division of Forestry in the United States Department of Agriculture, discusses the formation of the annual ring, when speaking of tree growth. In a letter recently received from him, in which he points out the probable cause of error in counting the rings of prairie-grown trees, he states that he considers "anybody and everybody an incompetent observer of tree growth who would declare that, in the temperate zones, the annual ring is not the rule, its omission or duplication the exception."

Having received repeated assurances to this effect from other botanists, I recently again asked the question of Prof. C. S. Sargent, Director of the Arnold

Arboretum, from whom I received the following reply: "I have never seen anything to change my belief that in trees growing outside of the tropics each layer of growth represents the growth of one year; and as far as I have been able to verify statements to the contrary, which have appeared of late years, I am unable to place any credence in any of them. The following sentence, quoted from the last edition of Professor Gray's 'Structural Botany,' covers the case: 'Each layer being the product of only a year's growth, the age of an exogenous tree may in general, be correctly estimated by counting the rings of a cross section of the trunk.' I believe, therefore, that you are perfectly safe in thinking that Dr. Cutler's tree is something over four hundred and fifty years old."

Another matter worthy of careful consideration in regard to the antiquity of many of the large earthworks in the Ohio Valley, first suggested by Prof. M. C. Reed of Hudson, Ohio, is the theory that these works may have been made before the forest had encroached on the great alluvial plains where the works are commonly situated. When we recall the fact that the valley was certainly inhabited by one race at the close of the ice period there, and that a long time must have elapsed before the rivers cut their way to their present channels, and before the forest growth could have covered the old river beds, there seems to be much that is suggestive in this theory; and I have certainly observed some facts in the Little Miami Valley which apparently confirm it.

by the accompanying plan of the principal embankments,¹ there are many complicated structures, covering an area about two miles square. Many of the walls or embankments were probably not over four feet in height. Those forming the square, the octagon, and the smaller circle were nearly six feet high. The

situated at the mouth of the Scioto, and are known as the Portsmouth works, although the group extends for two or three miles on the Kentucky shore as well as on the Ohio side, embracing over twenty miles of embankment. Here were about eight miles of parallel embankments,³ resembling those of the Newark works, with a square, circles, and other figures. On the Kentucky side is a beautiful conical mound, surrounded by a deep ditch, outside of which is a high wall. This closely resembles the conical mound, with its ditch and wall, connected with the Marietta works and preserved in the city cemetery.

ANCIENT EARTHWORKS NEAR NEWARK, OHIO.
(AFTER A SURVEY BY WHITTLESEY; SQUIER AND DAVIS.)

larger circle has an embankment twelve feet high and fifty feet wide at the base, with a ditch around the inside over thirty feet wide and seven feet deep. At the entrance the walls are sixteen feet high, and the ditch is here thirteen feet deep. These figures give an idea of the magnitude of this complicated earthwork, which is also of particular interest on account of the singular structure within the "great circle."² Here a group of four mounds is so arranged as to constitute an unbroken outline having somewhat the appearance of a bird with spread wings. In front of this group is a low crescent-shaped embankment about two hundred feet in length.

Near this most northerly of the important ancient works in Ohio is an effigy mound, known as the "alligator," situated upon a headland nearly two hundred feet high. The effigy is about two hundred feet long, and forty feet wide across the body, with legs about thirty-six feet long. Near one side of this figure is a pile of burnt stones designated as the altar.

The third important group of ancient works to be referred to is about one hundred miles southwest from Marietta and about the same distance south of Newark. These works are

of an animal, and more like an elephant or a mastodon than any other. Still farther up the Scioto, particularly for several miles below and above Chillicothe, are many earthworks of various kinds—squares, octagons, circles, crescents, and parallels, with many hundred mounds. Along Paint Creek, the western tributary of the Scioto, are many more inclosures and mounds of a similar character.

Some fifteen to twenty miles south of the Paint is the east branch of Brush Creek, which, flowing south, enters the Ohio about thirty miles below the Scioto. In this southern portion of Ohio the country is broken and hilly, reminding one more of New England than of the country to the westward. The branches of Brush Creek have their source among these hills, and in the valleys are several earthworks and a number of mounds. One of the highest of several hills along the East Branch is known as Fort Hill, on account of the wide and high wall of stones, inclosing an area of forty acres, raised in ancient time around its summit. This artificial wall, in many places twelve or more feet in height, joins the precipitous sides of the hill, and, like them, is thickly covered with forest

¹ After a survey by Colonel Whittlesey; from Squier and Davis's "Ancient Monuments of the Mississippi Valley." "Smithsonian Contributions to Knowledge," Vol. I. (1848).

² This is not a true circle, as the diameters are 1150 by 1250 feet, according to Squier and Davis, whose measurements are here followed. They also state that the distance between the deep ditches at the entrance is eighty feet. "Here, covered with the gigantic trees

of a primitive forest, the work presents a truly grand and impressive appearance" (p. 68). Mr. Middleton has made a recent survey of this group, and gives the diameter of the "great circle" as 1186 by 1163 feet. For a discussion of these measurements see paper by Dr. Cyrus Thomas of the Bureau of Ethnology, Smithsonian Institution, 1889.

³ Portsmouth is built over a portion of the embankments now destroyed.

trees, from among which many a noble oak has been brought low by the woodman's ax, as shown by stumps¹ still standing upon the walls.²

Following down the East Branch some eight

FORT HILL, HIGHLAND COUNTY, OHIO.

(FROM SURVEYS BY SQUIER AND DAVIS, AND BY OVERMAN.)

or ten miles its forks are reached, and just below them, on the east side of the creek, is a headland which juts out, a scraggy, rocky ledge, a hundred feet above the level of the waters of the creek. An overhanging cliff, seventy-five feet above the hillside, forms the upper part of this great mass of rock, and it requires but little imagination to trace in the terminal outline of this ledge the form of the head and open jaws of a huge serpent.³ On the sur-

¹ One of these stumps measures seven by nine feet in diameter two feet above the wall upon which the tree grew, and it was cut down at least fifty years ago.

² The Western Reserve Historical Society of Cleveland is endeavoring to raise a fund for the purchase and preservation of this interesting fortification, and

face of this headland, a short distance from the bare ledge, begins the great earthwork now everywhere known as the "Serpent Mound."

Following Brush Creek some thirty or forty miles, as it winds its way to the Ohio, several mounds and a few small earthworks can be seen. Still farther to the west, in what is now the southwestern corner of the State of Ohio, are many ancient works of the same general character as those in the Scioto Valley. On the site of the city of Cincinnati, about seventy miles from Brush Creek, were inclosures and mounds, and in the valley of the Little Miami are many works of remarkable interest. In one group in particular much of importance was found relating to the sacred customs, the arts, and the conditions of the people who formed the ancient works to which special reference has been made. In this valley, too, is "Fort Ancient," the largest of the works known as fortified hills, where an embankment four miles in extent, with numerous openings, surrounds the hill and incloses an area of about one hundred acres. In the valley of the Big Miami are many more inclosures and earthworks of various kinds, with another fortified hill, which has a complicated system of walls at the entrance of the fort. These are the most westerly of the ancient works in Ohio, and the last to which reference can now be made.

With this brief preliminary of some of the important points to be kept in mind in a study of any one of the ancient works of the Ohio Valley, we can proceed, understandingly, to the special consideration of the Serpent Mound, a unique structure situated in the midst of this great system.

it is to be hoped that success will soon attend its efforts in this most laudable work.

³ This resemblance was first noticed by Dr. Peet in the "American Antiquarian," and was afterwards elaborated by Mr. Holmes in his sketch of the cliff published in "Science" Vol. VIII., p. 627 (1886).

F. W. Putnam.

IN MEMORY OF FATHER DAMIEN.

MORE royal than the minever of kings
The robe of tortured flesh that clothed his soul,—
The martyr, reaching out an eager hand
To clasp the cup of bitterness and dole.

And lo! we see through tears the signs divine
Of sainthood that the ancient tales repeat.
Stigmata were the loathsome ulcer-wounds
Disease had marked in holy hands and feet!

Anne Reeve Aldrich.

THE "MERRY CHANTER."

BY FRANK R. STOCKTON,

Author of "The Lady, or the Tiger?" "Rudder Grange," "The Hundredth Man," etc.

XVIII.

THE CAPTAINS SPEAK.

HE next morning Doris spoke her mind to the captains.

"We must do something," she said. "If we can't do one thing, let us do another. We must set sail for Boston without delay."

"Madam," said Captain Garnish, "Dolor Tripp's trunk is still on board, and no matter what happens, we cannot sail until she sends for that."

Doris stamped her foot impatiently.

"What a thing to wait for!" she said.

Half an hour afterwards a man with a cart appeared on the shore, and hailing the ship, he shouted lustily that he had come for a trunk. Two of the captains took the trunk to him in the boat, and when they returned we noticed that each of them heaved a little sigh.

"Now the last link is broken," remarked Doris.

"There are some links," said the butcher, "that are mighty hard to break."

Doris looked at him compassionately. She thought he referred to the link between himself and Dolor Tripp, but I knew that he meant the link between the bottom of the *Merry Chanter* and the sand bank.

It was now plain to me that the captains felt that matters had come to a crisis, and that they must either do something or say something. For an hour they held a conference in the fore-castle, and then they came aft in a body.

Captain Timon, being the oldest, spoke first.

"We captains," said he, "have been considerin' a lot about this ship, and as the owners, and perhaps the passengers that are left, may be gettin' a little worried about the longishness of our v'yage to Boston, we feel—and it's no more than right to let 'em know it—that sailin' to Boston in this vessel is n't what we call plain sailin'. This is an old vessel, and she's been lyin' in the dock so long that her hull is a good deal more barnacle than it is timber. Now it's pretty nigh impossible to sail a ship when her hull is more than half barnacles. Of course most of the barnacles could be scraped off at low tide, but

if we did that we'd open the seams of the old schooner, and she'd leak like a flour-sieve."

"Why did n't you tell us this before?" cried Doris, indignantly.

"Well," said Captain Timon, slowly, "you was the owners, and you wanted to go to Boston, and we would have sailed you there if we could have done it."

"And there's another thing," said Captain Garnish. "Them pavin' stones in the hold is too heavy for this vessel; they sink her too deep. Of course we could go to work and throw them out, but I've followed the sea pretty nigh all my life, and I know that it would n't be safe to take this schooner outside the bay with a pound less ballast in her than she's got in her now."

"This should certainly have been told to us," said Doris, very sternly.

"There's another p'int," said Captain Teel, "that might be overlooked by people that ain't sailors. This ship is short-handed. Of course there's enough of us aboard to sail her in fair weather, and when we cleared for Boston we thought that the spell of fine weather we was then havin' would more than likely last to the end of the v'yage. But there's no knowin' what sort of weather we are likely to have now, and if we was to be beatin' up the coast in a heavy gale, and if one of us was to be at the wheel, and another on the lookout, and another castin' the lead, and another battenin' down the for'ard hatches, it stands to reason that there would n't be nobody to take in the topsails."

Doris was flushed with anger, and I was on the point of bursting out into uncontrollable vituperation, when Captain Cyrus, with a smiling face and pleasant voice, spoke up.

"What we cap'ns want to do," said he, "is to be fair all 'round. We want to be fair to you, and fair to ourselves. Now here's Cap'n Timon, Cap'n Garnish, and Cap'n Teel, that's all got houses of their own, which they've let furnished by the month to summer visitors. Now if we had sailed straight from Mooseley to Boston we'd have been there and back before the month was out, and these three cap'ns could have been on hand to collect the advance rent for another month, either from them tenants or some others. But as things is, and is likely to be, it don't stand to

reason that we can get to Boston and back before the end of the month. Now I am not speakin' for myself, but for my mates. I 've got a house and it 's furnished, but I can't let it, for there is no knowin' what time Mrs. Bodship might want to come there, and it would n't do for her to find a tenant in it. So you see it 's not my interests I 'm speakin' for."

Doris could not say a word, but my anger broke forth.

"You miserable, old, salt-pickled fisherman!" said I, "why don't you speak the truth and be done with it? You know that you have run our vessel aground and you can't get her off. I could have sailed her better myself."

Captain Garnish advanced with flashing eye and clenched fist.

"Young man," he roared, "if you had n't your wife with you, I 'd show you the difference between a pickled fisherman and a live clam!"

The butcher now stepped boldly between the captains and the owners.

"No more of this," he said. "I am only a passenger, but so long as I am on this ship there 'll be no fighting on board of her."

The butcher owned a cleaver, and his words were respected.

Doris rushed down to her cabin, where she burst out crying, and I followed her. We had rather a doleful time together; but after a while we heard the cheery voice of Griscom Brothers, who had come on board for his daily visit, and we went on deck. After his usual hearty salutations to us all, the baker addressed the butcher:

"Lord Crabstairs sent a message to you. He said he has n't no use for chickens now. He told me to tell you that, expecting to spend most of his spare time till he gets married in going backward and forward between the village and the Tripps' house, he makes a present of all his poultry to you, knowing that you will take good care of it."

"If Lord Crabstairs thinks," said the butcher, "that what has happened is going to be covered up by eleven full-grown hens and a year-old cockerel, he has mistaken his man; but if he just wants to give them to me as plain fowls from one man to another, I 'll take them and send him thanks."

"That 's what he meant," cried Griscom Brothers. "He as much as said so to me; and so you can just pitch in and feed them, for they are yours."

Looking about him as he was speaking, Griscom Brothers perceived that something had happened, and that all was not right with us. He was about to speak, when I led him aside and explained the situation.

"That 's a pity; that 's a great pity," said he, shaking his head. "It 's a bad thing to have ill-feeling break out among people who are voyaging together on a ship, but we must see what can be done to straighten out matters."

Before, however, he could offer any suggestions to this end, the butcher came aft with a message from the four captains. I was not on very good terms with the butcher, but he spoke pleasantly to me as well as to Doris. He informed us that the captains had decided that, on the morrow, they would return to their homes by land in order to attend to their private affairs. If, after the end of the month, it would be considered advisable not to endeavor to take the *Merry Chanter* to Boston, they would be content with their share of the money paid by the passengers, and would relinquish all further claims upon the schooner.

"In that case," said Doris, "we must go on shore, also."

"It is base conduct on the part of the captains," said I. "I do not object to go on shore, but I object to being forced to do so by their desertion of our ship."

"The ship shall not be deserted," said the butcher. "I shall remain on board. I have all my belongings here, and I am very comfortable. I have my poultry to take care of and plenty of things to do; and as I can go on shore in the boat whenever I feel like it, I am not afraid to be here without sailors, for I don't believe any storm that could come into this bay could move the *Merry Chanter*. However, I shall keep the anchor out, for the sake of appearances. It does n't mean any more than 'esquire' to a man's name, but it looks well. Now how does that plan strike the owners?"

Doris declared that if the butcher really desired to stay on the ship, we should be very glad to have him do so.

"In that case," said Griscom Brothers, "if you want Johnny to stay with you, he can do it; but if you don't want him, I 'll take him home and set him to baking. It is time he was in some solid business. And as for you, madam, and your husband, if you want to stay around in this neighborhood, there is the Tripp house. There 's plenty of room in it, and I believe Alwilda and Lizeth would like you to board with them for a while."

"That would suit me exactly," said Doris. "I wish to be somewhere where I can see the *Merry Chanter* whenever I choose to go and look at it."

"That 's quite natural," said Griscom Brothers; "and we had better call this business settled. And now I 'll go ashore, and engineer the matter with Alwilda and Lizeth. I know I can do it."

The next day the four captains, being ready to go before we were, came in a body to take leave of us.

"We don't want to go away," said Captain Timon, speaking for the others, "without sayin' to you both that we part, on our side, quite friendly. Bygones is bygones. If we could have got you to Boston, we would have got you there, and been glad of it. But we could n't and we did n't, so there 's an end of it. If you ever get your ship floated, and towed into fresh water where her barnacles would drop off, and have her fitted up so that she won't need so many pavin' stones, we might be willin' to ship on her again, and see what we could do to get her to Boston for you. But till that time comes, we bid you good-by. And here 's our hands, wishin' you good luck and lots of it."

Doris shed some tears as she shook hands with the four old mariners; and although my sense of personal dignity demanded that I should not take their hands, I did so for fear of further annoying my wife.

In the afternoon Doris and I also left the *Merry Chanter*,—temporarily, as my wife earnestly declared,—and repaired to the house of the Tripp sisters, who were perfectly willing to accommodate us until we determined what it should be best for us to do.

The schoolmaster went home with his father, who vowed to protect him against Mrs. Bodship at all hazards; and the butcher was left alone on board the *Merry Chanter*.

XIX.

HORRIBLE SEA-WEEDS FLAP OVER HER.

OUR days with the Tripp family passed pleasantly enough. I went fishing, and sometimes Doris went with me. Doris went sketching, and sometimes I went with her. Dolor Tripp was in high spirits, and her sister Lizeth developed quite a pleasant humor. Lord Crabstairs spent every day, and the greater part of every evening, in the company of his beloved one; and, consequently, he was a good deal in our company, and seldom failed to make things lively in one way or another.

Griscom Brothers was a regular visitor. He had not yet arranged to leave his quarters over the old kitchen, and generally spent the nights there, giving up his room in the village to his son. He did not altogether relinquish his line of business as a ghost, especially when he had reason to believe that on account of moonlight walks or late departure of a visitor some outer door had been left unfastened. In his wanderings about the house he frequently deposited some delicacy in his line at the door of the room occupied by Doris and myself,

and I am sure that in this regard Dolor Tripp was not forgotten. The butcher could be depended upon for a visit at least every second day. Occasionally the schoolmaster came, but he was a quiet man who did not care to do much walking about the country.

In about ten days after our arrival, Dolor Tripp and Lord Crabstairs were married. A clergyman came over from the village, and we had a very pleasant little wedding, which was made more cheerful by Alwilda, who, as soon as the ceremony was completed, proceeded at once to the dining-room, and changed the color of the blue house in her latest picture to bright yellow with scarlet window-frames. After a banquet, in which the talent of Griscom Brothers shone to marvelous effect, the happy couple proceeded on their wedding trip.

About a week after the wedding, Doris and I were down at the edge of Shankashank Bay. Across the stretch of water that separated the *Merry Chanter* from the shore Doris and the butcher were holding a high-pitched conversation, when this voice-destroying dialogue was cut short by the arrival of a boy in a funny little cart resembling a wooden wash-basin on wheels, who brought us a telegram from the nearest station. This message was from Montreal, at which place we knew the newly married couple intended making a considerable stay. It was from the young bride, and it read thus:

"I am shipwrecked, and lying drowned upon the shore, cold and dead. Horrible sea-weeds flap over me. He will write.—DOLOR."

With pallid cheeks Doris and I read this again and again, but what it meant we could not divine. We knew it meant misery of some sort, but what sort of misery neither of us could imagine. At last, not knowing what to do, we determined to take the butcher into our confidence, and hailed him to come ashore. In a few minutes his boat grated upon the sand.

He read the telegram, and looked as black as night. Doris whispered in my ear: "He must not go back after his cleaver. We must not let him do that!" In a few moments, however, the storm-clouds on the face of the butcher began to disappear.

"At first I thought," he said, "that that man had deceived her; that he 's not a lord. But, considering that he did n't want to be a lord, and put on no airs about it, I don't believe the trouble is there."

"But whéré is it?" said I.

The butcher shook his head.

"It 's no use going to them," he said, "until we know what has happened. We must wait for the letter."

"Do you think of going to them?" asked Doris in surprise.

"Certainly," said the butcher; "if I am needed."

That was a doleful day for us. We felt obliged to tell the Tripp sisters of the telegram, and the effect of the mysterious message was to throw Lizeth into a fit of grumbling that Dolor should be so foolish as to stir them up with a telegram like that when a letter was on its way, and to send Alwilda into the dining-room, where she began work upon an enormous tombstone, large enough to contain the names of all her family.

The butcher went to the village, where he said he would stay until a letter came, and then bring it to us forthwith. Griscom Brothers was taken into council, and he declared it was his opinion that it was clams. Dolor would be sure to call for them, and as the Canadians were not a clam-eating people they probably did not know how to cook them. Nothing would be more likely to give rise to a telegram like that than a quantity of badly cooked clams. He felt keenly on this point, for he knew how clams should be cooked so that they would hurt no one, and had he been in Montreal the case might have been quite different.

The next day at noon, the butcher, who had staid in the village all night, leaving his poultry, the sandpiper, and the *Merry Chanter* to take care of themselves, brought a letter from Lord Crabstairs.

It was addressed to me, and read as follows:

MY DEAR SIR: I am sorry to be obliged to write to you that I have been knocked out of time worse than any man ever was since the beginning of the world. My wife sent you a telegram this morning, but she tells me she did not go into details, so I shall write you how matters stand, although it is not of the least use, except to make our friends unhappy. We stopped at Boston, because Dolor said that as she had originally started to go there she would like to do it, and she did me the honor to declare that she traveled with as merry a chanter as if she had sailed in your ship. Then she wanted to go to Montreal, and we went there; for I was not in the least afraid to travel in Canada, where I knew no one, and where I should register no name but that of George Garley, which I bore before I came into the title. Well, we saw the sights of Montreal, and they did us no harm. But one of the Cabinet Ministers happened to be in town, and they gave him a public reception, and of course Dolor wanted to go to that, and we went. A lot of heavy swells went in ahead of us, each with some sort of a title or other, and I noticed as Dolor heard these names called out she got more and more uneasy, and just as we were coming up to the scratch she took out of my hand a card on which I had written "Mr. and Mrs. Garley," and herself gave to the usher one of the cards which we had had printed for use in the States only. When we were announced as Lord and Lady Crabstairs we created a fine sensation, I assure you; for nobody of that rank had gone in yet, and I dare say

there is no duchess in England who can carry herself in better style and form than my little wife did. She was as proud as a gilded peacock, and I must say that I was a good deal that way myself. I had never had any good of the title, and I was glad something had come of it. Dolor was so particularly tickled by the deferential manner in which she was treated that I was ashamed I had ever thought of presenting the card of Mr. and Mrs. Garley. The next morning, when I went into the reading-room of the hotel, the first man I saw was that infernal attorney who had brought me the news, in front of my own door, of my accession to the title and the debts. It is of no use to write much about this; it is too beastly miserable even to think about. The wretched cad had found out I had gone to America, and the inheritors of the claims had sent him over to look me up. But he had not heard a bit about me until he saw in the morning paper that Lord and Lady Crabstairs had attended the reception the evening before. He had the papers, and he nabbed me on the spot, and now I go back to England to spend the rest of my life in a debtor's dungeon, and to think that my poor dear did it simply because she thought I ought to be as big a swell as any of them. I vow I wish I had done it myself. Well, it is all up. Life is all up. Everything is all up, so far as we are concerned. The whole world has gone to the bad. What is to be done, I cannot say. In a week I am to sail for England, but it is impossible for Dolor to go with me. She would not be allowed to share my dungeon, and I would not have her do it. Moreover, I could not endure to look through a narrow slit in the wall and see her wandering about the neighborhood, where she did not know one street from another, and wasting to a skeleton day by day. But how I am to go away and leave her, I know not. So here we are in blackest misery. By the eleven devils who continually howl around Judas Iscariot, I wish that the first Lord Crabstairs had been born dead!

Yours wretchedly,

CRABSTAIRS.

For the sake of Dolor, I stick to the title.

This letter was read aloud in the presence of the two Tripp sisters, Doris, and the butcher. When it was finished Alwilda and Lizeth arose without a word, put on their black-and-white striped sunbonnets, and went out—one to the dining-room, and the other to the poultry yard. Doris and I gazed at each other in silence, but the butcher stood up with flashing eyes and heaving breast.

"Who is to go to Montreal?" he said.

"To Montreal?" I repeated. "There's no use in any one going there in a case like this; there is nothing to be done."

"If no one else goes," said the butcher, "I shall go."

"That you shall not do," said Doris. "It would not be suitable or proper. I am going."

She went, and of course I went with her.

WE found the bridal couple in doleful plight. Lord Crabstairs was a prisoner in his hotel,

awaiting the departure of the steamer on which his passage had been taken. Poor Dolor was plunged in blackest grief.

"Of course you did not understand the telegram I sent," she sobbed. "It was n't half strong enough."

Her husband was a brave fellow, and tried to put the best face on the matter, especially when his wife was present.

"I dare say I shall have a bit of a jolly time now and then," he said, "and that things will not be quite as bad as we have been thinking they would be. I never speak to that wretched cad of an attorney about anything, but I have heard that they turn debtors into a court now and then to take the fresh air, and perhaps they'll let me keep chickens. That would be no end jolly! And, more than that," he exclaimed, his whole face lighting up, "who knows but that they'll let me have a cow? I know I could keep a cow in a stone courtyard, and if they will let me serve milk and eggs to the fellows in the other dungeons I would have lots to do, especially when it came to the collecting of the monthly bills."

This kind of talk may have cheered the poor man a little, but it did not cheer us. Our principal concern was for Dolor. We had read stories of the Fleet and the Marshalsea, and supposed it likely that Lord Crabstairs might in time learn to endure life in a debtors' prison; but Dolor would be an absolute stranger in England, and she could not be allowed to go there. So there was nothing for her to do but to return to her home.

We spoke privately to Lord Crabstairs on this subject, and he agreed with us.

"Of course that's the place for her," he said; "and I would rather think of her there than anywhere else, but there is one thing about it that worries me. I don't want her to go there if that butcher intends to live in the neighborhood. Not that I have anything to say against the butcher. He is an honest man and tossed up fair every time, and if at the last toss two tails had come up instead of two heads, perhaps he might have had her. But that's neither here nor there. Heads turned up, and there was an end to him."

Neither of us answered this remark. Doris looked as if she had something to say, but she did not say it.

"I will write to him," exclaimed Lord Crabstairs, "and put the matter fair and square before him. Then he will surely see it as I do."

"Anything like that," said Doris, somewhat severely, "you must certainly attend to yourself."

Lord Crabstairs wrote to the butcher and put the matter fair and square before him. On

the next day but one this answer came by telegraph:

"If her coming home depends on my going, I go."

"There is a man for you!" exclaimed Doris, with a slight flush on her face as she read this telegram.

I made no reply. The butcher was well enough in his way, but he was not a man for me.

Dolor knew nothing of the letter or the telegram. That evening she said to us:

"I have been thinking about going home. It will be perfectly dreadful with my husband snatched away to a living death, and every hope in life shattered and shivered, but in some ways it may be better than it used to be. I shall have more company. I dare say the *Merry Chanter* will not sail for ever so long, and I shall often see you two, and perhaps the captains, to say nothing of Griscom Brothers and the schoolmaster. The butcher too is a very pleasant man, and probably he will always live in the neighborhood."

At this Lord Crabstairs leaned his head upon his hands and gave a groan. Dolor stepped quickly to his side and put her arm about his neck.

"Poor fellow!" she said. "I wish I better knew how to help you to bear your misery! And to think," she suddenly exclaimed, standing erect, with her eyes sparkling with indignation, "the people who really owed these horrible debts, as well as the people to whom the debts were owed, have been dead so long that they have even ceased to be corpses!"

XX.

THE COLLECTOR OF ANTIQUES.

DORIS and I agreed to stay in Montreal until the very last minute, and when the steamer should be entirely out of sight we would return home, taking Dolor with us. To Lord Crabstairs we privately promised that before starting we would telegraph to the butcher.

Saturday was the steamer's sailing day, and on Friday morning the attorney came to Lord Crabstairs's room, where Doris and I were paying an early visit to the unfortunate couple. Lord Crabstairs had declared he would never again speak a word to this attorney, who had dogged him across the Atlantic. But this time he broke through his rule.

"What do you mean," he cried, "by this impertinence? Is it not enough to have one cur keeping guard outside the door without another pushing himself into the room?"

This harsh speech made not the least impression upon the attorney, who quietly

remarked: "Half an hour ago I received a message by cable concerning you which I did not in the least understand. But in picking up the morning paper I find this despatch from London, which is a curious bit of news, and may interest you." And handing a newspaper to Lord Crabstairs he stepped to one side.

Lord Crabstairs took the paper and read aloud the following news item:

Considerable interest has lately been excited with regard to the case of Lord Crabstairs, who recently succeeded, not to the estate,—for there is none,—but to the title of this ancient family. It is well known that his only inheritance was a vast mass of debts, some of which began to accumulate in the seventeenth century, and which were increased and multiplied by a long line of ancestors, so that many years ago it became impossible for any descendant of the house to pay them. In consequence of this unfortunate state of affairs the new Lord Crabstairs became liable to arrest at the moment of his coming into the title, and to be sent to the debtors' jail, where so many of his forefathers had passed their lives. The public has already been made aware that this new nobleman evaded the officers of the law and fled to America, where, in Montreal, he was recently arrested as an absconding debtor. The publication of the facts in the London papers attracted the attention of an American gentleman, Mr. Copley Westbridge, who has been for some time in Europe expending a large portion of his great fortune in collecting material with which to found an antiquarian museum in New York. Mr. Westbridge pays much attention to antiquities of every kind, and the case of Lord Crabstairs interested him greatly. He obtained permission to examine the vast mass of claims, bonds, defeasances, judgments, executions, warrants, mortgages, bills, writs of *elegit* and of *capias ad satisfaciendum*, and legal papers of every variety originating in the reigns, protectorates, and regencies of two centuries; and all so worded and drawn as to bear upon the unfortunate man who happened to be Lord Crabstairs, no matter in what period of time or part of the world. This mass of ancient and curious documents appeared so valuable to Mr. Westbridge that he bought the whole of it for his museum. The descendants of the original creditors consented to accept a fixed price for the collective debts, and Mr. Westbridge signed a quitclaim, which entirely absolved Lord Crabstairs and his descendants from any connection with the debts of his forefathers. By this transaction this unique and highly valuable collection of legal curiosities goes to the States, and a British peer is made a freeman on his native soil.

As Lord Crabstairs read this piece of news his voice became louder and louder, and I am sure the eyes of all of us opened wider and wider, and that our hearts beat faster and faster. Dropping the paper, Lord Crabstairs stepped towards the attorney.

"What is the message you received?" he shouted.

"It was very short," replied the attorney;

"merely these words: 'No further claims against your prisoner; release him.' Therefore, my lord, you are no longer under arrest. Good-morning."

With two shouts of wild ecstasy Lord and Lady Crabstairs rushed into each other's arms, and Doris and I quietly withdrew.

The gayest, happiest, and most madly hilarious three people in the Dominion of Canada that day were Doris and Lord and Lady Crabstairs. I, too, was wonderfully well pleased, but my pleasure did not exhibit itself in extravagant manifestations such as those of my companions.

"What are you going to do?" asked Doris of Lord Crabstairs as we all sat at luncheon together. "Are you going back to England? Have you any sort of an ancestral pile left to you?"

"I really do not know," replied his lordship. "I have never gone very deep into the beastly business. Whether there was an entail or no entail, there is nothing left, anyway. But if anything were left, I should have nothing to do with a stick or a stone that belonged to my ancestors, for fear that the American antiquarian had overlooked a paper or two, and that some sort of antiquated debt in geometrical proportion still stuck to the property. I own a neat little place in Bucks, and if everything has n't been scattered to the four winds, there is a cow there, and a lot of high-bred poultry, two dogs, and a cat, and some of the prettiest flower-beds you ever saw in your life. Lord and Lady Crabstairs will live there, and if the other lords of the realm think that my house is too humble an abode for a British peer they can smother their mortification until I make money enough to build a better one. I intend that the next house of the Crabstairs shall date from me."

It was decided that the best thing for us all to do was to return together to the Tripp house. We wrote at once to announce the good news of our coming, and we were met at the railroad station by a little crowd of friends. Lizeth Tripp was there, but not Alwilda, who would not leave the house unprotected even on an occasion like this. The four captains were there, and Griscom Brothers, and the schoolmaster, and very prominent among the others the butcher, wearing a freshly washed and starched gown, and a shining, high silk hat. Having heard that Dolor's husband was coming back with her, he did not think it necessary to leave the neighborhood. Behind this little group of friends stood the entire population of the village.

We walked to the Tripp house in a long procession, the baggage of the bridal pair

being gladly carried by the four captains, the schoolmaster, Griscom Brothers, and the butcher. The villagers followed us for a short distance only. They all knew what sort of a woman Alwilda Tripp was. The hired man had come down to the station, but he had hurried back ahead of us, and now stood at the open gate bearing a huge sunflower, which he presented to Lady Crabstairs.

"I don't believe there's another person in this world," said Lizeth, when we had reached the house, "on whom that man would have wasted nearly a gill of chicken seed."

We found Alwilda in the dining-room, standing before the huge tombstone she had painted on the wall. She quietly submitted to the embrace of her sister, and very civilly returned the salutations of the rest of the party.

"I am very much puzzled," she then remarked, "to know what to do with that tombstone. I don't want to scrape it out, because I took a great deal of pains with it, and yet, as things have turned out, it does n't seem to be suitable."

"Who is that sprawling nigger at the foot of the stone with his head in a brass pan?" asked Lord Crabstairs.

"By that," replied Alwilda, "I intended to represent the downfall of an African king."

At this we all laughed heartily, and Lord Crabstairs cried:

"Well, whatever you do, madam, paint out the nigger. He does n't suit at all. And if you want an inscription for your tombstone I'll give you one: 'Here lies two centuries of debt, and the devil take it!'"

"I might put that," said Alwilda, "except the part about the devil. I can have instead of it 'now departed.'"

"I think I can propose something better than that," cried Doris. "You can cut off the top of the gravestone so as to make it look like the base of a monument, and on this you can paint a handsome column or obelisk. You can make a flower-bed of the fallen African king, and pretty vines can twine themselves about the base of the stone. These, with blossoming shrubs and flowers on each side and in the background, will make a very cheerful picture. Then on the monument I propose you paint these words: 'To the memory of the good ship *Merry Chanter*, which'" — She hesitated a few moments, and then said: "I cannot think of a good sentiment. Will not one of you help me?"

Griscom Brothers smiled, and in a moment said:

"How do you like this? 'To the memory of the good ship *Merry Chanter*, which made slow time but fast friends.'"

"Capital!" said Doris. And we all agreed

that this would be an exceedingly appropriate inscription.

"I'll paint it in that way," said Alwilda. And immediately she went to work upon it.

XXI.

THE MERRY CHANTER LEAVES
SHANKASHANK BAY.

LORD and Lady Crabstairs remained with us at Dolor's old home for a week or more, and then started on a short western tour. When this continuation of their bridal trip was completed they would sail for England to take possession of their small estate in Buckinghamshire, where, as the humblest and happiest of all lords and ladies, they expected to build up a little paradise.

Every one of us was sorry to have them go, and each of us gave them some little memento: the butcher's present was a beautiful new cleaver of the best steel.

"This sort of thing," he said, "comes very handy in a kitchen."

And then speaking to me in an under voice he remarked:

"They say that sharp-edged tools cut love, but there are cases when this does n't matter."

The four captains brought queer things which they had picked up in distant lands, and Griscom Brothers put a little oyster pie in a tin can and told them they must think of him when they ate it in their own house.

"I do not need anything," said Dolor, "to make me remember the ghost who used to leave pies at my door."

"I have n't anything that will do for a memento," said Alwilda; "but I will paint your portraits from memory and send them to you."

"May the ship sink that carries them!" muttered the butcher.

The day after the departure of Lord and Lady Crabstairs, Doris and I walked down to the shore to look at our ship.

"Do you know," said Doris to me, "that I am very much afraid the *Merry Chanter* will never sail again. I don't believe the highest kind of tide will lift her now. She must have become a permanent portion of the earth's surface."

I had long been waiting for an opportunity to assert myself, and to make plain to Doris the value of my opinions and my decisions. I considered such action as due to my personal dignity, and had only postponed it because no proper occasion had appeared to offer itself. Now an occasion offered.

"There is no need of surmises on the subject," I said. "I have positively determined that that ship is not fit for navigating purposes,

and that we must give up all idea of sailing in her to any place whatever."

"I am glad you think so," said Doris, "because I was afraid I might have some trouble in convincing you that now we ought not to think of such a thing as taking voyages in our ship. But what shall we do with her?" she continued. "But here comes the butcher. Let us ask him."

The butcher, who had been rowing from the ship, now ran his boat upon the beach. When Doris had asked his advice upon the important subject under consideration, he stood for some moments holding his chin in his hand.

"I'll make you an offer," he said. "I like living on board the schooner. It suits me first-rate. She's got a splendid foundation, and will stand storms like a lighthouse. If you say so, I'll buy her of you."

My wife and I retired a little for consideration.

"There cannot be the slightest doubt about it," said Doris. "We should sell him the ship, for it is of no earthly use to us."

"Very well," said I; "let us sell it to him."

THE butcher bought the *Merry Chanter*, and with the purchase-money in our pockets Doris and I prepared to leave Shankashank Bay for a little inland town, where we would set up a home entirely unconnected with maritime pursuits.

On the morning of the day we were to leave we went on board the *Merry Chanter* for a final visit. The schoolmaster received us at the beach, and rowed us to the ship. As we stepped on deck the butcher, in whitest gown and blackest hat, received us with a sorrowful courtesy. Griscom Brothers was on board with the four old captains, who had come over purposely to bid us farewell. We were all there except the lively Lord Crabstairs and the pretty Dolor. The butcher thought it proper to allude to this fact.

"There is a gap among us, my friends," he said, "which we cannot fail to see. There are, however, other gaps, which are not visible," and he turned his face towards the sea.

Doris walked over the ship and bade good-by to everything. Her own old hen, followed by a brood of now well-grown chickens, came clucking towards her, doubtless remembering former dainty repasts. The other poultry crowded about her, hoping to be fed, and the sandpiper ran along the rail by her side, his little eyes sparkling with the expectation of a crumb.

She walked to the bow, and looked over at the wooden figure-head.

"Good-by, dear Merry Chanter," she said. "Whenever the winds are high, and I know there is a storm on the coast, I shall think of you bravely breasting the waves that rush in from the sea, and shouting your bold sea-songs out into the storm."

The butcher insisted upon rowing us to the shore. As we bade him farewell he cordially invited us to pay him a visit whenever we felt like breathing a little sea air.

"When you are fixed and settled," he said, "I want to send you—a—not exactly a present, but something to remind you of this part of the world."

THREE months after this there came to our new home an enormous box, which gave rise to more curiosity in Doris and myself than we had ever felt in regard to any package in any shape or size. When, after an infinite deal of pains, the cover had been forced off and some wrappings removed, there we saw the *Merry Chanter*, unbolted from the bow of our ship, and sent by the butcher to us.

When Doris saw it she burst into tears.

"He shall be our household god," she said. "As long as we live he shall stand in our home."

He stands there now.

Frank R. Stockton.

FROM TOKIO TO NIKKO.

AN ARTIST'S LETTERS FROM JAPAN.

BY JOHN LA FARGE.

WITH PICTURES BY THE AUTHOR.

JULY 20, 1886.—The cholera was upon us, and we decided to go to Nikko and spend a month there, near the F——s'. The doctor, who was anxious to get back to its coolness and its other charms, was to pilot us and instruct us by the way, and much of the miscellaneous information that I shall give you has come more or less from him. Late in the morning we rode to Tokio, and lunched in Uyèno Park, looking down on the great pond and the little temple which stands in it, and which you know, having seen it on the fans and colored prints. They were veiled in the haze of the sunlight, as if in a spring or winter mist, and through this fog of light shone the multitudinous little sparkles of the ribs and swellings of the lotus pads, lapping one over another, and reaching to far streaks of clearer water. A denser lightness here and there marked the places of the flowers, and a faint odor came up in lazy whiffs. The roof of the temple seemed to be supported by the moisture below. Above there was no cloud. All things lay alike in the blaze, enveloped in a white glimmer of heat and wet, and between the branches of the trees around us the sky was veiled in blue. The locusts hissed with a crackling sound like that of heated wood. The ugly bronze Buddha at the corner of the tea-house shone as if melting in the sun. Then came the moment of leaving for the station, where, owing to delays of trains,* we waited still longer in the heat. In the cleanly waiting-room we looked at the illustrations in the Japanese newspapers, and at the last report of the weather bureau, printed in English and fastened to the wall, or read a little in that morning's edition of the excellent Yokohama English paper; all these comforts of civilization being supplied by the road. At length the noise of hundreds of wooden clogs, worn by men, women, and children, clattered upon the stones outside, and announced an end to waiting. The tightly closed train had been baking in the sun all day, and we leaned out of the doors on the sides and gasped for breath.

Our train skirted the great hill of Uyèno, and its dark shadow, which did not quite reach us. Monuments and gravestones, gray

or mossy, blurred here and there the green wall of trees. The doctor told us of the cooler springtime, when the cherry trees of Uyèno cover the ground with a snow of blossoms, and the whole world turns out to enjoy them, as we do the first snows of winter.

But this is a lame comparison. The Japanese sensitiveness to the beauties of the outside world is something much more delicate and complex and contemplative, and at the same time more natural, than ours has ever been. Outside of Arcadia, I know of no other land whose people hang verses on the trees, in honor of their beauty; where families travel far before the dawn to see the first light touch the new buds. Where else do the newspapers announce the spring openings of the blossoms? Where else would be possible the charming absurdity of the story that W—— was telling me of having seen in cherry-blossom time some old gentleman, with capacious saké gourd in hand and big roll of paper in his girdle, seat himself below the blossom showers, and look and drink, and drink and write verses, all by himself, with no gallery to help him? If there is convention in a tradition half obligatory, and if we, Western lovers of the tree, do not quite like the Japanese refinement of growing the cherry merely for its flowers, yet how deliciously upside-down from us, and how charming is the love of nature at the foundation of the custom.

From the rustling of leaves and reëchoing of trees we passed into the open country, and into free air and heat. In the blur of hot air, trembling beneath the sun, lay plantations and rice fields; the latter, vast sheets of water dotted with innumerable spikes of green. Little paths raised above them made a network of irregular geometry. Occasionally a crane spread a shining wing and sank again. In the outside ditches stood up the pink heads of the lotus above the crowded pads. At long intervals small groups of peasants, men and women, dressed in blue and white, knee-deep in the water, bent their backs at the task of weeding. The skirts of their dresses were caught up in their girdles, and their arms were freed from their looped-back sleeves.

The doctor spoke to us of the supposed unhealthiness of rice planting, which makes life in the rice fields short, in a country where life is not long.

THE LAKE IN UVËNO PARK.

We are told that the manuring of the rice fields taints all the waters for great distances, and we are warned not to drink, without inquiring, even from the clearest streams. Not even high up in the mountains shall we be safe; for there may be flat spaces and table-lands of culture which drain into the picturesque wildness below. We learn that with all these hardships the rice growers themselves cannot always afford this staple food of the country, for cheaper than rice are millet, and buckwheat, and the plants and fungi that grow without culture.

Contrasting with the tillage we were passing, islands of close foliage stood up in the dry plain, or were reflected, with the clouds above, in the mirror of the wet rice fields. Occasionally a shrine was visible within, and the obligatory Torii stood at the edge of the grove, or within its first limits.

Looking through a Torii one is sure to be in the direction of something sacred, whether it be temple or shrine or holy mountain. Neither closeness nor distance interferes with this ideal intention, and the sacred Fusi-yama is often seen a hundred miles away in the sky, framed by these lines, built for the pur-

A TORII.

pose. This assemblage of four lines of stone or wood or bronze is to me one of the creations of art, like the obelisk or the pyramid. Most impressive, most original of symbolic entrances, whether derived from sacred India or from the ancestral innocence of Polynesia, there is something of the beginning of man, something invented while he lived with the birds, in this elementary porch, whose upper line, repeating the slope of hill and wave, first embodied the curve that curls all upper edges in the buildings of the farther East.

And if indeed the Torii¹ be nothing but the first bird-perch, then I can imagine the father of all peacocks spreading his gigantic fan across its bars; or I may prefer to suppose it the rest for the disk of the sun god, whose lower curve is repeated by the Torii's upper beam.

SOMETIMES there were traces of inclosure about these woods; sometimes they had no edgings but their own beautifully modeled contours. Long ages, respectful care, sometimes fortunate neglect, have made of these reserved spaces types of an ideal wildness, for these are sacred groves, and they are protected by the divine contained within them.

This preservation of a recall of primeval

¹ The usual etymology of Torii is bird-perch; from *Tori*, a bird.

nature, this exemption of the soil from labor, within anxious and careful tillage, is a note of Japan constantly recurring, and a source of perpetual charm.

Notwithstanding the men and women working in the fields, there was a certain desolateness in the landscape, and A—— made out its reason more easily than I, and recalled that for miles and miles we had traveled without seeing any of the four-footed beasts which the Western mind always associates with pastoral life and labor.

As the evening came on we crossed a large river and looked down from the height of the new bridges upon the discarded ferry-boats, and upon the shape of a more fantastic one that was never meant to sail—a pine tree, shaped and trimmed, spread its green mast and sails in a garden by the water. Far away were lines of mountains and the peaks of extinct volcanoes.

At every station now the country people gathered to stare at the novelty of the train; we saw the lighting up of the farm-houses as we passed; in the door-yards, behind high hedges reminding me of Normandy, bonfires were being made to keep off mosquitoes: then temples and shrines with lights before them, and at eight o'clock on a festal night we came into Utsunomiya.

The streets were full of people carrying lanterns; children ran about together, with little toy shrines, and the whole town was drowned in noise. We got into a *basha*, a sort of omnibus, attached to two wild horses, and were hurled through the crowded streets, much as if carrying the mails, with apparent disregard of the lives and limbs of the inhabitants.

The hotel, where we were expected and where the doctor had represented us as distinguished visitors, opened its whole front, in a Japanese way, to receive us, for there was no outside wall to the lower floor. We were driven quite into the house, and beheld an entire household drawn up in line on the platform, which occupied a full half of this lower space. The doctor did all that was right, while we remained in amused embarrassment before our prostrated host and the kneeling attendants. As we sat helpless on the steps of the platform our shoes were taken off, and in stockinged feet we were ushered through the crowd and the lower part of the house, through the preparations for passing travelers, the smell and heat of washing and cookery, and an inexpressibly outrageous odor, even for this land of frightful smells, evidently of the same nature as that of the rice fields.

Notwithstanding this horror, we found, on clambering up the steep little staircase of dark, slippery wood, better fitted to stockings than to boots, a most charming, cleanly apartment

ready for us: ready, I say, but its three big rooms, which took all one side of the court, contained nothing but a drawing hanging in each room and a vase filled with flowers; in justice, I ought to add a European table of the simplest make, and three European chairs. Under them was spread a piece of that red cloth which seems to have a fascination for the Japanese—perhaps as being European.

Everything was of the cleanest—wall, floor, stairs, tables; everything was dusted, wiped, rubbed, polished.

It was too hot and we were too tired to go out and see the town, noisy with the excitement of a festival. The doctor directed the preparation of a meal on a Japanese basis of rice, mingled and enlivened with the contents of various cans; and meanwhile I went down another little staircase of cleanly white wood, at the farther end of our apartment, to our little private bath-room below.

This was about six feet square, and its furniture consisted of a deep lacquer tray to lay clothes in. The bath-tub was sunk in the floor, but so that its edge rose high above the level of the room. I had declined the "honorable hot water," which is the Japanese necessity, and obtained cold, against protest. I had yet to learn the luxury and real advantage of the Japanese hot bath. I closed my door, but my window was open, and through its wooden bars I could see our opposite neighbors across the garden of the courtyard—a whole family, father, mother, children, and young daughter—file down to the big bath-room at the corner, whose windows were open to mine. I heard them romp and splash, and saw heads and naked arms shining through the steam. Meditating upon the differences which make propriety in various places, I joined my friends at dinner and listened to what the doctor had to say upon the Japanese indifference to nudity; how Japanese morals are not affected by the simplicity of their costumes, and that of course to the artist it seems a great pity that the new ideas should be changing these habits in a race so naturally law-abiding; for even the government is interfering, and enforcing dress within city limits. Then came the question whether this be a reminiscence of Polynesian ancestry and simplicity, or born of climate and cleanliness. And, indeed, all Japan spends most of its time washing, so that the very runners bathe more times a day than our fine ladies. Meanwhile the servant-girls were spreading for us the blue-green mosquito nettings, put together with bands of orange silk. They were slung by cords from the corners of the beams, which serve for a cornice, and made a good-sized square tent in the middle of the room. Inside, our beds

OUR RUNNER.

were made up on the floor, of well-wadded coverlets folded one upon another. One of these I took for a pillow. I have not yet dared to try the block of wood, hollowed out for the nape of the neck, which serves for a pillow in Japan, notwithstanding that it has a pad to relieve its severity — a pad of paper fastened on, and which you remove sheet by sheet as you want a clean pillow-slip. I can understand, however, how precious it must be in a country where the women keep, day and night, undisturbed, those coiffures of marvelous black hair, glistening with camellia oil, the name of which I like better than its perfume. From inside my netting I could see, as I was lying,—for the screens, which made our windows, remained wide open,—through the topmost branches of the trees of the garden, the Japanese family opposite, now ending their evening meal.

Laughter and chatter, clattering of cups, rap of pipes against boxes, a young man came in and bent over one of the women seated upon the floor; the girl repeated some prayer, with clapping hands outstretched; the lights were put out, all but the square “ando,” or floor

night-lantern, and they drew their screens. I fell asleep, to be waked with a start by the watchman, who, every hour, paced through the garden, striking a wooden clapper, and impertinently assured us of the hour.

THIS weary noise marked the intervals of a night of illness, made worse by nightmares of the cholera, from which we were flying. The earliest dawn was made hideous by the unbarring and rolling of the heavy *amados*,¹ the drawing back of the inside screens (*shojis*), and the clattering of clogs over pavement, through other parts of the house. Our Japanese family across the way I could hear at their ablutions, and, later, tumultuously departing for early trains, and at last I slept in broad daylight.

LATE in the morning we entered our friend the basha. In the daylight, I noticed that the horses wore something like a Dutch collar, and were harnessed with ropes.

Two men, one the driver, the other the running groom, sat on the low front seat. Our trunks and bags and Japanese baskets encumbered the omnibus seats on which we stretched our sick and wearied bodies — for the doctor himself was ill, and smiled mechanically when I tortured him with questions. We left town at a full gallop, and at risk of life for every one in the streets; one of our drivers meanwhile blowing wildly through a horn, to the inspiring of the horses and the frightening of the Japanese small boy. Soon one of our men plunged off his seat and began running by the horses in the old Japanese way — hereditary with him, for they follow the calling from generation to generation. Running without pause and without sweating, he threw his body back as if restraining his pace to that of the horses. At the limits of the town, in full run, he stripped his upper garments and showed himself tattooed at every visible point. Above the double strip of his breech-clout, a waterfall, a dragon, and a noble hero made a fine network of blue and pink on the moving muscles.

¹ Rain-doors, outer wooden screens, which close the house at night, and roll in a groove.

Now the road became heavy, wet, and full of deep ruts; and our miserable ponies came to a stand-still—and balked. The Japanese mildness of our driver disappeared. He took to beating their poor backs with a heavy bamboo cane; while we remonstrated feebly, regretting that we had not sufficient strength to

lotus and the iris, the peach, the cherry, and the plum make up the flower poetry of the extreme East.

THEN, leaving the dry and sunny uplands, we entered a famous avenue, shaded for twenty miles by gigantic cryptomeria trees 60 to 120

IN THE GREAT AVENUE OF CRYPTOMERIA.

beat him too. Then he explained, deferentially, that confusion seized him at being unable to keep his promise of delivering us at Imaichi for the appointed hour; and I felt as if we had been put in the wrong. Imagine the difference had he been—any one but a Japanese. We turned aside from the main way into a little dry side-path, which led us into the hills and moors. As we got among them we left the annoying odors of the rice fields, and smelled for the first time the fragrance of wild roses, looking like ours, but a little paler. This was the first thing which reminded me of home—the roses that the Japanese do not seem to care for, do not seem to understand. With them the rose has no records, no associations as with us, for once on this farther side of the garden of Iran, the peony and the chrysanthemum, the

feet high. They were planted, as an act of homage, some two centuries ago, by some mighty noble, when it was decided to place at Nikko the tomb of the great shōgun Iyēyasū. They rise on each side of the sunken road, from banks and mounds, over which steps lead, from time to time, to plantations and rice fields beyond, and to shrines peeping out among the trees. In side-roads above, on either hand, passed occasionally peasants and pack-horses laden with forage, or the bright shine of a peasant woman's red skirt. Where an occasional habitation, or two or three, are niched in some opening, the tall columns of the great trees are interrupted by spaces filled with crossed branches of the wilder pine, and behind these, outside, sometimes the light-green feathery mass of a bamboo grove.

Against the bank stood low thatched buildings; near them, the great trees were often down, or sometimes dying; an occasional haystack, sliced off below by use, was fastened, in thick projection, around some smaller tree. Once, at a turn of the road, near a building with wide roof, pushed against the corner bank out of a basin fringed with iris, sprung into the air a little jet of water. Near by, a solitary ditcher had placed in a bamboo fence some bright red blossom, with its stem and leaves, apparently to cheer him at his work.

The heavy road was being ditched on each side to carry off the soaking waters, and our weary, miserable horses broke down again. A—— and I rested by going in advance, and I experienced the new sensation of walking among the bamboo stems, like an insect among the knotted stalks of a gigantic grass. The still heat of the sun burned in great smoky streaks across our way, spotted by the flight of many yellow butterflies. There was no sound of birds in the high spaces above; the few peasants that we met slipped past on their straw sandals, their noiseless horses also shod with straw; occasionally a shiver of the great spruces overhead, and far behind us the cries of our groomers to their horses.

It was two o'clock when we galloped bravely, as if with fresh horses, into the single long street which is Imaichi village. We were now on high ground, some two thousand feet above our point of departure, and could feel, but not see clearly, in the blaze of sunlight, great mountains lost in great wet clouds.

WE stopped at the village inn; drivers and runners were sitting on the stone bench in front, drinking tea, when we drove up. We sat down on the straw-matted porch inside, the whole front of the building open, and drank miserable, herby tea, and tasted the usual sweet balls of sugary stuff.

Alongside the tea-house, in one of the recesses between the buildings, we could see the runners of *kurumas* being washed off and rubbed down, just as if they were horses in a livery stable. As they stood naked, their companions poured pails of water over them, its brown spread covering the stone slabs. Some of them, in the porch, lay on their backs, others prone, others on the side, all near a kettle, which hung over a charcoal fire, in which, perhaps, they were heating *saké*. One on his back, his neck on the wooden pillow, was smoking. The village itself lay in hot, clean repose,—not dusty,—the rows of buildings on each side of the street irregular, but all of the same appearance. Most of the fronts were open, the goods all displayed outside of the walls, or on the floors; innumerable pieces of paper hanging about every-

where. A few men sat about on the porches, their naked feet hanging off, their sandals on the ground below them, the inevitable umbrella by their side. Most of the village was asleep, in nakedness. The color of flesh glowed in the hot shade; brown and sallow in the men, ruddy on the breasts of the women and the entirely nude bodies of the children.

And here, now, we said good-by to the *basha*, and got into the two-wheeled baby-wagon, which they call a *kuruma*. One man ran between the shafts, and another, in front, was fastened to the cross-bar by a long strip of cloth tied about him. The file of our five wagons started off at a rapid trot—we had two for our baggage—with the doctor ahead, his white helmet dancing before us in the sun. From under my umbrella I tried to study and occasionally to draw the motions of the muscles of our runners, for most of them were naked, except for the complicated strip around the loins—a slight development of the early fig-leaf. The vague recall of the antique that is dear to artists—the distinctly rigid muscles of the legs and thighs, the rippling swellings of the backs—revived the excitement of professional study and seemed a godsend to a painter. The broad, curved hat, lifted by a pad over the head, was but an Eastern variation, not so far removed from the Greek *πέταρος* of Athenian riders. Some heads were bare; that is to say, their thick black thatch was bound with a long handkerchief, which otherwise hung on the shoulders or danced around their necks. Not all were naked. The youngest, a handsome fellow, had his tunic pulled up above the thighs, and the slope of his drapery and his wide sleeves gave him all the elegance of a medieval page. I found it easier now to struggle against heat and indolence, and to make my studies as our runners ran along, for we had entered again the avenue of the great *cryptomeria*. We had passed the entrance of another, which in old times was the road, traveled by the mikado's ambassador, in the fifth month, when he journeyed across the island to carry offerings to Iyéyasu in his tomb at Nikko. The big trees grow still taller in this higher air, their enormous roots spreading along the embankments in great horizontal lines and stages of buttresses. Prolonged wafts of cool air blew upon us from the west, to which we were hurrying. Above us spread a long avenue of shade, high up and pale in the blue. And so we got into Nikko as the sun was setting, with the delicious sensation that at last we were in coolness and in shade.

RIGHT before us, crossing the setting sun, was the island mountain of Nikko-san; small

enough to be taken in by the eye, as it stood framed by greater mountains which were almost lost in the glittering of wet sunlight. The mountain threw its shade on the little village; down its one long street we rode to the bridge that spans the torrent, which, joining another stream, gives Nikko the look of an island. Alongside this bridge, at a distance of two hundred feet, crosses the red lacquer bridge, over which we are not allowed to pass. It is reserved for the family Tokugawa, the former

Before us steps of enormous width passed under the foliage and turned above in many directions, and there on the lowest step, her dainty feet on straw sandals, whose straps divided the toes of the close-fitting Japanese socks, with bare ankles, stood our hostess, in latest European dress, most graceful contrast to our own consciousness of being jaded and dirty, and to the nakedness of our runners. Panting with the last run, they stood at rest, and leaned forward against the cross-bar of the shafts, with mus-

NIKKO-SAN.

shōguns of Japan, whose ancestors built the great shrines of Nikko, and for the emperor on his occasional visits. It stands supported on a gigantic framework of stone, imitating wood, the uprights being pierced to allow the crosspieces to run through, against all European constructional principles, but with a beauty which is Japanese, and a fitness proved by time.

These great posts under the bridge lean against what seems the wall of the mountain; the rock foundation being supplemented, everywhere that a break occurs, by artificial work. Here and there cascades fall over natural and over artificial walls and glisten far up through the trees on the opposite side of the bridge. As we rattled over it, we looked down on the overflowing long wooden trough, which carried the pure waters of the mountain to the village that we had passed, and upon the torrent below, whose limpid clearness was made blue by mist, where the warmer air was chilled by a coldness drawn from far-up mountains.

cles still trembling, clear streams of sweat vanishing their bronze nakedness, and every hair plastered with wet on forehead, chest, and body. Just before them rustled the unrumpled starched spread of the skirts of the fair American. She was summering at Nikko, and, friendly with the Buddhist clergy, had arranged that one of the priests should let us have his house, and kindly walked with us to it, a little way up in one of the first open spaces of the mountain. After passing the great outside fringe of trees we found a large clear opening, broken up by walled inclosures, the wall sometimes high and sometimes low, and edged by gutters through which the torrents ran. These were the former residences of princes, whom etiquette obliged to worship officially at Nikko. A quarter of a mile up we came to our own garden,—with an enormous wide wall or embankment of stone, some twenty feet deep,—which also had been a prince's, and now belongs to the little Buddhist priest who is our

THE WATERFALL IN OUR GARDEN.

landlord. There are two houses in the inclosure, one of which he lets to us. Ours is brand-new and two stories high, while his is old and low, with an enormous roof, and an arbor built out from the eaves and connecting with his little garden. High behind his house rise rocks and wall; and on top of them are planted willows, pines, maples, and the paulonia, whose broad leaves are part of the imperial crest. A little waterfall tumbles over the rocks and gives us water for our garden and for our bath. In our house we made the acquaintance of Kato, who is to wait upon us. A few minutes later

we were welcomed by our landlord, dressed for the occasion. He conducted us to our rooms, and leaving for a moment returned with a china bowl that was covered with a napkin, and contained sweetmeats which he told me are peculiar to Nikko.

Seeing that we were helpless with the language, he bowed low and left us to our bath and to a survey of our new quarters. We were tired, sick, miserable, weary travelers, having gone through a shipwreck of heat and fatigue, but there was a fascination in feeling that this baby-house is ours, that it is typical, that on entering

we left our shoes out on our own threshold and were walking on the soft clean mats, stocking-toed; that in a few minutes we should be stretched on these as on a bed, and that Kato would pour out our tea. Our lowest story, which has a veranda, can be divided so as to make a servant's room and a hall beyond. In an L behind stretches out a wash-room with a big dresser fixed to the wall, under which, through a trough, rolls a torrent from the waterfall; and, farther on, the little square bath-room with one side all open to the floor, when the wooden screen is drawn, through which we get light and air, and through which the box containing burning charcoal is brought from the priest's house to heat our bath. We have a little staircase — just the width of our trunk — which leads sharply up to the veranda above, from which we step into A——'s room and then into mine; they are separated by movable screens, so that we can be about as private as if the division were a chalk line. But outside we have a wealth of moving wall: first the paper screens, which, when we wish, can separate us from the veranda; then, lastly, on its edge, the amado, or

wooden sliding doors, which are lying now in their corner box, but which later will be pulled out and linked together, and close the open house for the night.

Then, as we were about leaving, we solemnly placed a great ornamented revolver before the little god of Contentment who sits upon the Tokonoma — that mantelpiece which is at the level of my eye when I lie on the floor, and which is the Japanese ideal seat of honor, but never occupied. This revolver is left there to appease a Japanese conventional fear of robbers. We went down in the twilight to our friends, and had a very European supper, and sat on their veranda, looking through the trees towards the bridge, in a moonlight of mother-of-pearl; and we were so sleepy that I can only suppose we must have talked of home, and I can only remember our host clapping his hands for lanterns, and Kato leading us back, with the light held low, and the noise of the torrents running under the little stone bridges that we passed, and our taking off our shoes on our own door-step, and the thunder of the amados as Kato rolled them out for the night.

John La Farge.

THE VOICE OF THE VOID.

I WARN, like the one drop of rain
 On your face, ere the storm;
 Or tremble in whispered refrain
 With your blood, beating warm.
 I am the presence that ever
 Baffles your touch's endeavor,—
 Gone like the glimmer of dust
 Dispersed by a gust.
 I am the absence that taunts you,
 The fancy that haunts you;
 The ever unsatisfied guess
 That, questioning emptiness,
 Wins a sigh for reply.
 Nay; nothing am I,
 But the flight of a breath —
 For I am Death!

George Parsons Lathrop.

GLASGOW: A MUNICIPAL STUDY.

THE people of Glasgow are accustomed to claim for their city the second place in the British Empire. If by the words "city," "burgh," or "borough" there is meant merely a populous place,—an aggregation of houses and people with a concentration of various commercial, industrial, and social interests,—then metropolitan London would assuredly rank first and without rival. But if by these words is meant a distinct and complete municipal organism, the people of Glasgow may claim not the second, but the first place among the communities of Great Britain. London as a municipal corporation is but a mile in extent and has only fifty thousand people; "larger London" having no unified corporate existence.¹ Glasgow in 1888 had a population of 560,000 within a compactly inhabited area of 6111 acres; and its vigorous development has caused so generous an overflow that the whole community, including the continuously built-up suburbs, now numbers little short of 800,000 souls. The annexation of 8000 additional acres is about to be accomplished by act of Parliament.

As a type of the modern city with highly developed and vigorous municipal life, and with complex, yet unified, industrial and social activities,—in short, as one of the most characteristic of the great urban communities in the English-speaking world of the nineteenth century,—Glasgow may well repay study. It combines in itself most remarkably all that is significant in the history of city government among peoples of British origin; that is to say, to study Glasgow is to study the progress of municipal institutions in every stage. Like all modern commercial cities Glasgow has exhibited the phenomenon of rapid growth, and has had to meet the various problems that rapid growth under new industrial and social conditions has forced upon the attention of all such cities. Indeed, Glasgow has grown quite as rapidly as the large towns of America. In 1750 the population was less than 25,000. In 1800 it was approximately 75,000. In 1811 it was 100,000; in 1831, 200,000; in 1851, 329,000; and in 1871 it was 478,000. In 1881 it had reached 488,000, with 186,000

more of overflow into the immediate suburbs, making a total of 674,000. And to bring the figures up to 1889, it is reasonably safe to estimate that within a district six or seven miles long and three or four miles wide, containing less than 15,000 acres, there is a population of 775,000.

Whether originally due in greater or less degree to the danger of raids from Highland clans and attacks from invading English armies, it has from a very early period been the custom of Scotch townsfolk to build compactly and to house the population in tenement-flats. Aberdeen, Dundee, and Leith illustrate this custom quite as well as do Edinburgh and Glasgow. The rapid growth of the present century has given most serious reality to all the latent and lurking evils of a tenement-house system, and Glasgow has been compelled to study and apply modern remedies—indeed to be a leader in the invention and trial of remedies—for the ills that spring from the overcrowding of the poor. The regulation of house building and occupancy; provision for domestic cleanliness; schemes of street cleansing, of garbage removal, of epidemic disease prevention, of improved "watching and lighting" arrangements, with a view to the lessening of crime; provision of shelter for floating population; a differentiated and adequate system of sanitary inspection; the establishment of baths and various conveniences to improve the health, comfort, and moral condition of the people: all these features of recent municipal activity may be studied to special advantage in Glasgow.

Like Liverpool in England, or Chicago in America, Glasgow is an excellent instance of what I may call the "self-made," or rather self-located, modern commercial city, as contrasted with great urban communities like London and New York, which have assumed vast proportions and importance in spite of themselves and without the application of any organic municipal energy. Glasgow more than a hundred years ago entered deliberately upon the herculean task of making itself an important port by deepening its shallow river into a harbor and an ocean highway. Following the gradual improvement of the Clyde navigation came first a large American trade, in tobacco, cotton, and other staples. The development of the coal and iron mines of the Clyde valley in the immediate neighborhood followed; and when the day of iron ships had its dawning,

¹ Larger London's new county council may, however, be regarded as the beginning of a central metropolitan government.

Glasgow was prepared to make them for the nations. Meanwhile its textile and chemical manufactures had been growing in importance, and the community found that its courage and energy had resulted in its expansion to the rank of one of the greatest centers of industry and commerce in the entire world.

In all this expansion Glasgow's character as an integral community has been exceptionally well sustained. The people have been disposed to live inside the circle of their work, and that must obviously signify a high degree of centralization; by which I mean something more than mere density of population. The same families send workers to the ship-yards, or iron works, and to the textile factories where women and children are employed. All the great industries belong essentially to the one working community. It is peculiarly interesting to observe a city which, having made itself prosperous and mighty by well-directed, organized municipal energy, at a later time applies that same energy to the solution of the dark social problems which seem the inevitable concomitant of the new material progress of communities.

GENERAL ORGANIZATION.

THE present municipal organization of Glasgow is simple and easily understood in its main features, although somewhat anomalous and complex in certain minor respects. The whole government may be said to be exercised by a grand committee of fifty men chosen by the qualified electors. There are sixteen municipal wards, each of which elects three members of the town council. The election is for a term of three years, and one man from each ward retires annually. There are also two *ex-officio* members of the council, namely, the "Dean of Guild," who represents the venerable Merchants' House, and the "Deacon-Convener," or chairman of the associated trade guilds; these two functionaries representing the bodies which before the Scotch Municipal Reform Act of 1833 were in sole control of the municipal government. The perpetuation of this custom of allowing a small share in municipal government to the old-time trades' and crafts' corporations is not practically objectionable, and it unites the present with the past in a manner peculiarly British.

The municipal franchise before 1868 was, like the borough parliamentary franchise, in the hands only of rate-payers upon premises valued at £10 or more, and who, whether occupiers or owners, lived within seven miles of the borough. In 1868 the franchise was further extended to all occupiers of houses within the borough, however small their rent,

provided they paid their poor-rates. This is known as the household franchise, and comes short of universal suffrage only in excluding lodgers. There is a special lodgers' franchise for those occupying rooms worth £10 a year, unfurnished, but unmarried workingmen are practically excluded. For the entire city of Glasgow there are only about a thousand names registered upon the lodgers' list. The municipal franchise now differs from the parliamentary only in the particular that women householders are admitted to the one and excluded from the other. The present number of men entitled to vote is 75,000 and of women 14,750—a total municipal electorate of 89,750.

In considering the effect of the franchise upon city government, it is to be borne in mind that not only is the mass of unmarried workingmen excluded, but also all others who have failed to pay their rates. This is a point of enormous importance; for I have ascertained that in Glasgow last year no less than 25,000 householders were disfranchised by reason of non-payment of assessments. The total number of houses is 121,722, of which number 86,089 are valued at less than £10 a year. It is estimated that nearly 5000 persons who are registered as Glasgow voters, by reason of ownership or occupancy of premises, live outside the corporation, within the seven-mile limit. The difference between the actual voting registration—which is made by the assessor and is complete—and the number of houses exceeds 30,000; and after making due allowance for unoccupied premises and other considerations, the fact remains that about one-third of the householders enfranchised by the act of 1868 fail to pay the rates and never vote. If it were possible to secure reinstatement by payments of arrears, as an election approaches, there would be a tempting field of activity opened up to corrupt politicians. But this cannot be done. The better class of workingmen in Glasgow of course pay their rates, take an active interest in public affairs, and do not fail to vote. But there is a very large population of the degraded poor which does not in fact participate in elections, and is not of the slightest service to "ward politicians"; a genus which, by the way, is rarely found in British cities. What I may call the self-disfranchisement of the slums is an important consideration in Glasgow's municipal government.

The councilors of Glasgow come chiefly from the ranks of men of business, and are upright, respected, and successful citizens. No salaries attach to such offices anywhere in the United Kingdom, and it is deemed an honor to be selected to represent one's ward. Party lines are seldom very sharply drawn in municipal elections. An efficient councilor may, in

general, expect reelection for several terms if he is willing to serve. The seat of a satisfactory man who asks reelection is in a majority of cases not contested at all. No other candidate will appear, and he will be awarded the seat without the actual holding of an election. It may be said that in the sixteen wards of Glasgow it is unusual to have more than five or six contests for seats in any one year.

From their own number the councilors choose a "provost," usually called the "Lord Provost," and ten "bailies" or magistrates. The provost in Scotch towns corresponds to the mayor in English towns, while the bailies are in some respects analogous to the English aldermen. The provost presides over the council, serves on council committees, and personifies the pomp and dignity of the municipality; but except in his capacity as a member of the council he has no important executive responsibility. He has no appointments to make and has no veto upon enactments of the council. Like the bailies, he is, however, a magistrate, and has his share of judicial work to do, mostly in the exercise of ordinary police jurisdiction. The bailies sit as citizen magistrates in certain districts of the city upon a plan of rotation, each being assisted by a paid legal adviser technically called an "assessor." To relieve them somewhat, there is now employed a "stipendiary," or salaried police judge, who sits constantly in the central district. The provost and bailies are designated for three years. It is important to make clear to American readers that the provost is in no sense an administrative head as the American mayors are, and that there is not in British cities any disposition whatever to concentrate appointing power and executive control in the hands of one man as an effective way to secure responsible administration. There is nothing in British organization or experience to sustain the proposition of certain American municipal reformers that good city government can be secured only by making the mayor a dictator. American conditions differ considerably, however, from English conditions; and the success of administration by town councils in Great Britain is not a conclusive argument against the theories of the American reformers.

All appointments, as I have said, are made by the council itself. Heads of departments are selected with great care and their places are practically permanent. In the minor appointments the responsible heads are allowed to use large liberty of suggestion, the council ratifying such selections as are agreed upon by the departmental head and the supervising council committee. Although the number of persons in the employ of the Glasgow departments is large, there is no examination system

in use. The best men are selected from among the applicants, and there is little or no complaint of favoritism. Those conditions under which an examination system might be very desirable happily do not exist.

While the full government of the city is vested in the fifty members of town council constituting a body officially known as "the lord provost, magistrates, and council," they exercise their powers under various acts of Parliament which make them (1) water commissioners, (2) gas trustees, (3) market and slaughter-house commissioners, (4) parks and galleries trustees, (5) city improvement trustees, and (6) a board of police commissioners. These distinctions are chiefly matters of book-keeping. The essential fact is that the powers are all vested in the common council. Each of these departments is organized separately, and its work is carried on under the supervision of a standing committee of the council.

The town clerk is the most important standing officer of all British towns. He is expected to hold his position for life. He is much more than simply the keeper of the records of the council and its committees. He attends its meetings also as its constant legal adviser. He drafts measures desired from Parliament, and takes charge of them while pending. He is the city's conveyancer, the custodian of its title-deeds and charters, and its attorney in all civil actions. The Glasgow clerk, James D. Marwick, LL.D., is a high authority upon questions of municipal history and law.

The chamberlain, whose office, like that of the town clerk, is very ancient, is the treasurer of the corporation proper; and the present incumbent has been appointed as the treasurer of several of the newer departments or "trusts." He has also, in Glasgow, gradually assumed the function of a compiler of municipal statistics. He joins the provost and town clerk in arranging for special occasions and "doing the honors" of the city to distinguished guests. The nominal treasurer of the city is a member of the council; but the chamberlain is actual custodian of the funds, while the cashier is still a different official.

The assessor has devolving upon him the important work of valuing "lands and heritages" from year to year for rating purposes, and also that of making the registration lists of parliamentary and municipal voters. Of other officials enough will be said in the descriptions of the working departments.

THE SANITARY DEPARTMENT.

CONSIDERATIONS of the public health have been predominant in determining the most important lines of action entered upon within the

last quarter-century by municipal Glasgow. I shall find it convenient, therefore, to begin an account of the several departments with a sketch of the organization and work of the sanitary administration. These new municipal undertakings find their true center in the bureau of the medical officer of health, who furnishes the vital statistics — and the deductions from those statistics — which incite and direct municipal activity, and who gives constant advice and authoritative judgment as to general methods and particular cases. A council committee of eighteen supervises the entire sanitary administration of the city, with sub-committees on cleansing and on hospitals. The sanitary department is a model of good work and thorough organization. Its ultimate authority is the medical officer of health, while its executive head is the sanitary inspector. The department is in some sense double-headed; yet there is no conflict of authority, and the arrangement works admirably in practice. The medical officer is relieved from the details of administrative work. His office-room adjoins that of the sanitary inspector, and the two officials are in constant communication. The entire force of inspectors is at the service of the medical officer, yet he has no responsibility for their routine work.

The department was established in 1870 upon a broad and wise basis. It was at that time proposed by the new incumbent of the office of sanitary inspector: (1) that the city should be divided into five main districts for sanitary purposes; (2) that a sub-inspector should be appointed for each main district, having under him ordinary or "nuisance" inspectors, epidemic inspectors, a lodging-house inspector, and a lady visitor; and (3) that a central office should be established, with the necessary clerks. This plan was accepted by the council and went at once into operation. The population at that time was 450,000, and the average inhabitancy of the main districts was therefore 90,000. The work began with an out-of-door force of forty inspectors, of whom five were the district chiefs, five inspected lodging-houses, seven were occupied with the detection of infectious disease, eighteen were "nuisance" men, searching for ordinary unsanitary conditions in and about the houses of their districts, and five were "women house-to-house visitors." In essential features the organization is retained unaltered. There remain the five main districts in which sanitary inspection is carried on, although their boundary lines have been altered in order to make each one of them precisely inclusive of a certain number of the twenty-four areas into which, for purposes of vital statistics, the medical officer has divided the city. There are now employed eight epidemic in-

spectors, sixteen nuisance inspectors, and six female inspectors under the immediate supervision of five district inspectors. In addition to these there are six night inspectors, two food inspectors, a common lodging-house inspector, and a vaccinator. The sanitary wash-house and the fumigating staff, although a part of the health force, may be left for a separate description. There is also an indoor force of about twelve thoroughly competent men. All these officials are subject to the orders of the medical officer and the sanitary inspector, and are actively generated by the latter, who holds conferences every morning with the district chiefs and the individual inspectors of all the other branches of the service.

It must be remembered that the prime necessity for all this vigilance grows out of the density of population, which is not equaled by that of any other British city except Liverpool. The present city bounds contain an area of 6111 acres and a population of decidedly more than half a million. The density of London, according to the census of 1881, was 51 to the acre, while that of Glasgow was 84. The average density of sixteen of the twenty-four sanitary districts, moreover, is above 200, and the average density of five districts is 300. Localities are not few where single acres contain a thousand or more people. The tenement-house is almost universal. The best as well as the worst of the laboring class, and the large majority of the middle class, live in the "flats" of stone buildings three or four stories high. In some cases two or three hundred people use a common staircase, and much greater numbers may be found using common passage-ways, or "closes," as they are called in Scotland. For no other English-speaking city, so far as I am aware, are the statistics of house room and inhabitancy so complete as for Glasgow. To quote Dr. Russell, the distinguished medical officer of the city, "25 (24.7) per cent. [of the inhabitants of Glasgow] live in houses of one apartment; 45 (44.7) per cent. in houses of two apartments; 16 per cent. in houses of three apartments; 6 per cent. (6.1) in houses of four apartments; and only 8 per cent. in houses of five apartments and upwards." This simply means that 126,000 of the people of Glasgow live in single-room tenements and 228,000 in two-room tenements. (In Scotland, however, the word "tenement" is usually applied to the entire building, and the word "house" to the one or more apartments arranged for the occupancy of a family; thus the ordinary "tenement" contains many "houses.") These population figures are those of 1881, and Glasgow has grown in numbers materially since that date; so that the number of people living in houses of one or two rooms is actually greater,

although probably a little less relatively. A population thus housed might well give employment to an army of sanitary inspectors. Glasgow's extraordinary rapidity of growth filled the tenements with Irish and Highland laborers from the huts of the rural districts, where they had known nothing of the relations of cleanliness to health, and where, moreover, their unsanitary modes of life were not a menace to thousands of other people. Their uncleanliness in the great city of Glasgow tempts epidemics and keeps the death-rate terribly high.

Among these overcrowded tenements the epidemic inspectors are constantly at work ferreting out cases of contagious disease. Last year they discovered 3769. As yet the law does not make it obligatory upon medical practitioners in Scotland to report cases of such disease, but their voluntary coöperation with the Glasgow department is quite general, and 5230 cases were reported at the office in 1887, making a total of 9000 cases registered. The epidemic inspectors are trained men who have usually served in the higher ranks of the police force. The nuisance inspectors are practical men who understand plumbing and the building trades, and who reported last year 21,886 "nuisances," practically all of which were in consequence remedied. These had to do with defective drains, matters of water-supply, garbage accumulations, offensive ash-pits, and all sorts of structural defects, decays, and unwholesome conditions.

The work of the night inspectors is done under the authority of a clause in the Glasgow police act which provides for the measurement of all houses and the ticketing of those which have less than 2000 cubic feet of space. The tickets posted on the doors show the maximum number who may occupy the house, and the night inspection is to prevent overcrowding. For, small as these abodes are, great numbers of them take lodgers in addition to the regular family. Fourteen per cent. of the one-room houses and 27 per cent. of the two-room houses take lodgers. In a recent public address, entitled "Life in One Room," Dr. Russell, the medical officer, remarked, "Nor must I permit you in noting down the tame average of fully three inmates in each of these one-apartment houses to remain ignorant of the fact that there are thousands of these houses which contain five, six, and seven inmates, and hundreds which are inhabited by from eight even to thirteen." The last report of the department shows 16,413 ticketed one-room houses, and 6617 ticketed two-room houses; and the total number of inspections made last year (1887) for overcrowding was 52,996. Of these one-room houses, 3285 contain less than

900 cubic feet of space. The average rent of one-room houses throughout Glasgow is almost exactly \$2.00 per month, while that of two-room houses is about \$2.60. The average cubical space of the two-room houses as compared with that of the single apartments is somewhat greater than the relative excess of rent. The inspection of these houses is of immense public benefit; but the undeviating enforcement, by the use of pains and penalties, of the rules regulating overcrowding, is obviously impossible. The inspectors and the police magistrates are obliged to use discrimination, and to deal leniently in one case and severely in another.

It is the business of the common lodging-house inspector to secure the registration of all establishments of the sort everywhere known as lodging-houses, to visit them frequently, and to enforce public regulations which have wholly transformed these places in Glasgow. There are one hundred and one of them now on the inspector's list. But I shall have occasion on a later page to refer again to lodging-houses.

The work of "female visitation," as it is called, among the poor families is doubtless productive of great good. The lady inspectors made more than 45,000 visits last year, and their suggestions as to cleanliness and household reform seem to carry weight by virtue of their official position. It is hardly necessary to say that in the selection of ladies for this work care is taken to obtain the services of those who have tact, discretion, and sympathy.

EPIDEMIC HOSPITALS.

BUT I must pass on to a description of the means used by Glasgow for the isolation and treatment of infectious disease. For the health authorities long ago discovered, what some American cities seem so slow to learn, that epidemics are not inevitable visitations, but are preventable. Glasgow had suffered from typhus and small-pox and cholera and other plagues from time to time, and had depended upon the parochial authorities and the privately managed hospitals to make special provisions at such times for the epidemic cases. At length, in that series of health acts passed by Parliament, some for Scotland as a whole, and some for the local authorities of Glasgow, which began about 1855 and which is yet far from ideally complete, it was provided that the Privy Council might, by order, in special emergencies, confer upon the local authorities temporary powers for dealing with epidemics after their acknowledged outbreak; these powers including the right to provide "such medical aid and such accommodation as might be required." Serious prevalence of typhus in

1864 compelled the health officer to look to the authorities for accommodation; and a temporary pavilion hospital was accordingly opened. Its usefulness was so great that when, in 1866, the Glasgow police act was revised, a new clause compelled the local authorities to maintain the existing hospital and empowered them to open others for the reception of infectious cases and the protection of the public against epidemics. In 1869 typhus compelled the enlargement of the original hospital to 250 beds, and in the next year "relapsing" fever not only filled these quarters with patients, but forced the authorities to make additional provisions.

They acted with a most commendable wisdom. On the extreme eastern edge of the city was a private estate, called Belvidere, containing rather more than 30 acres, and sloping beautifully down to the Clyde. It was purchased, and the mansion-house was enlarged and transformed into quarters for the attendant physicians and nurses. Wards were hastily built of wood in the detached pavilion form. These have gradually been replaced by permanent pavilions of brick and stone, each containing two wards. The establishment is now the most attractive and complete in its appointments and in adaptation to its particular purposes, and the most satisfactorily administered, of any in the United Kingdom, if not in the world. As now used it has accommodations for from 500 to 600 patients, which can be increased to 1000 without any overcrowding of the spacious wards. A technical description of the arrangements of this establishment is not, however, compatible with the scope of my paper, and I must not digress in that direction. Thoroughly compatible, however, is a discussion of the policy of the Glasgow authorities in giving this place the semblance of a lovely village, with its trees and lawns, its playgrounds and beautiful flower-gardens, with its separate and home-like private apartments instead of common dormitories for the eighty nurses, and with convalescing-rooms and every convenience attached to each sick-ward — when it would have cost much less money to build a big, repulsive "pest-house" and inclose it with a grim wall, "a place for sick paupers to die."

I am not dealing with sentimental considerations when I commend this policy. The difference between popularity and unpopularity in a public hospital for infectious diseases may well mean all the difference between a terrible epidemic and its easy prevention. What, for instance, is the extra cost of a spacious and attractive hospital where it is actually a privilege for a poor child to be sick, compared with the frightful cost, direct and

indirect, entailed upon a city by the prejudices which so frequently lead to the secretion of epidemic patients by the ignorant poor? In a densely populated city everything depends upon the discovery and isolation of such forms of disease at the earliest possible moment. An epidemic destroys valuable lives, and it also paralyzes trade and industry and causes immense pecuniary loss. It is the endeavor of Glasgow to treat contagious cases with such care and tenderness and such affluence of all that modern invention and science can suggest, as to secure ready coöperation from all classes in the work of isolating infection. The plan is growingly successful. After the average sojourn of six weeks at Belvidere patients are reluctant to leave, and they carry wonderful tales back to the tenement-rows. The Belvidere nurses are ladies, and the city gives them such accommodations as, in their arduous and necessarily secluded work, they might reasonably desire. The small-pox wards are built separately, and in fact the small-pox hospital is entirely distinct in all its departments; but when, as at present, there are no small-pox patients, some of the wards are used for scarlet fever, measles, or other diseases, and the whole group of buildings is administered as one great fever hospital. It should be said that the rich as well as the poor may, and do, avail themselves freely of the privileges of this hospital, especially for scarlet fever and measles. The average daily number of patients in 1887 was 332, and the total number received in the year was about 3000. The city's capital outlay in epidemic hospitals is half a million dollars. Dr. Allan, the accomplished medical superintendent, agrees with Dr. Russell, the health officer, in regarding the establishments at Belvidere as large enough for the highest efficiency; and when the extension of the municipal bounds is accomplished — a thing most urgently desirable for sanitary administration — it will be the city's policy to develop another hospital at the opposite end of the town.

SANITARY WASH-HOUSE.

NOT the least important feature of the health department's work in Glasgow is the Sanitary Wash-house. A similar establishment should be a part of the municipal economy of every large town. In 1864 the authorities found it necessary to superintend the disinfection of dwellings, and a small temporary wash-house was opened, with a few tubs for the cleansing of apparel, etc., removed from infected houses. For a time after the acquisition of Belvidere a part of the laundry of the hospital was used for the purpose of a general sanitary wash-house. But larger quarters being needed, a

separate establishment was built and opened in 1883, its cost being about \$50,000. This place is so admirable in its system and its mechanical appointments that I am again tempted to digress with a technical description. The place is in constant communication with sanitary headquarters, and its collecting wagons are on the road early every morning. The larger part of the articles removed for disinfection and cleansing must be returned on the same day, to meet the necessities of poor families. I visited the house on a day when 1800 pieces, from 25 different families, had come in. In 1887, 6700 washings, aggregating 380,000 pieces, were done. The quantity, of course, varies from year to year with the amount of infectious disease in the city. The establishment has a crematory, to which all household articles whatsoever that are to be burned after a case of infectious disease must be brought by the vans of the sanitary department. The carpet-cleaning machinery and the arrangements for disinfection by steam, by chemicals, and by boiling I cannot here describe.

The department's disinfecting and white-washing staff is operated from the wash-house as headquarters. A patient being removed to the hospital, the authorities at once take possession of the house for cleansing and disinfection. It is a point of interest also that the city has provided a comfortable "house of reception" of some ten rooms, with two or three permanent servants, where families may be entertained for a day or more as the city's guests if it is desirable to remove them from their homes during the progress of the disinfecting and clothes-washing operations. The house is kept in constant use, and it is found a very convenient thing for the department to have at its disposal.

As net results of the sanitary work of the Glasgow authorities may be mentioned the almost entire extinction of some of the worst forms of contagious disease, and a mastery of the situation which leaves comparatively little fear of widespread epidemics in the future, in spite of the fact that Glasgow is a great seaport, has an unfavorable climate, and has an extraordinarily dense and badly housed working population. The steady decline of the total death-rate, and its remarkably rapid decline as regards those diseases at which sanitary science more especially aims its weapons, are achievements which are a proper source of gratification to the town council and the officers of the health department.

THE CLEANSING DEPARTMENT.

IN close affiliation with the sanitary department, and under the superintendence of the

same general committee of the common council, is the cleansing department. While for administrative purposes it is a distinct service, it seems to me important to make conspicuous the fact that the street-sweeping, garbage-disposal, street-watering, and other work of this important public department are a part of the sanitary government. Health considerations come first. It is the business of the superintendent of cleansing not merely to manage his department to the greatest possible economic advantage, but to manage it primarily in such a way as to satisfy a fastidious medical officer of health. Mr. John Young, for a number of years at the head of this department, has made it a model of efficiency. To use Mr. Young's own language, the work of the department "embraces (1) the scavenging of all courts and back yards forming a common access to lands and heritages separately occupied; (2) the scavenging and watering of all the streets and roads within the city; and (3) the collection, removal, and disposal of all night-soil, general domestic refuse, and detritus."

The propriety of cleansing private courts and passage-ways at public expense is better considered in the practical than in the theoretical aspects. Glasgow has a population of which more than 90 per cent. live in closely built "flatted" houses, and of which 70 per cent. live in houses of one or two rooms. Health demands that the common courts and stairs be kept clean. Experience shows that, if done properly, the owners would pay their private employees more than the small tax—one penny in the pound sterling of rental value—which is collected of them as a special rating for this purpose. There are 11,000 of these courts, etc. to be kept clean, some of which have to be cleansed two or even three times in a day, and all at least once a day. For this work the main cleansing districts are subdivided into sections, which are laid off into about 200 beats, each of which is cleansed by one man under the supervision of a section foreman.

The streets (181 miles) are swept nightly, most of the work being done by twenty-three horse machines which are followed by the department's removal carts. A good feature of this work are the iron boxes or bins, with hinged lids, sunk in the sidewalks next the curbing along the principal streets at intervals of forty yards. Men and boys are kept busy brushing up the day litter and depositing it in the boxes, the contents of which are removed by night with the sweepings.

The summer street sprinkling is also done by the cleansing department, and it is done with great economy, for the simple reason that the amount of the street cleansing work varies inversely to the amount of street sprinkling

required; and so the regular force of men and horses employed to keep the streets clean during the rest of the year is sufficient to do that work and the watering besides in the summer months. The sidewalks of Glasgow are left to be swept by owners and occupants, who are, of course, required to keep them clean. The system as a whole results in well-cleansed thoroughfares.

The third distinct portion of the work of the cleansing department is the collection and disposal of domestic refuse and night-soil; and this is more difficult and expensive than the other two portions combined. For this service the city is divided into several main districts, regard being had in this division to the points of outlet. The central or "business" part of the city is served by daily morning "dust-carts," each house being provided with a special form of covered bucket which facilitates collection. As regards the great bulk of the population, living in flatted tenement-houses, it has been found best to collect refuse, including such excrementitious matter as is not carried down the sewers, from improved "ash-bins" in the back courts. Each main district has a force of men engaged in emptying these bins and wheeling the contents out to meet the night-carts which ply between the district and the nearest "despatch station" of the department. It should be explained that each district is subdivided for this work into six sections, one section being cleansed every night, and the entire city being thus served once a week. As the use of the water-closet system is becoming more general, the amount of excrementitious matter to be collected by the department decreases. But many large factories, besides the numerous "public conveniences" on the streets, make use of the "pail-closet" system, the pails being very frequently exchanged and the removal to the despatch stations being in covered vans. This system of scavenging is as thorough in execution as it is methodical and complete in its plan.

There are two principal and three minor despatch stations. The most approved in its appointments is the one known as the "Crawford Street Works." Stated briefly, it is the policy of the department to send out as manure to the farms just as large a proportion, in bulk and weight, of the street sweepings and general refuse as can be made a marketable article. At Crawford street the carts drive across a weighing platform to a great dumping and sorting floor. Street sweepings, after a little raking to remove newspapers and large articles, are shoveled through hatchways, without further treatment, into railway wagons standing on the lowest floor. The contents of the ash-

bins or separating machines. The larger cinders are sorted out and furnish fuel for the establishment's boilers. The finer ashes and cinders pass down to the floor below into the mixing machines, where they are met by the discharges from the tanks holding excrementa. The newspapers, old baskets, boots, bricks, broken furniture, etc. pass from the riddles to a sorting floor and thence down flumes to the crematory furnaces, where they burn furiously without the aid of any other fuel, a chimney two hundred and forty feet high making a strong air draught. The expense of a much closer cremation and of the drying and condensation of manure, which is necessary in the large English towns from lack of a market for bulky fertilizers, is avoided in Glasgow. The heavy, cold Scotch soil is improved by a coarse and ashy manure that could not be used in the Midland counties of England. The sweepings of the macadamized roads, which are not salable, are used by the city, on its own bog-redeemed farm of "Fulwood Moss," for filling, "top dressing," etc. The total quantity of material carted by the department last year was in excess of 231,000 tons, and the amount of manure sold was 195,000 tons; the difference being made up of snow, drainage of water from muddy sweepings, materials cremated, and macadam sweepings. This is a remarkable record. The manure is sold in fifteen counties, much of it going sixty or seventy miles. The city owns its railway wagons (seven hundred of them), and has an arrangement with all the roads by which the manure is carried for one halfpenny (one cent) per ton per mile, cars returned free. It would be for the obvious advantage of the city to send out the largest possible quantity even if nothing more than freight charges were received. The net proceeds are, however, from twenty-five to fifty cents a ton.

The operations of this department are a charge upon the general police rate (excepting the cleansing of private courts, which is paid for by the proprietors benefited by means of a special levy of one penny per pound of rental value). There were employed, on the average, throughout last year, 794 men—422 in domestic scavenging, 217 in private street and court cleaning, and 155 in public street scavenging and sprinkling. The city has invested nearly \$600,000 in works and plant, and a little further outlay will suffice for the enlarged area and population when annexation is accomplished. The total ordinary expenditure of the department last year, including interest, was \$370,000. Sales of manure brought in a revenue of \$130,000, and after deducting the cost of the private court scavenging met by special assessment, there remained only \$190,000 of general charge to be paid out of the rates for

an admirable and complete service of street-cleansing and watering and of domestic scavenging for a population of nearly 600,000—a net cost *per capita* of only about thirty-five cents. And this economy is the more noteworthy from the fact that the ruling motive of the department is that of the health officer and sanitary engineer rather than that of the contractor. I am tempted to go into some details of the method used by Superintendent Young in buying supplies (horse feed, etc.) for his large operations, but other departments must have their due space.

THE IMPROVEMENT TRUST.

SHORTLY after the extension of Glasgow's boundaries in 1846, and the consequent reorganization of the municipal government, public attention was forcibly drawn to the frightfully crowded and unsanitary condition of the central parts of the city. The success which had followed the city's brave efforts to enlarge and deepen the tiny Clyde into a great ocean highway had been attended with a most extraordinary development of industries in the Clyde valley, and growth of urban population. The more fortunate classes moved out of their old homes in the central district of the city to the handsome West End suburbs. The business core shifted somewhat also, and the old buildings were packed with an operative class which Glasgow's new prosperity had drawn by scores of thousands from the Highlands and from Ireland. The people lived for the most part in single-room apartments, and in unwholesome conditions which will not be readily comprehended by future generations. Epidemics, originating in these filthy and overcrowded quarters, invaded the homes of the better classes, and self-protection made some measures of reform a necessity. It was resolved by the town council to set aside \$150,000 for the acquisition of property in some of the worst neighborhoods; but while a considerable investment was made in condemned tenement structures, the work of building others on the same bad models was going on apace. At length a committee was appointed to make inquiry and report to the council upon the sanitary laws and arrangements of the large cities and towns of the kingdom. Mr. John Carrick, who was a member of that committee, and is now the efficient city architect and master of public works, after nearly half a century of inestimably valuable service in the municipal government of Glasgow, is the principal source of my information upon this subject. The report was made in 1859. It observes:

Originally the "closes" and lanes of the city were not at all objectionable. The houses were of
VOL. XXXIX.—100.

moderate height, and unbuilt spaces were attached to many of the dwellings, and promoted ventilation; now, however, in those localities almost every spare inch of ground has been built upon, until room cannot be found to lay down an ash-pit. Houses, too, which were only intended to accommodate single families have been increased in height and are found tenanted by separate families in every apartment, until they appear to teem with inhabitants. . . . A worse state was disclosed by an inspection of some of the more recently erected houses for the working classes. Tenements of great height are ranged on either side of narrow lanes with no back-yard space, and are divided from top to bottom into numberless small dwellings all crowded with occupants. . . . Occupation of cellars and sunk flats as dwelling-houses is largely in the increase.

These quotations will show the nature of the evil. As remedial measures the committee advised that new police powers be obtained from Parliament to deal with the height of buildings, the size of apartments, the area and back-yard spaces, the lighting and ventilation, the provision of water-closet and ash-pit accommodations, and ample water-supply, and so on. It was further advised that the new legislation for Glasgow should increase the powers conferred on local authorities by the general nuisance removal act (Scotland) of 1856, and that specific authority should be obtained for the appointment of a competent medical officer and staff of nuisance inspectors; for the prevention of overcrowding apartments by regulating the maximum number of inmates on the basis of their air space; for the prevention of the use of sunk floors as dwellings; for compelling owners to cleanse and whitewash house property; and to prevent the discharge of refuse from certain factories and works into the common drains. It was still further recommended that all ashes and night-soil be made the property of the city, and that all proceedings under the new police act be taken summarily before the city magistrates. Special suggestions were added, to the effect that powers be obtained from Parliament to acquire property for the sake of sanitary improvement, upon payment to the proprietors of sums to be fixed in the last resort by competent tribunals, and that public baths and wash-houses be built and opened for the benefit of the working classes.

I have enumerated these propositions at some length because at that time, almost thirty years ago, they were so novel and so far in advance of prevailing notions. With great difficulty the desired legislation was secured, in 1862, for the brief and experimental term of five years. To shorten the story, let it be said that in 1866 the "Glasgow police act" was renewed, with amendments, and made permanent; and under its wise provisions have been developed those

admirable sanitary and cleansing services which I have already described. But in 1866 those parts of the earlier act which related to the purchase and improvement of property were made parts of another famous enactment of the same year, by which the town council was constituted an "Improvement Trust" for the carrying out of certain definite objects specified in the act. It had become constantly more apparent that drastic measures must be taken with the old part of the city. Nothing short of very extensive demolitions could remedy the evil. There were practically no streets at all; but only a system of "wynds, vennels, and closes," permeating an almost solid mass of tenement-houses.

Other large British towns have followed the example set by Glasgow; and demolition, street-widening, and improved construction under public auspices is no longer a novelty. But Glasgow, it should be remembered, had the courage to lead the way; and the Glasgow city improvements act furnished Lord Cross with the model upon which his improved dwellings act was constructed. Glasgow's action was hastened by the fact that several railway companies were seeking access to the heart of the city for great terminal grounds and buildings, and the time seemed especially opportune for a rearrangement and improvement of streets. As laid before Parliament, in 1865, the scheme covered an area of 88 acres, which then contained a population of 51,294; the average mortality of the area for some years past being 38.64, with epidemic diseases the cause of 36 per cent. of the deaths. The average density was nearly 600 to the acre, and in various parts of the district it exceeded 1000—the total inhabitancy of the city then being 423,723, covering an area of 5063 acres, and showing therefore an average density of 83 as contrasted with 583 in the area to be dealt with. The financial side of the scheme looked plausible. The initial outlay was estimated at about \$7,250,000, and it was expected that the re-sale of building-sites would pay back all but \$750,000. A new park was to be made at a cost of \$200,000, and the paving and sewerage of three or four miles of new-made streets was estimated at \$325,000. For all the advantages of improved streets, improved health, and improved general appearance of the town the rate-payers were not to be charged at all really.

The council committee which carried out the improvements acquired some further powers and did more than was originally contemplated. Besides purchasing the 88 acres and some other small areas in the crowded parts of the city, they acquired and laid out in streets and squares for workingmen's residences two

estates known as "Overnewton" and "Oatlands." They also formed an important open space, the "Cathedral Square," in a densely populated neighborhood, and carried out other large enterprises not at first in the list. Their operations were very vigorous from 1869 to 1876, and were coincident with, if not directly the cause of, much house-building and real-estate speculation in Glasgow. A considerable amount of the property acquired by the trustees was disposed of on good terms; but there came a general reaction,—due in part to idle ship-yards,—a marked decline in the price of land, and a cessation of sales. For the past decade the improvement trust has been obliged to hold a large amount of property, at a reduced valuation. The total cost of all its purchases and improvements, not including interest charges, has been about \$10,000,000. For lands sold there has been received approximately \$5,000,000; and the property still held by the trust is valued, at present reduced prices, at nearly \$3,400,000. The margin of shrinkage has, however, been practically covered by current taxation, so that the account now stands about even; *i. e.*, the assets and liabilities of the trust are at a balance. The act authorized an annual assessment of sixpence in the pound of rental valuation, but the trustees have steadily reduced the levy until it is now only a penny.

The principal improvement made is a system of modern streets in the center of the city that will be of advantage for centuries and will repay the cost hundreds of times over. Twenty-seven new streets have been formed and 24 old ones greatly widened and improved. The old unsanitary tenement property has not all been demolished. The plan was adopted of tearing out intermediate buildings, opening back courts, where none existed, and otherwise ameliorating such property as the new streets, and the wide swaths cut by the elevated tracks of the invading railways, left still inhabited. In fact the business depression which checked operations and discouraged and alarmed all Glasgow for the time being made the city improvement trust unpopular and obliged the council to proceed cautiously. The city is, therefore, to-day a landlord on a large scale, and is holding really unsanitary property for the sake of the rents, waiting for an opportunity to sell the sites before demolishing the buildings. Its rents now bring in annually about \$100,000, which sum goes far towards offsetting the interest charge on the property held for sale. The improvement trust has given the city, among other things, the handsome new Alexandra Park.

It remains for me to speak of the model tenements and of the important series of model

lodging-houses which this department has ventured to erect and maintain.

MODEL TENEMENTS AND LODGING-HOUSES.

IT was the original understanding that the city's work was to be that of demolition, and that private enterprise, regulated by the new sanitary rules and requirements, would suffice for proper reconstruction and would make due provision for the displaced population. Rather early in their operations, however, the committee found it advantageous to build one or two tenement-houses as a model and example of proper arrangements and construction; and it may be assumed that a good influence was thus exerted upon the character of the large amount of new house room that builders were at that time providing. These were, however, only incidental undertakings. Very recently the council committee has gone into improved tenement building on a larger scale, and, as it seems to me, with more doubtful propriety. On Saltmarket street, in a very central locality and on the site of old tenement-houses which have been removed, the improvements committee have just expended \$50,000 in building a row of solid tenement-houses, with a dozen shop rooms on the ground floor; and the row is to be at once extended to at least twice its present length. The twofold object is avowed of bringing back population to a neighborhood now comparatively empty, and of getting some return for valuable property that has been lying unproductive vainly awaiting purchasers. But it would seem a mistake to attempt to draw population back to the heart of the city. It is the peculiarity of Glasgow that the laboring people live on the inner circle of their work; and this has been so frequently deplored that it would seem decidedly a reactionary move for the authorities themselves to build tenements with the view to bring back the very people whose dispersion to the suburbs has always been regarded as so important a desideratum. It is, however, the best class of working people for whom the city is providing these new houses, and the real motive seems to be the promotion of a market for the adjacent property. Whether wise or unwise, this experiment is not upon a sufficiently large scale to have very significant results.

Much more important and interesting is the experience of Glasgow in providing common lodging-houses. Every large city has a transient and shifting element that finds accommodation in the cheap lodging-houses, and these places are too frequently the haunts of vice and crime. They had been particularly bad in Glasgow until brought under strict regula-

tion by the new police acts. There was also an almost irresistible tendency to overcrowd the smallest and most wretched tenement apartments with nightly lodgers of the abjectly poor class. Partly to relieve this pressure and to assist somewhat in the readjustments of population necessitated by the improvements scheme, and partly to institute a competition that would compel the private keepers of such houses to improve their establishments, the council committee in charge of the improvement works opened two model lodging-houses in 1870. So decidedly successful in every way were these institutions that another one, in temporary quarters, was opened in 1874, to be replaced by a large and permanent one in 1876. Three more large houses on the same plan were opened in 1878, and a seventh and last in 1879. They have continued to be an unqualified success. Their incidental advantages as a police measure, in promoting the good order of the city, can hardly be overestimated. The common lodging-house inspector has now 101 houses on his list, although the city's seven establishments provide about one-third of the total accommodation, having nearly 2000 beds out of a total 6273 reported by the inspector. It is a pleasure to visit these municipal hostleries and see for one's self how cleanly, comfortable, and decent they are. Every lodger is given a separate apartment, or stall, in one of the high and well-ventilated flats, and has the use of a large common sitting-room, of a locker for provisions, and of the long kitchen range for cooking his own food. The charge per night is $3\frac{1}{2}d.$ or $4\frac{1}{2}d.$ (7 or 9 cents), according to the lodger's choice of a bed with one sheet or with two. (In any case he rests on a woven-wire mattress.) Six of these houses are for men, and one is for women, the charge in the latter being only $3d.$ The regulations require of all the common lodging-houses of Glasgow that they shall be exclusively for one sex or the other. The success of the corporation's houses has had the good effect of leading private enterprise to open a few similarly improved establishments, with the same scale of prices and conducted on the same strict rules as regards good order and cleanliness. I find that the city's six houses for men, during the year ending May 31, 1888, entertained 647,681 nightly lodgers, and that the house for women, which is smaller than the others, entertained 33,986. The returns for the preceding year are about the same. The cost of the houses, which are substantially built, was about \$450,000. After paying all running expenses and a due amount for deterioration of property, they yield a net return of from four to five per cent. on the investment. It costs about \$6000 a year to

"run" one of the houses, and the receipts are from \$8000 to \$9000. They are, therefore, a source of actual profit to the city, although of course designed primarily to promote good order and the welfare of the unfortunate classes. So far as I am aware no other city has made an experiment of this kind, at least upon so large a scale, and Glasgow's experience has peculiar interest.

PUBLIC BATHS AND WASH-HOUSES.

As a part of that large scheme of sanitary and social amelioration that I have thus far been describing are to be regarded the great public baths and wash-houses of Glasgow. Power to establish such places was obtained in the police acts of 1862-66; but it was not until 1878 that the first one was opened. Glasgow was not at that time at all well provided with baths; and if private capital had been disposed to embark extensively in the business, the common council would hardly have ventured to add this to its undertakings. But there was manifest need, and the authorities courageously proceeded to supply the facilities *pro bono publico*. They have now five large establishments in different parts of the city, the first of which was opened in 1878 and the last in 1884. Each includes under the same roof very capacious swimming-baths for men and for women and numerous small bath-rooms, every modern facility being provided; and also, as a distinct feature, an elaborate and extensive wash-house for the use of poor families that lack home conveniences for laundry-work. The substantial character of these institutions will appear when I state the fact that, although honestly and economically built, they have cost more than \$600,000.

The swimming-baths are kept open through the entire year, at a uniform temperature, and the pure and soft Loch Katrine water makes them particularly inviting. Their establishment was an inestimable boon to the working classes, who needed them as a common decency of life, and who enjoy them as a luxury. They are in charge of competent swimming-masters, and there are swimming-clubs and frequent contests in connection with each of them. Glasgow affords the masses so little healthful recreation comparatively that this feature of the baths is the more appreciated. The number of bathers exceeds 400,000 a year, and there is reason to believe that it will increase rapidly; although the present average of 1300 per day the entire year through would seem to justify the city's outlay. The charges are of course small—twopence for use of swimming-bath, and a little more for the private baths.

Hardly less useful in the cause of public

cleanliness and decency are the wash-houses. For the trifling sum of twopence an hour a woman is allowed the use of a stall containing an improved steam boiling arrangement and fixed tubs with hot and cold water faucets. The washing being quickly done, the clothes are deposited for two or three minutes in one of a row of centrifugal machine driers, after which they are hung on one of a series of sliding frames which retreat into a hot-air apartment. If she wishes, the housewife may then use a large roller mangle, operated, like all the rest of the machinery, by steam power; and she may at the end of the hour go home with her basket of clothes washed, dried, and ironed. To appreciate the convenience of all this, it must be remembered that the woman probably lives with her family in one small room of an upper tenement flat. The number of washings done in these houses increased from 76,718 in the year 1885-86 to 96,832 in the year 1887-88; and unquestionably this patronage is destined to have a very large future growth.

It would be a decided oversight not to mention the fact, in passing, for the sake of those interested in noting the advancing socialism of the day, that in each of these establishments the city also separately conducts a general laundry business, drawing its patronage from all classes of society. I observe by reference to one of the printed municipal wash-lists that its charges for shirts, skirts, etc. are at about the current Glasgow rates. This line of enterprise has doubtless been entered upon because the baths and wash-houses, while paying running expenses, do not as yet, at their low rates of charge, pay interest upon the investment. This rather undignified entrance of the municipal corporation into competition with the private laundries of the city can hardly find permanent favor; but this is merely incidental, and it detracts nothing from the praiseworthiness of the public services rendered by the baths and wash-houses.

THE CORPORATION GAS WORKS.

HAVING made the municipal water-supply, dating from 1860, a grand success, having next begun a corporation park system and then a consolidated market system, and having entered vigorously and hopefully upon the sanitary and city improvement schemes already described, Glasgow was prepared in 1869 to undertake another large municipal enterprise. In that year, after much difficulty in adjusting the details of the arrangement, the gas-supply of the city was transferred from private hands to the corporation, to be managed by the council as an ordinary department. The

original cost exceeded \$2,600,000. Twenty years of management by the authorities has given unmitigated satisfaction to all the citizens of Glasgow. The quantity of gas sold has increased from 1,026,000,000 feet in 1869-70, the corporation's first year, to 2,427,000,000 in 1887-88, an increase of 140 per cent., while the population has grown only 20 per cent. In 1869-70 the amount manufactured was 20 per cent. greater than the amount sold or accounted for. Careful management has reduced this amount of leakage to about 10 per cent. More than 130,000 meters are in use; and as it is not the policy of the corporation to charge its customers for more than they actually receive, it is inevitable that there should be a considerable percentage of loss in delivery. From \$1.14 per thousand feet, which was charged consumers in 1869-70, the corporation has been able to make reductions year by year until for 1888-89 the price was fixed at sixty-six cents. No one will claim that a private company would have made these reductions while continuing to supply a satisfactory quality of gas.

Yet the department has been able to construct new works,—it now owns three large establishments,—pay its interest charges and running expenses, write off large sums every year for depreciation of works, pipes, and meters, and accumulate a sinking fund which now exceeds \$1,000,000. Its total indebtedness was at the highest point in 1875, when it reached \$5,330,000. The net debt is now reduced to about \$2,400,000, which is very much more than covered, of course, by the value of the plant. Whatever competition gas as an illuminant may have to face in the future, the Glasgow corporation works have now reached a point of perfect financial security.

In the rather gloomy winter climate of Glasgow, which necessitates a large use of artificial light, cheap gas in all the tenements, however humble, and in every passage-way, is an inestimable blessing; and the more than doubling of the *per capita* use, under the city's management of the works, means a vast increase in comfort and happiness that defies statistical expression. Great wisdom and humanity has been shown, therefore, in the policy of smaller earnings and a less rapid debt-payment for the sake of a more rapid reduction of the charge to consumers and a more rapid growth of the total consumption. These considerations of the general good, which dominate the public control of such services as those of light and water, can have only small weight in the councils of a private money-making corporation; and herein lies perhaps the most fundamental reason for the municipal assumption of these functions.

It remains to speak of the recent experiment of the Glasgow gas department in supplying gas cooking-stoves, either selling them at about cost price, or renting them at a moderate charge by the year, half-year, or quarter. To understand the local application of this experiment, it is necessary to recur to the fact that fully 70 per cent. of the people of Glasgow live in houses of one or two rooms, using the same fire for cooking and heating, but spending as little as possible for mere heat during eight months of the year. All these houses are fitted with gas for illumination. An immense saving would be effected by the use of gas for cooking, besides the consideration of comfort in the summer months when fires for heating are not an object. And these same considerations apply to a majority of the families living in more than two rooms. The city recovers in rents a fair interest and depreciation charge on its investment in stoves, and is at the same time extending the market for its gas. For more than three years this business has gone on briskly, the city having from \$60,000 to \$70,000 invested in stoves. During the year 1887-88 there were sold 1193 heating and cooking appliances, and 1465 were rented. It can hardly be deemed a permanent feature of the gas department.

THE CORPORATION'S STREET RAILWAY SYSTEM.

IN all of Glasgow's municipal experiences I find nothing more likely to interest American city authorities than that which relates to street railways. It is an experience which may well make American cities blush for their own short-sightedness. Street railways, or "tram lines," as they are generally called in Great Britain, are an American invention, and the first ones in London and some other English towns were constructed by American companies. It was that enterprising American citizen George Francis Train who first proposed to build tram lines in Glasgow. Having laid a line in London and another in Birkenhead, Train undertook in 1861-62 to get parliamentary authority to begin operations in Glasgow. His bill was opposed by the city authorities, who "headed him off" by inserting in a bill, then pending for the increase of the city's powers in other directions, a clause giving the council power to lay tram lines. The new power was not utilized, however, and in 1869-70 two syndicates, one or both being of American origin, again promoted bills in Parliament for power to invade the Glasgow streets with a horse railway system. Again the authorities were aroused, and the result was a compromise all around. It was

agreed that the city should keep the control of its streets, any part of which it was so averse to surrendering; and that it should construct and own the tram lines, while the two syndicates were to unite in one company and work the lines on a lease. The first lines were opened in 1872, and the lease then made is to terminate in 1894. By its terms the company was required to pay to the corporation (1) the annual interest charge on the full amount of the city's investment; (2) a yearly sum for sinking fund large enough to clear the entire cost of the lines at the expiration of the lease; (3) a renewal fund of four per cent. per annum on the cost of the lines, out of which they were to be kept in condition and restored to the city, in perfect order and entirely as good as new, in 1894; and (4) a mileage rental of \$750 per street mile. Such were the money conditions of the lease; and certainly the city's interests were well looked after. But meanwhile the interests of the public as passengers were equally well secured. First, it was provided that in no case the charges should exceed a penny per mile. This, it should be remembered, was at a time when fares were nowhere less than 2*d*. Further, the parliamentary act described a number of important "runs,"—those most likely to be used by laboring men and large masses of population, and several of them considerably exceeding a mile,—and specified that one penny should be the charge for these, and that morning and evening cars should be run for workmen at half price, equal to one American cent.

The company which secured these remarkable terms took advantage of a passing mania for investment in tramways, and sold the lease to a new company of local capitalists for a premium of about \$750,000. This new company experienced hard times for two or three years; for besides running expenses, interest upon the capital invested in the business, and the heavy payments on the four accounts to the corporation, there was the burden of the enormous premium to carry. Not until 1875-76 did it begin to pay its stockholders dividends. Since 1880, however, the business has flourished, and dividends of from nine to eleven per cent. have been paid, after writing off each year a due proportion of the unfortunate premium charge.

The city is so compact—covering, as I have said, only 6111 acres of ground—that a large mileage of tramways was not to be expected. The present total of thirty-one miles serves the public very well, the system providing continuous lines across the city from north to south and from east to west, with convenient access from the center to almost every outlying neighborhood. In arranging the system originally, just

at the time when the great improvement scheme was fairly begun, the authorities had in mind a service that would help them to relieve the central congestion of population and would aid in the symmetrical development of the city. To this end they wished to build certain additional lines that did not seem to the operating company to promise immediate profits. The system, as scheduled by the act of Parliament, embraced about seventeen miles of lines, and the city found that it had no authority under its lease to compel the company to work additional lines on the same conditions. A compromise was made by which the company agreed to pay the interest and the renewal cost upon the new lines and was relieved from rental and sinking-fund charges. This was perfectly fair under the circumstances.

The total capital investment of the city has been a little more than \$1,700,000, interest charges upon which are paid by the company. On the 1st of June, 1894, the sinking fund provided by the company will have reached somewhat more than \$1,000,000, which will pay the full cost of the original system. There will remain the cost of the newer lines, some fourteen miles in extent. The renewal fund will have left the system in perfect repair, and the city will have received in rental money a sum amounting to about \$225,000. As for the company, it will have paid off its premium incubus, will have earned good dividends, and will have made due allowance for depreciation in the value of its working plant.

When the time comes for making a new arrangement the city will be in condition to demand still more favorable money terms. The mileage rental under the next lease will doubtless be much increased; and the moneys which under the present lease have gone to sinking-fund and interest charges will accrue to the corporation as clear revenue. After 1894, therefore, the tramways of Glasgow will yield the municipal treasury a large income and will not require a penny of public expenditure. It is expected that a new lease will be arranged with the present company, which has a large capital invested, is excellently managed, and has always been just and honorable in its dealings with the corporation. That the rentals may be arranged on a sliding scale, or in some manner to make them partly dependent upon results, is not improbable.

VARIOUS OTHER DEPARTMENTS.

It has been deemed best to dwell in detail upon those features of Glasgow's municipal government that are most distinctive and most likely to have interest for other communities. There are various other functions and under-

takings of this vigorous administration that I should discuss with some fullness but for the space limits necessarily assigned my article. Glasgow is not unique in having a good water-supply, but it was one of the first great cities in the world to construct water-works of an ideal and permanent character. It had been wretchedly supplied with unwholesome water at high rates by private companies pumping from the Clyde. More than thirty years ago the authorities bought out these companies, obtained exclusive control of Loch Katrine in the Highlands, and brought to the city through a great aqueduct a magnificent and inexhaustible supply of pure mountain water. The expense was great. No private company could have been induced to undertake such an enterprise. Yet the city has been able easily to make the works pay for their own maintenance and enlargement, and to accumulate large sinking funds for the liquidation of the original cost, while reducing the water-charges rapidly from year to year and providing the most bountiful quantities for everybody that any British city grants. Glasgow illustrates the indirect advantages that a city derives from a good municipal water-supply. The great pressure in the mains, due to the high sources whence the water comes, suffices to extinguish nearly all fires without the use of engines; and the annual saving in the fire department alone is more than enough to pay interest charges upon the cost of the water-works. Moreover, Glasgow statisticians have convinced me that the absence of mineral ingredients from the water effects a saving in the two items of tea and soap that more than meets the cost of the works. Further, the pure and soft water, cheaply furnished, has made it possible to develop in Glasgow various important lines of manufacture that otherwise would have been driven to rural districts.

Glasgow has had an interesting experience in the matter of public illumination. The municipal gas works have made it possible to light the streets well at a low cost. But the authorities were not satisfied with lighting the streets. I have explained the circumstances under which the population is massed in tenement buildings, and the frequency of private alleys and courts used by great numbers of people. The authorities some years ago entered upon the policy of lighting private courts and passages as well as public streets, and further undertook the lighting of all common stairs in tenement-houses. The stair-lighting alone costs the city more than the lighting of all the streets, counting wages and gas. But the measure is one of great humanity as well as a police precaution of the highest value. A light is equal to a constable. The illumination of the dark passages has had a most marked

effect in diminishing crime. The presence of public lights on the tenement staircases has added to the comfort and security of the population, while facilitating the work of the ordinary police, of the night inspectors, and of the health officers. No other large city in the world, so far as I am aware, lights the staircases. Edinburgh has, however, lately resolved to follow Glasgow's example in this respect. It should be said that the expense of stair-lighting is partly met by a special assessment.

The municipal council, under acts which constitute a "market trust," manages the city's important market properties. All the wholesale marts for produce, meat, animals, and fish are in the city's own hands, and are so managed as to yield net revenue while facilitating the work of the public food inspectors and contributing to the healthfulness of the city. Belonging to this department are the great municipal slaughter-houses, which for many years have entirely superseded all private establishments, and which are admirably appointed.

It would be easy to devote several pages to the department of public works, under the control of Mr. John Carrick, who, as City Architect and Master of Works for more than forty years, is a mine of information upon every topic pertaining to street-making, bridge-building, sewerage, and the construction of public buildings, and who knows more than any other man about the material and municipal development of Glasgow. Mr. Carrick's office is supplied with a corps of competent architects and engineers, and it supervises every kind of municipal construction. But the actual work in Glasgow, as in every other British city, is always done by private contractors. The sewerage of Glasgow is not to be commended. The mains empty at frequent intervals into the Clyde, with the most malodorous results. It is intended to construct intercepting sewers on each bank, which will carry the material to filtration works below the city, from which point the "sludge" will probably be barged out to sea.

Of parks, picture galleries, and libraries also much might be said; but summary statements may suffice. Within the period of the recent improvements that have been fully described a park system has been formed, and its cost has in large part been defrayed by the re-sale at advanced prices of portions of the tracts originally purchased for park purposes. Bequests of important collections of paintings, chiefly by the old masters, have given Glasgow a municipal gallery of importance, and it is expected that the early future will witness the completion of an adequate art building and the rapid accession of modern works of art. Although the Glasgow people have hitherto refused to

adopt the Free Libraries Act, which almost every other important town in Great Britain has availed itself of, bequests to the city have founded two libraries, which are open to all readers and are of considerable importance. The Mitchell Library, though but a few years old, will soon have a hundred thousand volumes. It has the best supplied periodical reading-room in Great Britain. Mr. Barrett, the accomplished librarian, with the help of the council committee on libraries, has performed wonders in building up this collection of books; and it is to be hoped that his ideal of a great central library with ten branches, each having reference, loan, news-room, and lecture-room departments, may be soon realized through the adoption of the Libraries Act with its penny rate.

Poor relief and public education are not in the United Kingdom made functions of municipal corporations, but are intrusted to distinct elective local bodies. None the less, but for the exigencies of space, it would be quite within the scope of this paper to state briefly how the people of Glasgow provide for these two extremely important objects. In a word let me say that Scotland, urban as well as rural, is divided into "parishes," each of which has an elective board that levies poor-rates, dispenses relief, and has entire charge of the indigent; while

elementary education in Scotland is now universal and compulsory under the management of elective school boards, school taxes being collected by the several parish authorities, although the jurisdiction of the Glasgow school board extends over the entire city. A magnificent array of public school buildings has appeared in Glasgow since 1873, and admirable provision is made for technical education.

All municipal taxation in British cities takes the form of rates levied upon the rental value of occupied lands and buildings. In Glasgow the rates are divided between owners and occupiers in a manner which could not be described without going into much detail. The general financial position of the municipality is excellent. Its debt is not formidably large, and most of it is potentially covered by the growing sinking funds of prosperous and productive departments. The numerous undertakings of the municipality, far from imposing heavier burdens upon the rate-payers, promise in the years to come to yield an aggregate net income of growing proportions, to the relief of direct taxation. Glasgow has shown that a broad, bold, and enlightened policy as regards all things pertaining to the health, comfort, and advancement of the masses of the citizens may be compatible with sound economy and perfect solvency.

Albert Shaw.

ROBERT BROWNING.

(DECEMBER 12, 1889.)

SOFT falls the snow upon the fading year,
 As death falls softly on the quiet face
 By which we fain would stand a little space,
 To drop the silent tribute of a tear,
 And lay the laurel-wreath upon the bier,
 Where sleeps in peace, as if in love's embrace,
 He who so long hath held his lofty place,—
 Our crownéd singer, our belovéd seer!
 Who kept his faith undimmed in faithless days;
 Whose witness for the *right* was stern and strong;
 Whose life was true and earnest as his song;
 Whose love was noble as his poet's bays.
 What meed for him whose working-day is done?
 Rest with his love,—and joy eternal won!

Agnes Maule Machar.

SOME WAYSIDE PLACES IN PALESTINE.

JACOB'S WELL.

THE student of the Gospel according to St. Luke gathers the impression that in the time of Christ Palestine must have had a large number of thickly settled cities and villages. Such, indeed, was the fact. The district of Galilee alone, says Josephus, contained 204 places, each with an average of 15,000 inhabitants. That would give the 2000 square miles of Galilee a population of quite 3,000,000. What a number of people Jesus must have reached, then, in his short ministry, aided by "the twelve" and the chosen "seventy"; for Luke declares "that he went throughout every city and village, preaching and shewing the glad tidings of the kingdom of God."

The modern visitor finds no little difficulty in verifying this record. All that I can hope to do is to round out the series of descriptive papers which have appeared in this magazine¹ by presenting notes and illustrations of some wayside places which have not had attention. Some of these gain fresh interest because they are involved in the Gospel record selected for this year's International Lessons.

In the time of Christ Samaria seems to have formed the southern border of the Plain of Esdraelon, extending all the way from the

Carmel hills on the west to the Jordan depression on the east.

The district of Galilee covered all that lovely region which was apportioned to the tribes of Issachar, Zebulon, Asher, and Naphtali; and the little cluster of Galilean towns which we shall visit are, with one exception, located in lower Galilee, upper Galilee having already had our attention.

Coming up from Shiloh we soon cross the line which separates Judea from Samaria. After an invigorating climb along the shoulder of Mount Gerizim, a descending bridle-path appears, which leads down to the most sacred spot in all the Vale of Shechem — Jacob's Well. Not very far away, surely, must be the very spot where the Saviour held the conversation with the Samaritan woman. Beneath one of the ruined arches of the church which once stood here, a few feet below the surface and reached by rude steps, is the mouth of the well. Its sides are splendidly walled, and one can see his face reflected in the water sixty or seventy feet below. The original depth of the well was over a hundred feet, and it is seven and a half feet in diameter. A person not acquainted with the condition of the country might wonder why so much expense of time and money was undertaken in order to provide such a well, when a great abundance of water is supplied to the neighboring valley by the bordering mountains, Ebal and Gerizim. It was really a safeguard against marauders. It is also true that the custom of sinking wells on an estate began as far back as the time of Abraham and Isaac, and these old wells are still guarded with the most jealous care. While the photograph was being made my old Samaritan guide, Jacob es Shellaby, sat by the broken arch which covers the well, and then led me down to the great flat stone at the mouth. Through a circular hole in the stone the natives pass their skin vessels and bring up the water, which flows alike from the deep-sunken arteries of the mount of cursing (Ebal) and from the mount of blessing (Gerizim). The Jew, the Samaritan, the Christian, and the Mohammedan alike reverence it, and it is no uncommon thing to find them praying together near at hand; one with his face turned religiously towards Gerizim, another facing the east, a third gesticulating in the direction of the vale between the mountains,

JOSEPH'S TOMB.

while the fourth bows with his face turned towards the scattered ruins of the church which the Crusaders erected over the sacred site. The mountains are there just as Jacob, Joseph, Joshua, and Jesus saw them — Ebal northward, with its high terraces of prickly pear; Gerizim rising in the south from its rich grain fields and groves of walnut and sycamore.

About an eighth of a mile across the valley from Jacob's Well, and near the base of Mount Ebal, is the traditional tomb of Joseph. It is marked by a rude inclosure twenty feet square and twelve feet high. The interior of the structure is divided into two sections, of which the one to the south is the tomb. It is about six feet long and four feet high, and resembles the common tombs erected in all parts of the country in memory of Moslem saints. I do not remember any more enchanting walk in Palestine than the descent from Shechem down the valley to where it begins to widen and then northward to Joseph's sepulcher. The rugged peaks of Moab puncture the hanging mist and catch their share of color, and the rocky face of Ebal stands out in fine contrast to the splendid olive groves and the highly cultivated fields of the valley. Farther on, rising from a great mass of

olive trees, is a picturesque old tower, half covered by clinging vines, called Jacob's Tower. It is said to have been the home of the patriarch when he sent Joseph over to Dothan to look after his brethren. The nearer we approach it the higher it seems to reach up the side of Mount Gerizim, near which it stands, and the great trees are dwarfed by it.

The present inhabitants of Shechem devote a great deal of time to their religion, and it is interesting and picturesque to see an assemblage form on a "religious day." The people come in from the neighborhood in companies, dressed in every variety of clothing, and moving along under the shade of the splendid trees without much apparent purpose. Many stop at the wells and quench their thirst; others lave in the stream or rest upon the rocks and grass. The scattered groups on the highway gradually become a dense throng and press onward to some designated place. As

the multitude increases the excitement grows, and in all directions heated debates go on. At last a low, flat-roofed building, with a great open space near it, is reached, and the people halt. On the housetop, with green turban, stands the "holy man," who works his audience up to a frenzied condition, and then sends them away ready for any violence to which their fanaticism may lead them. Shechem is not a pleasant place for Christians.

The pride of Shechem is its olive groves. The olive, no matter how young, always looks old and care-worn when it stands alone. When cultivated in orchards or groves, however, nothing in the country is more beautiful. The bark seems to granulate and scab as soon as it becomes of any thickness, and the short stems hopelessly twist before they have any girth; but nature averages her favors, even with the olive, for an abundant foliage is supplied to hide all deformities. When the cool breeze disturbs the leaves they turn first their green and then their gray sides to the light, with the steady movement of the palm branch.

Just as the center of the town of Shechem is reached we notice that the water-shed no longer flows Jordanward, but begins to

meander westward on its journey to the Mediterranean. Soon after the mountains are left behind a wide basin opens to view. On each side of the river the terraced hills incline gently like the banks of the lower Rhine, and long lines of aqueducts, and now and then a vine-covered Roman arch, rise up and remind one of the Hauran. The clatter of mills is heard, and the tinkling of bells announces the near presence of flocks; repeatedly we see an adventurous sheep or goat, stationed on a protruding rock, lowering its head with threatening aspect and stamping its forefoot in anger at our audacious approach.

After an advance of about a mile and a half westward the glen narrows and the inclines on each side grow more precipitous. In a little time the dragoman leads northward up a steep and stony road. The sound of water is left behind, and the trees and flowers are exchanged for obtruding stones and rank thorn bushes. Journeying on, after a tough grapple with a bare, bald ridge, the fertile valley and the brook again are seen. The sides of the hills in all directions are dotted with fig, sycamore, and olive trees. Apples, pomegranates, and apricots also abound. Every knoll is crowned with a village, and life and prosperity are indicated by the sounds which come from them. The narrow bridle-path follows the valley, descends through splendid groves, and then, turning abruptly to the west, leads upward, say five hundred feet, to the summit of the oval hill upon which historic Samaria stands. Only the eastern side is approachable. In other directions the inclines are so regularly terraced and so thickly clad with verdure that they have the appearance of being under a high state of cultivation. The hills encircling Samaria cause the elevation on which the place stands to look like a cone rising from a great crater. Towards the sea is visible the top of Mount Carmel; towards Galilee, Mount Tabor; towards the Jordan, Hermon, Little Hermon, and Gilboa; and southward, Ebal and Gerizim; while in the north, like the light clouds above them, rise the snowy peaks of Mount Lebanon.

The usual camping-place of the sojourner

is at the top of the hill near some fruit trees, and only a short distance from the ruins of the old Church of St. John. A requisition was made upon the camera there one morning, which resulted in a curious picture, showing examples of architecture representative of three periods in the checkered history of Samaria. The first is the black tent of the Arab, probably in no respect different from the ones inhabited by the patriarchs when they watched their flocks in the adjoining fields; the second is the squalid stone domicile of the permanent dweller in

"WITHOUT PURSE AND SCRIP."

Samaria; and the third is a picturesque portion of that remarkable memorial of the indomitable energy and genius of the Crusader, joined perhaps with suggestions from the Saracen.

I am free to confess that I did not meet the proverbial good Samaritan as I journeyed through this much-favored country. If one meets a tiller of the soil he will sidle off as far as the narrow path will allow, and scowlingly watch the traveler's approach. The offer of a piaster will bring him to a standstill.

"How far is it to Nain?"

"God knows," comes the fervent answer.

"How long will it take to go there?"

"As long as God pleases," he answers, with a shrug of his shoulders and a pull at his pipe.

"Shall I reach there by noon?"

MOUNT TABOR FROM NAIN.

"If God permit."

"But may I hope to make the distance in an hour?"

"As God may direct," he answers, walking away.

"Is Nain distant, or is it very near?"

"There," he answers, moving his finger through a wide arc. If one extracts a more neighborly spirit than this from a Samaritan he must have the mysterious power of a dervish.

As I drove away from the Samaritan's country I heard rude music and the firing of guns. A wedding feast had been going on in the valley below, and the bride and the groom, with an attendant procession, were coming towards us. A crowd of young people accompanied the happy twain, with the intention of fulfilling the Bedouin idea of hospitality by seeing the guest a half-day's journey on his way. The groom was the guest. He had come over from Shechem for his bride, and was taking her home. He was a tall, well-built swain, but very awkward, and hardly

seemed to know what to do with himself. Sometimes he would walk and again he would jump up behind his wife, who rode cross-legged on a mule. She was a pretty little creature, with merry, bright eyes. She and her still more merry attendants gave me a good opportunity of studying the faces of the Samaritan women, for their faces were not veiled. All were in holiday costume, and were singing as they went; the young men in front and at the rear taking up the song in responsive verses. The hills which rise right and left as one rides down from Samaria to Jenin are beautiful. Some of them are of considerable height; some are bare and rocky, though the greater number are verdure-clad. The surroundings of the homes on the mountains are sometimes very attractive, for the people have a way of winning their vineyards to grow where to a stranger's eye there seems but little soil. The tall and majestic date tree is much more frequently seen here than it is either south or north, and is always a sure sign of a neighboring habitation. Near a group of mulberry trees and lofty palms a roadside fountain was found. Around it, some beating their laundry with olive-wood clubs upon the stone water-troughs and some filling

their water-pitchers, were a number of girls. The faces of some of them were very pretty and bright. It was not surprising that in these days they should know the use of the camera; and no sooner had a chance shot been made at them than each particular water-jar stood on end and the unfortunate disciple of Daguerre was beset for bakshish, and almost belabored by the black-eyed water-carriers. One poor little girl had no jar, and had substituted a square tin can which had served originally to carry American kerosene.

It was just at sunset that my path led me across a plain and up the hill which brought me to the outskirts of the town of Jenin, close to the southern border of the Plain of Esdraelon. The departing sun gave its last touch of color to the head of the minaret of the little mosque which overtopped even the palm trees. Our Moslem attendants were all down upon their knees, with their faces towards Mecca, and the village fell asleep in the shadows.

In Palestine one may choose his route but not his resting-place. His conductors have their "stations," where it is the custom to halt for the night, and they do not willingly change. Jenin is not a large town, but it is rather more attractive than the majority of its neighbors, not only on account of the beauty of its natural surroundings, but owing to the abundant water supply, which is brought by a covered aqueduct from the hills back of the town.

One of the first things that impress one, when he rides out from Jenin towards the north and overlooks the vast plain, is the fact that not a single tree appears to break the landscape.

For the ride from Jenin to Nazareth we took the road that led us around the shoulders of Mount Gilboa, and then along the red soil roads through the pleasant fields until we reached Shunem, the proper "station" for the noontide rest and lunch. The town is entered by a long avenue of monstrous prickly-pear plants, the horrid arms of which reach out on all sides, as if to conceal the ugliness of the unsightly town. It is not all ugliness at Shunem, however, for some pretty gardens are there. In one of them I saw a number of lemon trees as high as apple trees, with all stages of fruitage going on, from the fragrant blossoms to the ripe ovals of gold which hung from the sturdy branches in great abundance. Through the huge cacti the Arab women could be seen beating their clothing on stones at the brookside.

A glance to the northwest reveals the gray

outlines of Mount Carmel with the wide plain between; but the best outlook from the Shunem housetops is in the opposite direction, and takes in that peculiar range known as "Little Hermon." Little Hermon is shapeless and barren and holds no historical interest, yet it provides an attractive feature in the landscape. It presents its best side towards Shunem.

None of the generosity which characterized the "great lady" of Shunem seems to mold the conduct of the modern Shunemite towards the stranger; for when I plucked a single lemon blossom from a tree overhead to send to America in a letter I had just written to a little girl,

THE CASTLE OF JEZREEL.

one of the nabobs of the town, who had stood watching my comrades and me, flew at me in a great rage and demanded bakshish. I had proved myself to be a thief as well as a trespasser, and it turned out to be one of those occasions where I found myself unable to dispense justice. I referred the case to my wise dragoman, who had quite an altercation in my defense.

Jezreel must also have received a Divine visit. Its location is central, and its position as a military stronghold admirable. Its approach is from the east. On the northeast there is a steep cliff, quite a hundred feet in height, from the top of which the view is grand. The Arabs call the town Zerin. Their houses are dreadfully humble and comfortless, and all the wealth of the town seems to have been used for the preservation of the ancient tower which stands among the houses. It

CANA IN GALILEE.
(AFTER A PHOTOGRAPH BY BONFILS.)

seems in a strange place among such a benighted people, and serves to show with what reverent care they preserve what they consider holy. If Ahab and his four hundred priests worshiped Astarte here, and Herod kept up the unholy rites, it is a holy place in the eyes of the present dwellers at Jezreel, but none the more holy because Jesus did missionary work among their predecessors. The same crescent moon that shone as the symbol of Astarte shines for Mohammed their prophet, and for this they honor and preserve Jezreel's tower.

From Jezreel to Nain is a ride of but an hour. The western base of Little Hermon is on one side, and the broad expanse of the valley of Jezreel is on the other. As soon as Little Hermon is passed Mount Tabor is seen, and the prospect widens; then, soon after, the gilt cross on the convent at Nain shines out. Few and poor enough are the houses of Nain. Heaps of rubbish and the rough-quarried debris of better days surround the memorable town. The nearest hillside abounds with rock-tombs, and a number of shrines and holy places are dotted about.

Not more than a dozen miles from Nain

GENERAL VIEW FROM THE WEST. (DRAWN FROM NATURE.)

there is a hopelessly desolate little town which can be seen from half a dozen places already mentioned in these journeyings. It is almost north of Nain, and is well worth a visit. If one journey there early in the morning, his horse ought to carry him from Nain in less than three hours. It is the place where Christ met the rejoicing wedding party and performed his first miracle — Cana of Galilee. I do not know of a ride of its length in Palestine which is more lovely, or which presents so many points of interest as this does. Before one gets fairly down into the plain he may see the rosy light coming over the Anti-Lebanon range, tipping the minarets of Jezreel and Shunem. Gilboa and Little Hermon will also have their feathery, pink-hued caps. Before the first hour is gone he comes to the Fountain of Jezreel and begins to meet the modern young Gideons as they come back to the pastures with their flocks after watering them at the fountain. As we too stop to water our horses at the fountain we cast our eyes upward to see if we can

make out the outlines of the ruins on Mount Tabor. The fog is flying around the summit; but there, peering through it, looking five times their real height, their fine details brought out by the morning light and the blue background of the sky, are the gray towers and bastions placed there by the Crusaders. Forging the stream, we now push our horses up towards Tabor, and above the fog line. Nain and Shunem and Jezreel rise up behind in the distance. We soon place Mount Tabor between us, and hurry on.

In half an hour we see on the left a hill topped by a little village. It is Sefurieh, the ancient Sepphoris, and is all that remains of the old-time capital of Galilee. It was an important place until Herod Antipas came into power and made Tiberias the seat of government. The caravan tracks which cut across the country now bewilder us somewhat, for we are in doubt which one to choose. However, they all lead to the Mecca of the present expedition. If the face is kept well towards the northwest one comes out all right. Here and there we meet a group of women with bundles of twigs on their heads. Already they have been up the side of Mount Tabor, among the scrub oaks, where they gather the scraggy merchandise which they are now carrying to the wood market in Nazareth. Now the scene grows still more animated, for men and boys, and women too, are seen driving towards Nazareth long lines of asses laden with newly cut

grass. In the proper season figs and olives take the place of grass, for the trees abound. The narrow plain is beautiful, and provides the space for a last gallop before reaching the almost deserted village of Cana of Galilee, known to the Arabs as Kefr Kenna. The chief entrance to the town resembles that of Shunem, a lane skirted by thickly set prickly-pear plants. The houses remind one of those at Magdala. They are of mud and stone, surrounded by the refuse of the stable, and have miserably constructed arbors of cane on their unsafe roofs. They appear to be in the last state of ruin, yet there are plenty of ruins of an earlier date and of a better grade lying around in every direction. An old sarcophagus serves as the public water-trough, and is kept supplied by a cheery little stream which comes from a neighboring spring. "Dutch" ovens smeared with mud are standing near some of the houses. They might be taken for tombs only they are not whitewashed. Down towards Nazareth and over in the direction of Mount Tabor the views are particularly fine. The hills are not so high, so steep, nor so bare as those in lower Galilee. They are usually wooded to their summits and fall gradually down to the valleys. There is not the appearance of thrift that there is about Nain and Shunem, for the reason, perhaps, that the neighborhood is infested more by wandering marauders, who care nothing for the cultivation of crops so long as they find pasture for their flocks.

Edward L. Wilson.

THE SELF-PROTECTION OF MR. LITTLEBERRY ROACH.

I used to seem curious to me that the poor make earlier marriages than the rich. Not reared to expect luxuries, knowing that two persons in entire accord can live more cheaply together than apart, usually they mate young. Having little besides themselves and their affections to give, they exchange these brief courtships, and go cheerfully to the work and to the enjoyment of their joined lives, in which there is scarcely anything to lose but much to hope for. The rich, contrariwise, often make delays from one and another cause, less seldom follow the promptings of their own hearts, are more concerned about the conveniences of such alliances, and sometimes are solicitous as to whether or not they may be made to give more than they receive.

Such always heretofore had been the matter

with Mr. Littleberry Roach, who, although ever open-mouthed in praise of the other sex, was, at forty-five, still a bachelor. Unfortunately for any conjugal experience to him, he found himself, at twenty-one, the inheritor of six negroes and three hundred acres of well-stocked land—a fortune for those times. In spite of the gauntness of his long figure, the absence of smoothness from his visage and his manners, knowing that many a cap was to be set for the sake of other things that he had, he put himself upon his guard against feminine influences except such as were backed by property qualifications equal to his own. Yet he would admit freely his weakness in the presence of manifest beauty, even when undowered. Often had he been heard to say about thus:

"Yes, sir; yes, sir; when I see a putty girl it always warm me up, no matter what kind o' weather, and I feel like I were a kind o' break-in' out, like people does 'long o' heat, or the

measles. Yes, sir, that 's me, shore, and I can't he'p it. But you know how it is with a man that he have prop'ty; that he got to keep a' eye on hisself, and not liable to fling hisself away a jes accordin' to his time-bein' feelin's, a-givin' everythin' and a-gittin' nothin'. Yes, sir, 't wer' n't for that, they ain't no tellin'

"Yes, sir; yes, sir; I got to positive must; and I wish I 'd 'a' done it long ago; and I would 'a' done it exceptin' I were afeard o' bein' tuck in. For jes lo and behold all this prop'ty round me which have been a-increasin' a constant ev'y sence my parents palmed it off on me; and if anybody in this whole section o' country

"HE LOOKED AT THE LADY AND SMILED."

how many times I might 'a' got married, jes betwix' me and you."

During the years passed since coming to his majority he had intimated to several ladies within, and above, and even somewhat below, his standard, his willingness, as he expressed it, to give and take; but all of these, when such hints became serious, had subdued their coquetries and intimated that they were not in the humor to make the exchange proposed. It never seemed to occur to him that his physical imperfections should be taken in abatement of his claims, and so those several disappointments availed not to hinder his keeping one eye upon himself in the midst of all unequal inveiglements, however tempting.

But now at forty-five he was beginning to ponder if his life, to some degree, had not been a mistake. Quite a number of women, whom he doubted not that he could have gotten, he now saw happy, prosperous mothers of families; while here was himself, grown wrinkled, and more and more gaunt with the drying up that had begun in him even when he was a boy. Conscious of always having wanted a wife, he must — indeed to himself it seemed that he positively must — do something that would clear away some of the gloom that was gathering over the future of his being.

have more kinfolks than me, and them all poor, I should like to know wharabout he live. In course, I know ev'y one o' 'em would be distrested in their mind ef I was to git married and in the courses of times have a lawful ar or ars, male or female, as the case might be, like the legislatur' say, and ev'y dad-fetchit one of 'em ruther see me at the bottom o' my grave than sech as that. Right thar, as the Scriptur' say, the shoe 's a-beginnin' to pinch. And it ain't that, exceptin' for the 'structions o' that Jim Sanky, I 'd be a reason'ble riconciled in my mind. I got to perteck myself somehow agin Jim Sanky; and, tell the truth, I feel the n'ces'ty o' perteckin' myself agin my kinfolks, who I wish to gracious some o' 'em had a been borned rich, or married rich, or got rich somehow, so all eyes would n't be on me and my deathbeds and dyin' hours."

The dwelling of Mr. Roach, not at all fine, but far too good for any old bachelor, was near the Ogeechee, four miles north of our village. His nearest neighbors were the Sankys, half a mile to his right as he stood in his front door, and the Harrells, a mile to his left. Mrs. Sanky, a widow, we will say of thirty-nine, tall, religious, somewhat demure during her married experience, but since the demise of her husband, a year or so back, seeming to notice

things theretofore regarded with indifference, had a snug plantation, a small but respectable bunch of negroes, all of whom and of which were encumbered by a twelve-year-old boy named Jim, who in this little story must have more prominence than he deserves.

"The said Jim Sanky," Mr. Roach often said confidentially to a large number of his neighbors, "yes, sir, I has cussed that boy a million o' times, more or less, and it have come to that I got to perてck myself agin him, even ef I have to fetch in the law, the deeficulty bein' that Jim have nobody to give him the hick'ry like Tommy Sanky done a endurin' o' his lifetime, and which, as for his poor widder, she don't seem adequate to the above, even if she were so disposed."

To the left the old man Harrell, survivor of his companion of forty-five years, dwelt with his daughter, Pheriby, of about the age of Mrs. Sanky, but fatter, comelier, and, though not confessedly less religious, much more vivacious. Twenty years ago Mr. Roach had sought her in his own ambiguous way; but she had married her cousin of the same name, and after the spending of all their joint property and the death of her husband she had come back to preside over the household of her father, prosperous, but old, and periodically extremely feeble.

Resolved on turning over a new leaf, Mr. Roach felt that it was fortunate there was an unencumbered widow, remanded, as it were, back to girlhood, and heir presumptive to an estate larger than his own, soon to devolve upon her by an aged father, and so he began to pay her the most pointed respects. It seemed to him well to begin with her by eliciting her sympathy for the trouble he endured in the case of Jim Sanky.

"Look like," he said, one early day, "the creetur' have a spite agin me, and the good Lord know for what it is, a exceptin' in his lifetime I got his pappy to give him the hick'ry for his oudacious. He a constant a-skearin' o' my mules, a-shootin' his gun at birds along the fence where they plowin' in my field anext to their'n, and it 'pear like, when his hounds jump a rabbit, he natchelly love for him and them to run over inter my cotton-patch. But his mother's a female and she's a widder, and it look like a man hate to fuss with them kind o' people, special when Jim got so big, it take more 'n a woman to handle him."

"If such a boy was my child," answered Mrs. Pheriby, "he 'd mighty soon find who was who betwixt me and him."

"Thar, now! I allays said it, that ef it have be'n Missis Pheriby Har'll's lot to have children she 'd of learnt 'em to know how to behave theirself."

At that very moment crept in Mr. Harrell; so much more feeble than when last seen by Mr. Roach, that, the latter's spirits rising at the sight, he resolved to be as agreeable to the old man as he could.

"How 's your healths, Mr. Har'll? You look ruther feeble this mornin'."

"Yes, ruther feeble, Berry; but to them that has faith and their titles is cle'r death ain't the molloncholy it's to them that has no God. How you, Berry? Time a-beginnin' to tell on you too. You may n't see it yourself, but you 're gittin' a heap stringier than what you was. You never was what a body might call fat, at no time; but you 're a-gittin' stringier a constant."

Mrs. Pheriby made some excuse and left the room. After some moments of preliminary talk, Mr. Harrell disclosed the occasion of his interruption of a chat that Mr. Roach had intended to make specially interesting.

"Berry, the membership in Jooksborough have got too big for the meetin'-house to hold all covenant, and so us all on this side the creek (in another county, to boot) be'n a-thinkin' o' puttin' up another over here if providin' the money can be raised, which is all put up exceptin' fifty dollars and shingles. I'm a mighty anxious to have the meetin'-house put up befo' my departure is at hand, as the 'postle Paul say, and I be'n a-waitin' to see you and ask in a 'fectionate way, how much from you, a-'memberin' it 'd be a-lendin' to the Lord which he 's shore to pay back ag'in after many days. What you say?"

Something like a shudder ran all through Mr. Roach, long as he was. He had been persuading himself that, for a worldling, his contribution of two, sometimes three dollars a year, which was fully up to the average, ought to compound for his shortcomings, which mainly had been on the line of profane swearing. Having heard of the scheme, something of neighborhood pride had induced him to resolve to give four dollars, possibly—according to the character of the solicitor—as much as five. Now, looking upon the feeble condition of Mr. Harrell, a feeling of liberality was rising in his breast, and in a moment more he would have announced, in as generous tones as he knew how to employ, ten dollars. But at that moment Mrs. Pheriby returned, and said:

"Now, Pa, I thought I was to have the asking of Mr. Roach about our new church, which I have but very little doubts he 'll make up the balance, a-expectin' to git his rewards in various ways."

Mr. Roach, believing that he understood the meaning in her eyes, rapidly going over in his mind the silent clamors of his relatives, feeling that now was the time, and Mrs.

Pheriby the person, drew a long breath and answered:

"I 'll do it."

He looked at the lady and smiled. She looked at him and smiled. Her father, too far gone to notice such things, said:

"Now, Berry Roach, I know you feel good, jes as well as if I was inside o' you, and my hopes is it may all be blest to your conviction and your conversion from your many folds o' sin and temptation, and not keep on a constant a-gittin' older and older and stringier and stringier, and not a-layin' holt o' the plan o' salvation, which a man like you that 's got no wile it may be hopin' agin hope, because then *her* pra'ars, if she was a Christian woman, they ain't no tellin' what they might 'a' done in the salvation of your immorchal soul."

It relieved Mr. Roach of some of the embarrassment at these words that in their midst Mrs. Pheriby, with handkerchief to her face, again rose and left the room. Just as he was about to go, she came back and said:

"Good-by, Mr. Roach. I 'm ever so much obliged."

Her intelligent smile as she withdrew her hand from his light, affectionate squeeze made him feel that he never would wish to look upon a lovelier female. When he returned home they told him that Jim Sanky and his hounds had been running rabbits up and down all over the cotton-patch, destroying unknown quantities of cotton; and that two of the men even had to leave their work in the field in order to protect the sheep in the pasture into which these marauders had entered, after their previous destruction.

"Consarn the creetur'!" said he; and but for the pleasant memories of his recent visit he would have employed yet stronger words. Mrs. Sanky being a neighbor, and a widow at that, he felt that he ought, in a neighborly way, to ride over, and through her send to Jim a warning more serious than any yet conveyed to him. Although she had the reputation of being a person with a temper of her own, he had never been witness to its exhibitions. Then Mr. Roach was a man as gallant in feeling as he was long and stringy in bodily shape, and he would have borne far greater outrages from Jim rather than inflict any punishment of which his mother might have just cause to complain.

Seeing his approach, Mrs. Sanky had shifted herself into her next best Sunday frock, and in her haste threw over her shoulders a white cape, looking in the contrast more attractive than Mr. Roach remembered to have noticed for quite a time.

"My!" thought he; but he did n't say so in words.

"Why, the good Lord help my soul, Mr. Roach," she said, when informed of the object of the visit, "what is a body to do in such a case? The poor boy have got no fathers, and I 'm nobody but a lone widow, which it seem a'most right hard as young a female as I am should be left in them conditions; and not only will not her own and ownlest son let her keep peace and friendship with neighbors that he know, as well as he know his name is Jeems Sanky, his father always set store by as friends and good neighbors, which it could be did 't was n't for that boy; and which if ever a boy did miss a person that were strong enough to manage him, it were Jeems Sanky sence he be'n feelin' like he were his own man."

Then she wept, and she did so with such good taste that Mr. Roach was obliged to say that of course boys would be boys, and he had no doubt that as Jim got older, as he must do in the course of time, more or less, he would be another sort of a boy altogether.

"I 'm afraid not, Mr. Roach," she answered candidly. "I have talked and pleaded with that boy, and once I took down the hickory, but he looked at me so much like a pitiful orphan, that I had n't the heart. Yit, yit," taking down her handkerchief, and looking at her visitor with moistest, saddest eyes, "I has faith that the promises will not be without effect to the widow, and that the good Lord will provide for her somehow as may seemeth him meet. Have anybody asked you to help us out with our new meetin'-house, Mr. Roach?"

When Mr. Roach, not without some embarrassment, told what he had agreed to do in these premises, she seemed disappointed, and said:

"Pheriby Harrell! I would n't have treated her that way. She know I had you down on my paper as my favorite name whensomever I could catch up with you accidental, and a-living the closetest to you at that. But I s'pose Pheriby know she could git more out o' you than I could, and of course the meetin'-house want all it can git."

"It were her pa that name it first to me, Missis Sanky."

"Ah! then that 's deffer'nt. And as for Brer Harrell, he know he might have put up that buildin' by his lone self, er at leastways give that last fifty dollars which he squeezed out o' you. But Brer Harrell, good man as he is, he were always one to push up t' other people and hold back hisself to make up the last—if they was any last to make up, and which sometimes they ain't. Why, Mr. Roach, don't I remember when it come to movin' poor Patsy Daniel and her orphan childern 'way over into Jasper County, whar her old aunt sent words that if the neighbors would make up and send her thar, she 'd settle 'em on a

piece o' her land, and Brer Harrell he tuck it in hand, and he went round in his 'flicted way he have in sech times, a-sayin' to people it were cheaper to palm 'em all off that way on that old 'oman, than have to keep 'em here and support 'em, and he actuil' got ten dollars out o' Mr. Sanky and the lendin' o' our kyart and steers for one blessed, solid week, and me a-scolidin' about it all the time, and come to find out that Brer Harrell his very self did n't give but three dollars and seventy-five cent, which it lack jes that much to make up; and then he git out by sayin' that Pheriby and her husband have been so much expense to him he can't afford more 'n to go round and raise money from people and charge for his time! People say if Brer Harrell had put up a'cordin' to his prop'ty, the meetin'-house would have been up by now, and the worship in it done begun a'cordin' to the commandment. And nobody know how much he 's a-goin' to put up, and they won't know now, special' sence you 've put up the last fifty dollars, and they ain't nothin' left but shingles; because why, Brer Harrell have appointed hisself his own committee, and he have got everythin' in his own hands."

"The old man look very feeble, Missis Sanky, and he acknowledge that he ain't much time left to go on."

Mrs. Sanky laughed.

"Ah, Mr. Roach, that ain't no sign, nor it don't mean anythin' here nor there. I used to think it did, when I 've heard him acknowledge the same time and time again, special' when he want people to do somethin', and when they done done it, next time you see him, more 'n probable, you 'll hear him braggin' about his father a-livin' to ninety, and him only thes seb'nty his last birthday, or sixty-nine, or seb'nty-one, as the case might be. That 's Brer Harrell, a notwithstandin' he 's a righteous good man, and he expect to be deac'n o' our new meetin'-house, which somehow the brothrin and sisters would n't make him deac'n over there in Dukesborough; but which he say his time ain't come yit, but it 's a-comin'. If ever Brer Harrell *do* die, and which poor Mr. Sanky used to laugh and say he doubted it, but Pheriby will change things over there, onlest he tie her up in his will, which he threaten to do sometimes when Pheriby buy things he think is too fine, but which poor Mr. Sanky used to say Brer Harrell ought to be 'shamed of hisself for holdin' back his own-lest child in that unuseless way. But it all go to show that no person can have everythin' to their likes nor dislikes, as I know by my own expeunce by Jeems Sanky that he, a-havin' of no fathers, will keep on pesterin' the best neighbors any lone and lonesome widow ever did have in a world where it seem to me everybody have

friends exceptin' of widows; but I am thankful to say that I have been able to lay up some money, and I am willin' to pay for all the damage of Jeems Sanky for this one time; but I shall tell Jeems Sanky plain that hereafter the law must take its courses, alsobeit that I can't but be sorry that the poor boy have no fathers."

Mr. Roach, while drawing a long, sympathetic breath preparatory to his reply to these words, was thus intercepted:

"And if you won't let me pay you, Mr. Roach, which there 's the money in sideboard drawer, please you let the cotton that Jeems Sanky and his hounds have knocked out go on my paper for the meetin'-house, so I may n't be disap-p'inted complete, out and out."

"I never felt like I were so complete overtook, not endurin' o' my whole lifetime," Mr. Roach afterwards used to say. A feeling even rather majestic came over him as he answered:

"Missis Sanky, I shall not take the money you be'n a-layin' up, which I am thankful to hear of it. And, madam, jes to show you what sort a man I am, I will make it my business to have got out the shingles for the aforesaid meetin'-house and no questions asked. That is me, if I understand myself."

"O Mr. Roach! *Mister* Roach!"

But a prudent, bashful widow like Mrs. Sanky would rather have died, she thought, than to go very far beyond the length of these words.

"You say," asked Mr. Roach, with some sternness, "that you think the old man Har-r'll's healths is better than what he call for?"

For a lady almost entirely in black, with an only son who having no fathers was such a varlet, Mrs. Sanky laughed with surprising heartiness. Then she said:

"Why, laws o' me, Mr. Roach! Mr. Sanky used to say that Brer Harrell got his livin' out o' his complainin's about his healths, and it were to his opinions that he 'd outlive *him* and many another person in the neighborhood; and you see how it all come true in poor Mr. Sanky's case, to go no further, although I has heard him say somethin' about Berry Roach as it 'pear like he ruther name you by name."

"No, ma'am," said Mr. Roach, with confident strength, "I should hopes not, not by a long shot; for a person that has the healths I has and no incumbents o' no sort, sech as that would seem like a pity and entire unexpected."

As he rode along home Mr. Roach pondered much. Here was Mrs. Sanky, during her married life a home-staying and, so far as the outside world knew, a few-worded woman, whom people had been wont to call plain, solemn, penurious, and all such, yet now spruce, chatty, not excusing her own son's pernicious practices, not ashamed of having laid up money for hard times and rainy days, and

showing that if you gave her something to laugh about she could laugh as heartily as the best. All this. Then he asked himself how it was that the old man Harrell, at his time of life, should be fooling people about the pretended near approach of death. As for the tying up his property by will in a way that would hinder any husband whom Mrs. Pheriby might elect from getting lawful control of it, he was loath to believe that a man like Mr. Harrell, always a stickler for masculine rights, would ignore them at the last. Still, there was no telling how long some old people could live, and what notions they might take up when old age had made them childish. Mr. Roach concluded that he would think of all these things.

II.

WHEN it was noised abroad that the last fifty of the three hundred dollars needed for the new meeting-house had been subscribed by Mr. Roach, and shingles, people were happy. Passages of Scripture were quoted, and hopes were had that Mr. Roach soon might feel it his duty to walk down into the water and come up out of it a new man. The gentleman himself, extravagant neither in hopes nor in wishes, except in so far as deliverance from Jim Sanky was concerned, indulged the kind of consolation that any honorable man must feel when he has been doing more than his duty. As for Jim Sanky, the cotton was about gathered anyhow, the sheep were removed to another pasture, the hogs would make about as good meat as if they never had been dogged, and the pigeons—well, as for pigeons, they in some respects were not unlike Jim Sanky in going to places where they were not wanted; and so, upon the whole, Mr. Roach believed that he was feeling reasonably contented in his mind, barring an incertitude which, owing to its vagueness, was rather unsatisfactory.

It was surprising to the general public, to the members gratifying, that the new meeting-house went up so rapidly. Mr. Harrell, whose rejuvenility was disgusting to Mr. Roach, had examined every stick of lumber, seen to its kiln-drying, inspected every paper of nails, and, what everybody said he ought not to have done, counted and sighted every shingle. Long before anybody had expected, the building was up, and was named Bethel.

Claiming all the honors of the new Babylon that had been founded, yet Mr. Harrell, in view of the fact that hereafter it might require to be ceiled and painted, saw fit to divide with Mr. Roach the honors of its first opening, which was appointed on a Saturday. The flooring, waiting for shrinkage, had not yet been nailed, and the cracks indulged in unrestricted yawn-

ings. A moderately large congregation assembled, and all occupied the benches except Mr. Swinney, the preacher, Mr. Harrell, and Mr. Roach. The first ascended the pulpit, and the other two were seated in front upon splint-bottom chairs, which Mr. Harrell had provided. Mr. Roach took his seat with becoming solemnity, careful to place the rounds at safe distances between the gapings of the floor beneath. Never having occupied so prominent a place in a house of worship, in spite of some embarrassment he felt a pleasant sense of quietude like what he conceived it might be in heaven, which destination he could not but hope that without much further expense he, in good time, would realize. He had not offered any remonstrance against being put so prominently forth, because he honestly believed himself entitled to the distinction. It was understood that the preacher, during the course of the sermon, would pay his respects to the most liberal and the next most distinguished among the contributors to the pious undertaking; and it was deemed nothing but right that the recipient of such praise should be in position where he could see and be seen by everybody. The hymn was sung, the prayer said, and then the reverend gentleman, taking an apposite text, put forth. Nobody, not even Mr. Harrell, when allusion was made to walls of any kind, whether in the ancient temple of Jerusalem or those around them, could keep his or her eyes off Mr. Roach. The preacher noticed the dissipation, and decided to stop short his hammering upon knotty theological points and rise into the panegyric for which all evidently were impatient. Mr. Roach, aware that this was coming, took out his huge bandana and spread it on his lap in preparation for all embarrassing contingencies.

"Brethren and sisters," said the speaker, "there is a person in this house."

He paused for several moments, looking the while hard at Mr. Roach.

"Yes," he continued, "and I will not name his name, although he is settin' in a cheer alongside o' Brer Harrell, and not a thousand mile from the foot o' this pulpit."

He paused again, and there was almost ferocity in the gaze which he fastened upon Mr. Roach. The latter, for a few moments, steadily returned the speaker's look. Then, as if satisfied that he was the person alluded to, he turned his eyes benignantly upon the congregation, lingering somewhat first upon Mrs. Pheriby, then upon Mrs. Sanky. To make himself entirely comfortable and more presentable to observation, he leaned his chair far back, sat upon its very edge, and extended his legs to their full length, resting his heels firmly in the cracks of the floor. Never before in his life, if his recollection was not at fault, had he felt as sweet.

"A BOY HAVE JOBBED THIS HERE PIN INTO MR. ROACH."

"Yes, brethren and sisters," continued Mr. Swinney; "and the astonishest thing about the whole business is that that same person (and I shall not even name his seck, a-owin' to his presence, which everybody can see for theirself), even ef he ain't a professor o' religion, he have been as lib'l, and he have made hisself a' example to—the good Lord have mercy on us all!"

This ejaculatory finale to the panegyric was not inopportune; for, half a second before its utterance, Mr. Roach, suddenly lifting his right leg, gave a scream, loud, terrific as ever was poured from throat of Indian or of wolf. The women echoed. Mr. Roach rose instantly, clapped a hand beneath his thigh, looked momentarily down through the yawnings of the floor; then, lifting his eyes and surveying the congregation, loudly exclaimed:

"Gentlemen and ladies, I has be'n stobbed; and that d-d-dangnation bad!"

"O my laws!" shouted a hundred female voices. All the men, except the preacher—who, taking a step backward, leaned one eye over the pulpit—and young Mr. Hammick, who had been booked for one of the deacons, crowded around the assailed. The last named rushed out, and peering under the house observed a

pair of legs that just having emerged on the opposite side were making off with all possible speed. Quickly passing around, he saw those legs as they sought a hiding-place behind a huge red oak that stood some fifty yards distant. In his run thither Mr. Hammick picked up a pine stick, to one end of which, with point projecting, had been fastened a stout brass pin. Approaching softly the oak, he reached around to seize the culprit; but the latter, his coat-tails drawn over his head, eluded the grasp and was fleeing again.

"Nobody but Jim Sanky! Oh, you may hide yourself with them coat-tails, but you can't fool me, you serpent! Well! if that were n't a skene in the first openin'. Bethel start herself quare, no doubts about that."

Bringing himself back to proper solemnity, he returned to the house, where the scene had continued interesting. Some young women, in expectation of the sight of streams of blood upon the sacred floor, prepared to faint; and when none appeared they decided to faint notwithstanding. Mr. Roach was overwhelmed with sympathetic questions and dolefully comforting assurances.

"Ef," said Mr. Harrell—"ef you feel your time have come, Berry, my advices is to do

your level best at prayin' to be forgive' for your sins. Them 's my advices."

Looking behind as well as he could, feeling for the murderous gash, finding none, and seeing no blood, Mr. Roach looked up and seemed vaguely vibrating between relief and disappointment. At that moment the young man came in, and, holding aloft the weapon, said aloud:

"A boy have jobbed this here pin into Mr. Roach, and then runned away a-kiverin' his head with his coat-tails so a body could n't see how to sw'ar to him."

What else could he say, when there was the mother among the most cordial sympathizers?

"The varmint!" said Mr. Harrell. "Pears like you got more of a rimnant left than we supposed, Berry; but it's to be hoped you'll take warnin' before it's everlastin' too late."

In the midst of titterings that vainly strove to be repressed the preacher called all to their knees, and, after jerking out some sort of prayer, dismissed the meeting. When the greater part had dispersed, Mr. Hammick, having awaited the opportunity, gave information to Mrs. Sanky of Jim's misconduct.

"I was afraid it was him, Brer Hammick. Please go and tell Mr. Roach I'd like to see him for jes one minute."

"Well, now, Sister Sanky, I ain't quite shore; at leastways for a little while, if I was in your place —"

"Please go and send him here, Brer Hammick."

When Mr. Roach approached her, pale, with tremulous tone, she said:

"Mr. Roach, it were Jeems Sanky that run that pin into you, and if I had my ruthers, I don't know but I'd o' ruther somebody have run a knife into my heart! I see nothin' but for you to pectect yourself and let the law take its course; but I hope you'll tell the judge, and the jury, and the sheriff, and the man that keep the jail, to try to 'member that the poor boy have no fathers, and that they'll all be no harder on him than the law 'll allow. If the poor child have got to be hung, the good Lord know I don't want to live to see it."

"I'm sorry, truly sorry, Missis Sanky," he answered, with unaffected sympathy. "'Pear like I'm sorry for you as I am for myself. In course, I has to try to pectect myself agin Jim, but I shall make it my business to study and try to be leeniwent along o' Jim as I possible can be."

"Thanky! thanky! Poor Mr. Sanky before he died always said you was a good man down at the bottom of your hearts, and now what he say have come true. I can't but hope you'll get your rewards. Good-by, Mr. Roach."

As Mr. Roach turned he was met by Mr. Harrell and Mrs. Pheriby. The former laughingly said:

"I were powerful glad you was skeert a heap worse than you was hurted, Berry. My! my! but did n't you jump and tell the news! But even *me*, I even jumped a little bit; for, says I, who know but me next, a-settin' right thar by you? You did n't know I could jump so, did you? Oh, yes, sence the new meetin'-house been put up I feel like a colt just weaned. But," assuming vast threatenings in his looks, "I should spar' no time nor no money to find out who that boy were that he have the imp'dence to interrup' public worship in that kind a style, and ef his parents did n't let me take his hide off'n him, nor they did n't do it theirsself, I should put the law onto him to the extents she mind to take him for his oudaciousness at a solemcholy time that were. I'm glad it were n't me; but the boy that done that, whomsoever he is, he knowed better than to be a-jobbin' o' pins inter me in that kind o' style. Good-by. Come 'long, Pheriby."

"Mr. Roach," lingering, she said, "I was very much frightened at first, and I am very glad indeed that you was hurt no worse. Good-by. I'm coming, Pa."

The feelings of Mr. Roach during the remainder of that day and night, and for another day and night, he used afterwards to characterize as "prob'le the schupendousest egzitement any man in the whole State o' Georgia ever drapped into for the time a bein'." He pondered and pondered till bedtime, and after that could n't sleep for a long, long time; and when he awoke next morning found that he had been dreaming about pondering all night. Several poor relatives came there the next day, full of apprehension, anger, vengeance. All of them he dismissed as soon as decency would allow, some of them perhaps rather sooner, comforting them with the assurance that in his body, and even in both of his legs, he had never felt better; and then he went to pondering again. His purpose on the forenoon of Saturday had been formed to ride home with Mrs. Pheriby after service, and feel, and allow Mrs. Pheriby to feel, their ways among matters that possibly would be interesting to both; but he had been disgusted with her father's behavior, particularly the deception of which he had been guilty regarding the condition of his health and strength of body. Just as soon as the Bethel business had been made secure here was old man Harrell going about kicking up his heels like a young man. From the number of times that man had seemed to be about to drop right into the grave, then suddenly turning his back upon it and gone to prancing, it did appear that he was destined, if not to be restored to his youth, at least, as poor Mr. Sanky had prophesied, to survive many a man, even Littleberry Roach, now in the full

vigor of manhood. No, sir; no, sir; not to-day, at all events. Mr. Harrell may be a professor, and Littleberry Roach a mere worldling; but Littleberry Roach would n't treat people that way, old nor young. No, sir; no, sir.

But of course the subject on which Mr. Roach had been pondering the most during these

other narrow streak of white, and so to dispose her long hair that it might contribute its own portion of help, however inconsiderable, to the suppliant she was about to become. When the visitor entered the house, received the friendly greeting, looked upon the patient face that sorrow, tasteful gear, and a most abun-

THE PROPOSAL.

two days and nights was the pressing need of his being protected against Jim Sanky. That boy had to be dealt with in a summary way that would stop his destructive practices. Still he was the son of a widow, and she had acted so honorably throughout, that he believed that, as a man, a neighbor, and a friend, he should give her notice of his intention, so that her scapegrace, if so minded, might abscond. How best to do this was not perfectly clear to his mind, but it was a thing that could not be delayed, he felt; and so on Monday morning, in a state of some incertitude, he dressed himself uncommonly well for a week-day, and mounted his horse. As he rode along the lane between a fine field of cotton on one side and one of corn as good on the other, in the midst of other thoughts he, in brief parentheses, contemplated how the widow Sanky, who was a better manager than her late husband had been, was making tell the work she was putting on that rather small but excellent plantation.

Mrs. Sanky, made aware of his slow, apparently thoughtful approach, downcast as she was in heart, felt it not entirely amiss to add an-

dant, well-arranged suit of hair made strikingly interesting, after a few moments, turning his eyes, he surveyed some bright, new furniture, which had been received there since his last visit, a month ago.

"Nice," he said; "all very nice."

"I'm glad you think so," answered the lady; then sighed, with great heaviness.

Mr. Roach, startled, said, or tried to say:

"Law bless my — Missis Sanky! I — I can't do anything — in this case a — along o' Jim."

"Oh, can't you, Mr. Roach? Bless your dear — there now! I no business a-usin' that word; but — I forgot myself at the minute." And how she did blush!

"As for puttin' the law onto Jim, like the neighbors advises, I hain't the hearts to do it. And yit, Missis Sanky, a man in my sitioation o' life he owe it to himself to perpect hisself ef he can."

"Of course he do, Mr. Roach; of course."

"I has took in consideration that, as I've freckwent heered you say with your own mouth, that Jim Sanky have no fathers, at least for the present time a bein'; and I goes on to say

that fathers, or at leastways some of 'em, is what Jim Sanky need, ef any can be found suitable to riggerlate him. Ahem, madam!"

Mrs. Sanky stared up at him, who was now standing, as if he were a ghost; and if not a very awful, at least a very tall one, at that.

"Yes, madam, Missis Sanky, them is who Jim Sanky need, and if it's your consents and your wishes, I 'm willin' to be them very them, and only them tell death shall me and you do part."

He had heard somewhere that when a man was discussing with a woman a subject of importance it assisted much to use words of solemn import.

As it was inconvenient to faint with satisfaction in a sitting position, Mrs. Sanky arose, tottered, looked weakly at Mr. Roach, fell into his arms, and after remaining there a few minutes said beseechingly:

"O Mr. Roach! dear Mr. Roach! do, please, let me loose!"

He did so promptly; and when she resumed her seat she said, "Mr. Roach, *Mister* Roach, I thought all this time—upon my soul, I thought it was Pheriby."

If he was embarrassed by this remark he determined not to seem so. Smiling in a pleasant disdain, he was silent for a few moments, then said:

"Ah, ha! I knewed it! Polly,—as I will call you in a' affectionate way,—does you 'member a-tellin' me what—what cert'n people said in their lifetime about old man Har'll, and him a-outlivin' cert'n various people? Well, I found out that that is a constant a-comin' true; people of various age a-dyin' and a-droppin' off on all side, and him a-frol-ickin' around, and a-callin' hisself a colt and that not even broke, but jes weaned! No, madam; old man Har'll may 'pose on t' other people, but not on Berry Roach. I ain't a-denyin' that he got out o' me fifty dollars when he make out like he were on his last laigs; but any man is liable to sech as that when he think it's a' old person's dyin' hour. No, Polly," taking her hand, "you hit me a toler'ble sizable lick that day when I come over to see you about Jim, and you had on that same cape you got on now, and I smelt your hankercher, and you talk so fa'r and squar' about Jim, and I has already begun to feel lonesome thar at home by myself, and all that sot me to thinkin'. And but now, last Sadday, after all that rumpus, and you sent for me, and me not a even-a-dreamin' who it were jobbed my laig with that pin, and the very boy's very mother told me herself who it were, and I see you was yit fa'r'er and squarer, and which I 'll not deny that I have notussed that cape and them white ruffles round your wrists, a-lookin' like they would if they could, modest as they was, and you drewed out your Sunday hankercher

which I could smell it out thar in the very ar, and it make me feel solemn and good all over in great big spots, ontwell as I rid on back home I says to myself, what Jim Sanky need for me to perfect myself agin him is *fathers*; and then, when that have got stuck fa'r and squar' in my mind, I jes had to add on to myself that I 'd be them fathers myself ef so be it's the good Lord's will and the boy's mother's to boot. Now that is every single blessed thing they is in it."

Tears came to Mrs. Sanky's eyes, and nothing could have been sweeter to the nostrils of Mr. Roach than the perfume of the handkerchief with which she dried them so pitifully. A woman of delicate feelings would not be willing for it to be understood that she could be won so suddenly, as it appeared, by even such a man as Mr. Littleberry Roach, and so she said:

"Berry, up to the time when you come over here about Jeems a-knockin' out your cotton with his hounds, and a-skearin' of your sheep in the pastur', and a-doggin' your hogs in the low grounds, my mind have never not even *dwelt* on any man person since the widow I 've been. But somehow, on that present occasion, when you have come over here, a actuil' *dreaned* o' fifty dollars by Brer Harrell, and Pheriby to boot, and instid of takin' damages for Jeems and his hounds, you put down and added the actuil shingles for our meetin'-house, then I says to myself, as a dilicate female is obleeged to say to herself, alsobe she may n't be nothin' but a lone widow, but yit I says to myself, my hopes is, Berry Roach will never ask me to jind him in the banes o' mattermony; cause *if* he do, I shall be obleeged to give my consents. Oh, me! but I hope them words—Berry, I do hope they excuse me on the awful occasion!"

"Umph, humph! Yes; I 'm glad to hear it. 'Pears like we was ruther nunanimous on them p'int. Whar 's Jim, Polly?"

"Jeems he got uneasy in his mind, and he have went across the river to Cousin Sookey Brazzle's."

"Umph, humph! Well, Polly, I 'm a-gwine on to town; and by as yearly in the atternoon as I can 'tend to the business and git back I shall be here, and I shall fetch the married license, and I shall fetch along also other Squire Buck Peek, or the old man Swinney, whichever you may perfers, ef it ain't too ill-conwenant."

"*Mister* Roach!"

"You heerd me what I said."

"You are so hasty and—and I may say, perfect, actuil' vi'lent."

"Mayby so, mayby so; but a man at my time o' life that he have been a-waitin' this long, he don't feel like he ought natchul' to be made wait no longer. Which do you say, Buck Peek, or the old man Swinney?"

"Why, Brer Swinney in course, if—if it ain't too inconvenient. Berry Roach, you actuil' astonish me, and you mighty nigh take away a body's breath with your hurry and—vi'lence, I call it. Go 'long off!"

It was a union happy for all. Mr. Roach used with a thankful heart to refer to these last scenes.

"Yes, sir; yes, sir; when my mind were made up, she were made up. Polly she said I were vi'lent, same as a harrikane, and mayby I were. But you see, a-lettin' alone o' that cape, and that smellin' hankercher, and that ha'r, the sleekest and the mostest I ever see hung on top o' a female head, and then thar were Jim, which I have knowed I were jes obleeged to perpect myself somehow agin Jim Sanky, and it come on me all of a suddent that the best

way to do that were to git possessions of his mother. And when Jim come back from his cousin Sookey Brazzle's and found me thar at the head o' things, it cowed him to that, that as everybody know, he whirled in and he made a man o' hisself; nor not even his mother is prouder than what I am o' Jeems Sanky. And it all go to show that not ontwell a man's time come to git married he a-gwine to do it; but when the time do come, he may wring and twist and squirm, but he 's jes as certain as a shot is to roll out a shovel when she 's tilted. And as for me, when I come back thar that evenin' along o' Buck Peek, and Polly were lookin' beautifuller and gorgerouser than I ever see her befo', I felt that good and peaceable in my mind that I were glad I never got married befo'; dad-fetchit, if I did n't."

Richard Malcolm Johnston.

THE SUN-DANCE OF THE SIOUX.

GOING TO THE DANCE.

A FEW years ago it was the good fortune of the writer to witness, at the Spotted Tail Indian Agency, on Beaver Creek, Nebraska, the ceremony of the great sun-dance of the Sioux. Perhaps eight thousand Brulé Sioux were quartered at the agency at that time, and

about forty miles to the west, near the head of the White River, there was another reservation of Sioux, numbering probably a thousand or fifteen hundred less. Ordinarily each tribe or reservation has its own celebration of the sun-dance; but owing to the nearness of these two

agencies it was this year thought best to join forces and celebrate the savage rites with unwonted splendor and barbarity. Nearly half way between the reservations the two forks of the Chadron (or Shadron) creek form a wide plain, which was chosen as the site of the great sun-dance.

In general it is almost impossible for a white man to gain permission to view this ceremony in all its details; but I had in Spotted Tail, the chief, and in Standing Elk, the head warrior, two very warm friends, and their promise that I should behold the rites in part slowly widened and allowed me to obtain full view of the entire proceedings.

It was in June that the celebration was to be held, and for many days before the first ceremonies took place the children of the prairies began to assemble, not only from the two agencies most interested, but from many distant bands of Sioux to which rumors of the importance of this meeting had gone. Everywhere upon the plains were picturesque little caravans moving towards the level stretch between the branches of the Chadron—ponies dragging the lodge-poles of the tepees, with roughly constructed willow baskets hanging from the poles and filled with a confusion of pots and puppies, babies and drums, scalps and kindling-wood and rolls of jerked buffalo meat, with old hags urging on the ponies, and gay young warriors riding. Fully twenty thousand Sioux were present, the half-breeds and the "squaw-men" of the two agencies said, when the opening day arrived. Probably fifteen thousand would be more correct. It was easier to believe the statement of the Indians that it was the grandest sun-dance within the memory of the oldest warriors; and as I became fully convinced of this assertion, I left no stone unturned that would keep me fast in the good graces of my friends, Spotted Tail and Standing Elk.

When all had assembled and the medicine-men had set the day for the beginning of the great dance dedicated to the sun, the "sun-pole" was selected. A handsome young pine or fir, forty or fifty feet high, with the straightest and most uniformly tapering trunk that could be found within a reasonable distance, was chosen. The selection is always made by some old woman, generally the oldest one in the camp, if there is any way of determining, who leads a number of maidens gaily dressed in the beautiful beaded buckskin gowns they wear on state occasions; the part of the maidens is to strip the tree of its limbs as high as is possible without felling it. Woe to the girl who claims to be a maiden, and joins the procession the old squaw forms, against whose claims any reputable warrior or squaw may publicly pro-

claim. Her punishment is swift and sure, and her degradation more cruel than interesting.

The selection of the tree is the only special feature of the first day's celebration. After it has been stripped of its branches nearly to the top, the brushwood and trees for a considerable distance about it are removed, and it is left standing for the ceremony of the second day.

Long before sunrise the eager participants in the next great step were preparing themselves for the ordeal; and a quarter of an hour before the sun rose above the broken hills of white clay a long line of naked young warriors, in gorgeous war-paint and feathers, with rifles, bows and arrows, and war-lances in hand, faced the east and the sun-pole, which was from five to six hundred yards away. Ordinarily this group of warriors numbers from fifty to possibly two hundred men. An interpreter near me estimated the line I beheld as from a thousand to twelve hundred strong. Not far away, on a high hill overlooking the barbaric scene, was an old warrior, a medicine-man of the tribe, I think, whose solemn duty it was to announce by a shout that could be heard by every one of the expectant throng the exact moment when the tip of the morning sun appeared above the eastern hills. Perfect quiet rested upon the line of young warriors and upon the great throng of savage spectators that blacked the green hills overlooking the arena. Suddenly the old warrior, who had been kneeling on one knee, with his extended palm shading his scraggy eyebrows, arose to his full height, and in a slow, dignified manner waved his blanketed arm above his head. The few warriors who were still unmounted now jumped hurriedly upon their ponies; the broken, wavering line rapidly took on a more regular appearance; and then the old man, who had gathered himself for the great effort, hurled forth a yell that could be heard to the uttermost limits of the great throng. The morning sun had sent its commands to its warriors on earth to charge.

The shout from the hill was reëchoed by the thousand men in the valley; it was caught up by the spectators on the hills as the long line of warriors hurled themselves forward towards the sun-pole, the objective point of every armed and naked savage in the yelling line. As they converged towards it the slower ponies dropped out, and the weaker ones were crushed to the rear. Nearer and nearer they came, the long line becoming massed until it was but a surging crowd of plunging horses and yelling, gesticulating riders. When the leading warriors had reached a point within a hundred yards of the sun-pole, a sharp report of rifles sounded along the line, and a

DRAWN BY FREDENG REMINGTON.

THE CHARGE ON THE SUN-POLE.

ENGRAVED BY J. W. EVANS.

moment later the rushing mass was a sheet of flame, and the rattle of rifle-shots was like the rapid beat of a drum resounding among the hills. Every shot, every arrow, and every lance was directed at the pole, and bark and chips were flying from its sides like shavings from the rotary bit of a planer. When every bullet had been discharged, and every arrow and lance had been hurled, the riders crowded around the pole and shouted as only excited savages can shout.

Had it fallen in this onslaught, another pole would have been chosen and another morning devoted to this performance. Though this seldom happens, it was thought that the numerous assailants of this pole might bring it to the ground. They did not, however, although it looked like a ragged scarecrow, with chips and bark hanging from its mutilated sides.

That such a vast, tumultuous throng could escape accident in all that wild charging, firing of shots, hurling of lances and arrows, and great excitement would be bordering on a miracle, and no miracle happened. One of the great warriors was trampled upon in the charge and died late that evening, and another Indian was shot. The bruises, sprains, and cuts that might have been spoken of in lesser affairs were here unnoticed, and nothing was heard of them.

Later in the day the sun-pole was cut down and taken to the center of the great plain between the two forks of the Chadron, about a mile away. Here a slight excavation was made, and into it the butt of the sun-pole was put, and the tree, the bushy top having now disappeared, was held upright by a number of ropes made of buffalo thongs diverging from its top. At their outer ends, probably from seventy to eighty feet away from the sun-pole, they were fastened to the tops of stakes seven or eight feet in length. These, with a large number of stakes of similar size driven in close together, formed a circular cordon around the sun-pole, and over these stakes were stretched elk-skins and buffalo-ropes, canvas and blankets, and a wattling of willows and brush. Sometimes canvas, blankets, and light elk-skins are thrown over the supporting ropes to ward off in a slight way the fierce rays of the noonday sun. To one approaching by the road that led over the winding hills which hem in the broad plain between the two forks of the Chadron the affair looked not unlike a circus tent, the top of which has been ruthlessly torn away by a cyclone.

All day, from the closing of the ceremony of shooting at the sun-pole, the attention of the Indians was occupied in constructing this inclosure, where, within a day or two after its completion, they performed those barbarous

rites and ceremonies of cruelty and self-torture that have placed the sun-dance of the Sioux on a level with the barbarisms of any of the far more famed devotees of Juggernaut.

Early on the morning of the third or fourth day the true worship of the sun, if it can be strictly so called, was begun. So far all that that luminary had done was to signal the charge of the young warriors on the sun-pole. It now entered into the calculation of every minute, almost of every second, of the barbarous proceedings. Those who were to torture themselves, probably forty or fifty in a sun-dance of this size, were, as near as I could judge, young warriors from twenty to twenty-five years of age, all of them the very finest specimens of savage manhood in the great tribe.

I was told that these fine fellows fast for a number of days before they go through the self-torture, one informant saying that before the ordeal takes place it is required of them to abstain from food for seven days and from water for two. While their condition did not indicate such abstemiousness as this, I think it true that some fasting precedes the more barbarous ceremonies.

The third day was mostly consumed in dancing and in exercises that did not vary greatly from the dances and exercises usually seen at any time in large Indian villages. On this day, however, the sun-dance began. Within the arena were from six to twelve young warriors, still in war-costume of paint and feathers, standing in a row, and always facing the sun, however brightly it shone in their eyes; with fists clenched across the breast, like a foot racer in a contest of speed, they jumped up and down in measured leaps to the monotonous beating of the tom-toms and the accompanying yi-yi-yi-yis of the assembled throng. The dancers occasionally vary the proceedings with savage music or with whistles made of bone. Now and then a similar row of young maidens would appear in another part of the arena, and their soprano voices would break in pleasantly on the harsher voices of the men. The dancing continued for intervals of from ten minutes to a quarter of an hour, broken by rests of about equal length, and lasted from sunrise to sunset.

Many trifling ceremonies took place while the important ones were proceeding. Horses and ponies were brought into the arena, and the medicine-men, with incantations, dipped their hands into colored earth and besmeared the sides of the animals with it. As these animals were evidently the best war-ponies, the ceremony was doubtless a blessing or a consecration to war.

On the fourth day of the Chadron sun-dance the self-torture began, and I was told that those who were to submit themselves to the great

MAKING MEDICINE-PONIES.

ordeal were the same young warriors who had been dancing the day before. Those who began the dance on the fourth day took the final ordeal on the fifth, and so for four or five days the dancers of one day became the sufferers of the tortures of the next.

The row of dancers took their places promptly at sunrise, but it was not before nine or ten that the tortures began.

Then each one of the young men presented himself to a medicine-man, who took between his thumb and forefinger a fold of the loose skin of the breast, about half way between the nipple and the collar-bone, lifted it as high as possible, and then ran a very narrow-bladed but sharp knife through the skin underneath the hand. In the aperture thus made, and before the knife was withdrawn, a stronger skewer of bone, about the size of a carpenter's pencil, was inserted. Then the knife-blade was taken out, and over the projections of this skewer, back-

wards and forwards, alternately right and left, was thrown a figure-of-eight noose with a strong thong of dressed skin. This was tied to a long skin rope fastened, at its other extremity, to the top of the sun-pole in the center of the arena. Both breasts are similarly punctured, the thongs from each converging and joining the rope which hangs from the pole. The whole object of the devotee is to break loose from these fetters. To liberate himself he must tear the skewers through the skin, a horrible task that even with the most resolute may require many hours of torture. His first attempts are very easy, and seem intended to get him used to the horrible pain he must yet endure before he breaks loose from the thongs. As he increases his efforts his shouts increase, huge drops of perspiration pour down his greasy, painted skin, and every muscle stands out on his body in tortuous ridges, his swaying frame, as he throws his whole weight wildly against the

FACING THE SETTING SUN.

fearful fetters, being convulsed with shudders. All the while the beating of the tom-toms and the wild, weird chanting of the singers near him continue. The wonderful strength and extensibility of the human skin is most forcibly and fearfully displayed in the strong struggles of the quivering victims. I have seen these bloody pieces of bone stretched to such a length from the devotee that his outstretched arms in front of him would barely allow his fingers to touch them.

I know it is not pleasant to dwell long upon this cruel spectacle. Generally in two or three hours the victim is free, but there are many cases where double and even triple that time is required. Oftentimes there are half a dozen swinging wildly from the pole, running towards it and then moving backwards with the swiftness of a war-horse and the fierceness of a lion in their attempts to tear the accursed skewers from their wounded flesh. Occasion-

ally some over-ambitious youth will erect four stakes within the arena, and fastening skewers to both breasts and to both shoulders will throw himself backwards and forwards against the four ropes that hold the skewers to the stakes.

Faintings are not uncommon even among these sturdy savages; but no forfeit, opprobrium, censure, or loss of respect in any way seems to follow. The victim is cut loose and placed on the floor of some lodge near by and left in charge of his nurses. The only attempt I saw to break loose from double skewers in front and behind terminated in this manner. Whether the men ever afterwards enter the cruel contest after having thus failed I do not know. It may be possible that some exceedingly ambitious warrior may enter the lists year after year to show his prowess, but I understand that it is supposed to be done but once in a lifetime. It is not obligatory, and by far

the greater number grow up sensibly abstaining from such savage luxuries. When the day is almost over, and the solar deity is nearly down in the west, the self-tortured warriors file from the inclosed arena, one by one, and just outside the doors, deeply covered with handsomely painted buffalo-robcs, they kneel, and with arms crossed over their bloody breasts and with bowed heads face the setting sun and rise only when it has disappeared.

Many other horrible variations have been reported to me; such as tying a saddle or a buffalo's skull to the end of the long rope fastened to the skewer and running over the prairie and through the timber, the saddle or skull bounding after the victim until he liberates himself; or, when fainting, to draw the tortured man clear of the ground by the ropes until his weight overcame the strength of the distended skin. My informants told me that no two of the ceremonies were alike, the self-torture in some form being the one common link in all. The consecration of the sun-pole, much of the dancing and singing, the double efforts of ambitious youths, and other ceremonies might be left out entirely or others substituted. I describe it only as I saw it. I will add that this sun-dance was called the greatest the Sioux had ever held; the greatest self-sacrifice of the greatest native nation within our boundaries. Within a year they had checked, at the Rosebud Hills in Montana, the largest army we had ever launched against the American Indians in a single fight; had retired successfully to the Little Big Horn, a few miles away, and there, a week later, had wiped Custer's fine command from the face of the earth; had held Reno for two days upon a hill; had

HERALDING THE SUNRISE.

never lost a battle worthy of the name in the war which led to their subjugation; and had proved the utter worthlessness of victory to a savage race contending against civilization.

Frederick Schwatka.

THE DESERTED CITY.

THERE lies a little city leagues away.
 Its wharves the green sea washes all day long.
 Its busy, sun-bright wharves with sailors' song
 And clamor of trade ring loud the livelong day.
 Into the happy harbor hastening, gay
 With press of snowy canvas, tall ships throng.
 The peopled streets to blithe-eyed Peace belong,
 Glad housed beneath these crowding roofs of gray.

'T was long ago this city prospered so,—
 For yesterday a woman died therein;
 Since when the wharves are idle fallen, I know,
 And in the streets is hushed the pleasant din;
 The thronging ships have been, the songs have been;
 Since yesterday it is so long ago!

Charles G. D. Roberts.

THE LAST MARCHBANKS.

“T F” YOU will just step over there to Miss Addington’s desk she will talk with you, madam,” I heard the managing editor say in tones a little more gentle than were usual to him.

I looked up from my half-finished sentence and saw coming towards me, as if propelled by the wave of the editorial hand, a little, shabby, dainty, delicate old lady. She was dressed in black, and her white with-

ered face was charmingly pretty in those fundamental lines upon which time has least effect.

Resentment swelled within me. The managing editor always put it off on me to deal with the piteous feminine non-competents continually trickling in and out of the office.

“I’m afraid I’m taking up your time, when you are very busy,” said the lady, with a gracious little “society” manner, in which, nevertheless, a tremor of timidity and anxiety was all too evident.

Lo, she was a Southerner; there was no mistaking that gentle drawl on the vowels and suppression of the consonants. I shall not try to reproduce the peculiarity of her speech; the written letters cannot convey what it was, except as you know it already, and they seem to coarsen it.

She had a manuscript with her that she hoped might be adapted to the columns of the “Evening Appeal”; she always enjoyed the “Appeal” so very much.

Her manuscript was devoted to picturing details of life on a Southern plantation in the autumn. She had tried to make it timely; she had heard that that was desirable for daily papers. It was not about the far South, but told of things as they might be in Tennessee or Kentucky, the sorghum pressing, and sweet-potato digging, and hog-killing —

“Oh, I know it all so well,” I broke forth.

“You, do you? Why, my dear child, are you from the South?”

How can I tell you all she put into those words?— the glad recognition of a matter-of-course friend and ally; the faint, half-tender reproach that I was so demoralized that she did not know me at once for a compatriot; and the surprise at finding a Southern girl there in that office, surrounded by men, and working away as one of them.

She who had shown no consciousness of anything anomalous in my position before now glanced about the ugly place, even at the up-turned desk drawer I was using for a footstool, and put out a little, crooked old hand to pat me pityingly and reassuringly.

When she found I was from Tennessee, and that my name was Addington, we were straight-way launched on a tide of interchange and reminiscence.

I was not surprised to find we knew all about each other’s families: I had dimly supposed we did when I heard her speak. All Southerners do know, or know of, all the rest, and I had been given of late years rather to escaping than seeking those kindly intimacies they establish as a matter of course when they meet away from home. The exigencies of life had forced me to appreciate them more in the abstract than the concrete.

But only a brute could have withheld a cordial response from this little gentlewoman, and moreover her name stood for a good deal to my imagination. It was, she told me, Fanny Marchbanks Overman.

I suppose she had been Mrs. Overman nearly forty years; but, being a Southerner, she was still to herself and her friends Fanny Marchbanks as well.

The Marchbanks part was what interested me. My grandfather’s most intimate friend, and his partner for many years, had been Judge Marchbanks; and even in my half-foreign bringing up I had learned the traditions of that stout old Whig’s loyalty and shrewdness and eccentricity. I had heard too of his daughter; had heard of her as the brilliant young belle who had been my mother’s childish ideal of beauty; and now, after all these years and generations and upheavals, here were Fanny Marchbanks and I meeting in the office of the New York “Evening Appeal,” and she was a poor old woman wanting to sell an unmarketable manuscript.

That manuscript — the thought of it fell upon me like a pall. The worst was her confidence

in me, in my acceptance of it; I had been stealing glances at it while she told me what a "polished gentleman" my grandfather was, and how smooth my mother wore her hair when she was a little girl.

I saw it would be as much as my position was worth to hand it to the managing editor.

I asked her if she had been doing much writing in New York.

Yes, she had been writing here for a year and a half. She had written some stories for one of the dying, old fashion magazines; she had had a Southern sketch in a good weekly;

Senator Lawton, don't you? Then why can't you take this paper and fix it all up as happening on Senator Lawton's place—you've been there? You can easily make it accurate then. You see that if you can make it fit in with something that is going on, that the papers are full of just now, it will go; it is hardly enough to make it simply about the present season, though that is well; but if you show what the Lawtons' home is like, I am sure you can sell it to 'The Earth,' and they will pay you better than this paper will."

She looked pitifully dubious. "You don't

"SHE WILL TALK WITH YOU, MADAM."

she had sent some letters to her Church paper in the South; she had even had some negro anecdotes published in one of the "comic" journals!

I could guess what that dear, simple, girl-like old thing had gone through; the struggle and the poverty and the heart-straining anxiety it had cost to achieve this much. Now she wanted to do more: she wanted to get into other lines of writing, and she thought there must be a great field in the daily papers; and she looked up at me with the light of hope and the waver of fear in her faded, pretty old eyes.

A bright thought came to save me from despair—if only she could be made to share it. A Tennessee senator had just made some kind of sensation in Congress. I said: "You know

think it would be infringing on the laws of hospitality?" she said.

"You don't need to be personal and Jenkinsy," I hastened to assure her; "and you might write to Colonel Lawton for permission to tell about his sorghum presses."

She smiled in a relieved, reassured way. She listened with deep attention to all I had to say. She had a wonderful adaptability; she caught a new idea as to what was wanted in a way that was highly encouraging.

"I know what you mean," she said, "about the new, curt, quick way of writing. I have noticed it in the papers, only I thought perhaps it was because they could n't write any other way. But I can try to do it too, if that is what they like up here in the North. And I'll tell

anything about the Lawton place that seems unobjectionable. I'm glad you think he won't dislike it. And now, my dear, I'll take myself away. I'm sure you are giving me far too much time; but you can just tell them, my child, that you don't see any one every day up here who knows all about you for three generations. Dear, dear, it does seem too bad to leave you here all by yourself so, and you so young. What would your grandfather th— But then your grandfather would be very proud of your talents, Adelene, and he was a man who knew that we have to adapt ourselves to circumstances; and I'm sure these—gentlemen all seem very—very inoffensive." And she overlooked the hard-working, scribbling crowd bent over their desks.

Softly fluttering over me in this fashion to the very elevator door, she finally took her leave.

I soon learned what seemed all the main facts of her little story; her great, tragic human story, filled, as everybody's story is, with experiences at once terrible and commonplace.

She had been left a widow, with two little children, while still a young woman; the children, boys, had both died only a few years later, and she had spent most of her life as a childless widow in her widowed father's house. She was his only child. He had died near the beginning of the war; most of their property had been lost. Mrs. Overman had since then made what shift she could; and now, in her old age, with a courage that had root in inborn gallantry of soul, and also in ignorance of this rough world, she had come to this strange land "the North" to try to make her living by writing.

How foreign and far away this part of our common country seemed to her probably only a Southerner could realize. Fundamental ideas affect many ramifications of feeling as well as thought, and the weakness of the idea of nationality at the South sharpens many a homesick pang in many a traveler and exile who would not understand the phrase.

That Mrs. Overman succeeded as well as she did was a continual marvel to me. There was a dauntlessness about the frail, delicate, lady-bred old woman that made me proud of the civilization—if you will permit the word—that had produced her.

I sympathize with the point of view that finds Southern aristocratic pretensions humorous; they certainly had far less basis of material splendor than the simple-minded aristocrats themselves imagined: and I doubt not that there is and will be in the future something better in this world than any kind of aristocracy; but for the blessings of a commercial democracy we pay a good deal, and my provincial little old woman exemplified the

high-hearted virtues of the old régime in her union of fine pride, courage, cheerfulness, and gentleness as nobly as if her claims to blue blood were based on something more imposing than an ancestry of two or three generations of backwoods dignitaries; the obligations of an aristocracy were strong upon her.

I a little dreaded visiting her in her boarding-house. I thought I knew what it would be like, and I felt that it would be rather wretched to see her in the midst of its cheap frivolities and poor pretensions; but I found she had discovered for herself a place very different from my imagination—not vulgar, though offering hardships enough to such a one as Miss Fanny, as we must now in common friendliness begin to call her.

"It is a woman's boarding-house, dear; a business woman's house," she explained to me as we sat side by side on an immense hair-cloth sofa in the clean, mournful, self-respecting parlor.

"Miss Mary Barnwell told me about it before I came on here. You never saw Miss Mary, did you? Your mother knew her; she is a lovely woman; she was Timothy Barnwell's daughter, that endowed the college in Wexville, and Miss Mary teaches there; she comes on to New York in the summer sometimes, and she stops here. It made me feel so much more at home to come to a place I'd heard Mary tell about, and I think it is very sheltered and protected to be in a house without gentlemen—when one is quite alone so."

It was a big, old-fashioned house, and the large rooms were divided up into small ones by wooden partitions; these were long and narrow sections of the original apartment, and each contained two little iron bedsteads. The inhabitants of the business woman's boarding-house were united as room-mates without reference to anything but a rigidly inspected respectability all around (surely none but the most respectable of women ever wanted to live there), but each was given a bed to herself.

Miss Fanny found it a little painful to explain these things to me, and a faint red spot came in each withered, delicate old cheek as she said: "It seems a little like what they call an institution up here, does n't it? But it is n't. The landlady is a New England woman; her name is Martin, and you see she has planned to have the cheapest place that—that—a nice person can live in; and you see it is n't so bad, for it is clean, and it is quite comfortable, I assure you; and you know you are sure that your room-mate is respectable, and everything is arranged for it, so you have a great deal more privacy than you would think. I must take you to my room," she went

on, "to show you my father's portrait. Oh, yes, I always have that with me; and you must be able to say you know how Judge Marchbanks looked."

"Of course," she said, on the stairs, "these Northerners are very strange. The lady I am with is named Miss Boggs. You'd think she was—well, rather a common sort of person, from very plain people, you know, on first meeting her; but she is very highly educated; she is studying medicine. She has n't the polish one finds in our people, but I am sure she has a very fine character, and she is religious, and—and settled in her views; not in the least like we used to be apt to imagine at the South."

She was interrupted by arriving at her door. Miss Boggs was not in. Looking very large, upon the walls of the cell-like little place, hung the portrait in its dingy gilt frame,—you know the kind,—the clothing like solidified smoke, the linen as if molded out of vapor, and the flesh suggesting painted wood; yet the creature who painted it had not succeeded in evading his subject altogether, ample as were his incapacities, and something of the man, the large-minded, able, romantic man that I had heard of, was in it. I even thought I could see in it qualities I already knew in Miss Fanny, especially the receptivity, the openness to new ideas that made her seem so young, and made it possible for her to wage such battle as she had entered upon.

I could imagine, as I looked at the picture, that the Judge, if put down alive in the queer room, would make some sort of intelligent effort to comprehend the conditions around him.

Miss Fanny flecked at the frame with her pocket-handkerchief, she carried me to one side and the other to see the picture, and she impressively told me the name of the poor soul who painted it. Then she sat herself down in front of it, and told me about the Polk and Clay campaign in which Judge March-

"MISS FANNY FLECKED AT THE FRAME WITH HER HANDKERCHIEF."

banks and my grandfather had "stumped" the State together—trying politely but fruitlessly to remember as many instances of triumph and adulation for my ancestor as for hers. That both gentlemen were on the losing side in that contest had never occurred to her as dimming their honors.

I always remember her as she looked that day, like some quaint little priestess before a shrine. She sat in a chair close against the wall, that in the narrow room she might be able to see the picture opposite; her white hair was crimped a little and drawn softly back in a very good compromise between old styles and new,—Miss Fanny was not the person to cling to the old for its own sake,—and at her wrists and neck were, of all things, bits of "thread" lace. Her figure was girlish

rather than otherwise, and pretty too, with its nice flat back; but the old black gown was skimpy and shabby, and that made me sorry, because I knew the little woman was not and never would be indifferent to her dress. As she talked away so proudly, so feelingly of "my father," I wondered what place in memory had all the rest of her long past; the wifehood and widowhood and motherhood, the common, blessed warm joys, and common, crushing griefs that fate had bestowed upon her, and which, good and ill alike, she—so little and tender still—had survived. All seemed to have sunk out of sight, to be buried, and only the first ties to be still active and operative despite time and death. I reflected that after all she had spent most of her life with her father, that it was as his daughter she had chiefly found her title to existence, but I did not know at that time the thing that really explained her special devotion to him—the fact that she was then spending herself in his service, for his good name. The filial tie was reënforced now by one yet stronger, by perhaps the firmest of human bonds, that which binds the server to the served, and at last something like a mother's love mingled with the daughter's loyal adoration of the long-dead man.

I staid to dinner with her—supper she called it, and in fact the bald little meal might as well be termed the one as the other; but she was unapologetically hospitable and graceful over it.

It was not till I came to go home that Miss Fanny's adaptability failed her. "O my child, I cannot let you go out into the street alone. It is bad enough for me; but you, I can't think of it at all."

"Very well, then, Miss Fanny; I'll ring for a messenger boy."

"What for, dear?"

"To go home with me."

"A messenger boy?"

"Why, yes; that is what we do when we are too proper to go alone."

"Mercy on me! My lamb, it is to save you from messenger boys and their like that I'm going with you myself."

"It is perfectly safe anywhere in this part of the town," volunteered Miss Boggs, a big-boned, dust-colored young woman reading a calf-bound volume at a drop-light.

"Yes, Miss Boggs, I know, I suppose it is, and I think it is lovely to see you Northern girls so strongminded and independent. You could go anywhere; but you see Adelene was not brought up to take care of herself as you were, and I feel a sense of responsibility for her. I ought to be a fairy godmother to her, but I can at least take care of her when she is my guest." And she went on getting out her shawl,

and settling her bonnet, with the cheery decision of a dear, damaged old canary bird.

Miss Boggs looked at me with curiosity; she had not recognized me as a fragile young Southern blossom before.

Let me give myself the pleasure of saying that I sent my protectress home in a cab, a form of luxury which in the course of our acquaintance I found she particularly appreciated. She never became accustomed to the city streets, she went about always in a flutter of fear and nervousness; yet she must have done a deal of "going" to get together her little articles and sell them. I saw her down town sometimes picking her way about among the rushing crowds and cars and trucks; going through the great buildings, with their incoming and outgoing streams of humanity eddying around the rows of elevator doors; and in the grimy newspaper offices, where the air was tense with silent activities; and as I looked at the quaint figure, the gentle, half-frightened, high-bred old face, I wondered why she was there. She must have lived some way since the war; why did she not go on now as she had before, and satisfy her ambitions, if she had them, by such lady-like efforts with genteel journals as she had made in the past, which had brought her much neighborhood consideration and a little money, and which did not tear her away from the dingy, dignified, green old home where she was born, and the simple, fixed, old-time life in which she was surrounded by friendliness, albeit most of the friends were gone?

It was gallant, yes, surely there was something to stir the blood in seeing so frail, so unarmed a creature take up the gage of battle against such odds; but it was painful, too. I all but resented the pangs she gave me. One day I said to myself, "This is worse than living one's own struggle over again," and that was a bitter saying. I was standing in one room of a newspaper office when I saw her enter an adjoining one. She went up to the managing editor's desk with her little soft, unbusiness-like manner, and seemed to be asking something. The man did not look up: if he had he surely would have spoken differently; but he was desperately busy, and he simply put his hand in a pigeon-hole and drew out a package of manuscript, saying irritably, as he gave it a shove along the desk, "Not a thing there that's worth a cent to us."

Oh, just the most ordinary business incident in the world; but poor little Fanny Marchbanks Overman! She took up her papers—I noticed again how old her hands looked—and moved away as if she did not quite see where she was going. I drew back out of sight. There are some pains that sympathy can only double.

I often had Miss Fanny at the little flat I kept with a friend, a girl who painted and taught. She never came to regard our establishment as a normal one, and she always hovered about me with a futile overflow of maternal care that was not in the least checked because it reversed the facts of our relationship.

"My baby child," she exclaimed beneath her breath, as she first sat down in our microscopic reception-room and looked about her, "to think of your trying to live in all these Yankee ways. I hope you take good care of her," she said to Amy, patting me softly. Amy looked blank for an instant.

She had an air of relief as well as pleasure when she found me one night dressing for a reception. All her innate love of the decorative and romantic came bubbling forth. "Ah, how becoming that is to you!" she exclaimed. "My father used to say that it was a test of blood and raising for people to dress up; that if there was anything common in them it would come out when they were in their best clothes. And shall you see any of the gentlemen of your office?" she asked, in an elaborately incidental way; and disappointment was in her face when I said I hardly thought I should.

"And they don't any of them come to see you," she went on. "I suppose you don't let them."

"Dear Miss Fanny, it has never come up. I don't think any of them ever thought of coming to see me."

"Dear me! Well, these Northern men are beyond me. I never knew of any gentlemen before who did not think of paying some attention to a charming girl whom they had the privilege of knowing."

Amy, who was standing behind Miss Fanny's chair, turned her eyes and hands to heaven, and then for one instant placed her palms in an attitude of benediction above Miss Fanny's infantine old head.

"I suppose you have to have your meals according to these New York ways, with your dinner in the evening, on Miss Amy's account," she said.

"Yes," I replied, "Amy prefers it so." It was a safe assertion, though I had never heard her express herself on the subject. Like the true Southerner she was, Miss Fanny never ceased to regard New York as the outside, phenomenal thing, and the standards of Wexville as the normal and accepted ones, although in her writing she flexibly enough assumed the other tone. That was mental; the maintenance of ancient standards personally was inarticulately felt to be a matter of loyalty and character.

Miss Fanny and I each experienced some good luck about the same time.

The "Evening Appeal" found occasion to

send me abroad, and Miss Fanny obtained a little regular work — the superintendence of the correspondents' column on a weekly paper. This brought her in only the most trivial sum, four or five dollars a week; but it did not take much time, and I knew from experience how happy was the change from total uncertainty to even this sum assured.

I hoped to see her make herself a little more comfortable and treat herself to a new gown. But when I sailed she came to see me off in the same overbrushed little outfit of rusty black that she had worn the day I first saw her.

A number of people visited me at the dock that day, and it has been a bitterly intruding thought since that I did not give Miss Fanny all the attention that God knows was in my heart for her; and it does not soften that reflection, but brings the keener pang, to remember that she was too much absorbed and delighted by my momentary social importance to have any thought of herself.

She went about giving my acquaintances disjointed bits of my history, personal and ancestral; and telling them with tears in her eyes how brave I was living here in New York, away from everything I'd been used to, and starting off now all alone on this voyage, though I was naturally of the most shrinking and feminine disposition. Dear Miss Fanny!

I did very little letter-writing during the eight months I was gone. I heard from Miss Fanny only once; but she was one of those who had urged that I spend none of my precious time reading or writing letters, so I was not surprised at her silence.

When I came back I went to the "business woman's boarding-house" the day after landing to look her up. Amy had just returned from a four months' absence herself — this was in September — and could give me no news of her.

The square was dusty and deserted; the house as I went in seemed peculiarly desolate in its orderly gloom. The servant was a new one; she had never heard of Mrs. Overman, and an indefinite dread began to gather around me. I sent for Mrs. Martin.

She came in colorless, sad dignity, and stood silently before me.

"Tell me," I said.

"She died in this house three months ago."

She sat down.

"I am sorry you were not here. It was a beautiful, easy death. She was not sick. We just found her lying on her bed one day with a letter in her hand, dead."

In the midst of all the formless thoughts and feelings crowding upon me I was pierced by a foolish grief that my little woman should die

on one of those prison-like cots, so strange and unhomely to her.

"The letter," Mrs. Martin went steadily on, after a moment's silence, "I had buried with her, but I kept a copy of it. This is it."

I half hesitated.

"I don't think you need mind reading it," she said.

It was very brief. In half a dozen lines Anthony Stottman acknowledged the receipt of a final payment of fifty dollars as wiping out the principal and interest of a debt of three thousand dollars left unpaid in the settling up of Judge Marchbanks's estate.

Ah, it was brief, but to what years of pinching and struggle, and high and tender purpose, that awkward paper testified. I saw all those years in a heart-bursting moment's glance. It was love as much as honor that had sustained little Fanny Marchbanks through that long task, so little in itself, so Titanic for her; no stain must rest on the great name her father left behind him. Through more years than I had lived every hour must have been colored to her by this heroic resolution. It had become her reason for living. When she had accomplished this end, the shock of revolution in her outlook, the withdrawal of the great motive, had been too much; the light that had been

sustained so long ceased. Mrs. Martin told me that Mrs. Overman had been restless, had almost ceased to write for two weeks before her death, although she seemed well.

Yes, I knew, I knew how, as with a child, the thought of her great achievement had absorbed her, and how she could not be at ease till the sensible testimony of it was in her hand. That brought her ease indeed. Truly it was a beautiful way to die.

"Where—where did you bury her?" I forced myself to ask.

"I was at my wit's ends, Miss Addington. Those I might have learned something from about her relatives were out of town, and I did n't know which way to turn; but at last I put her in my own plot, where I shall lie some day myself. I thought you would come after a while and tell me what to do. She left nothing but a few dollars, seven or eight, but I had things done decently. I know Mrs. Overman was a lady, and that letter showed she was something more, Miss Addington. I was glad to pay her respect." Mrs. Martin concluded with firm downright reflections, "God bless her!"

Miss Fanny had won for herself, in her last strange need, hospitality instead of charity, and with her letter on her bosom she might well be an honored guest.

Viola Roseboro'.

THE IRRIGABLE LANDS OF THE ARID REGION.

BY MAJOR J. W. POWELL, DIRECTOR OF THE U. S. GEOLOGICAL SURVEY.

EARLY half of the lands of the United States, exclusive of Alaska, are arid. By this characterization it is meant that the rainfall is insufficient to fertilize crops from year to year. In favorable seasons some of these lands receive sufficient rains during the months of growing vegetation to produce fair crops, but the years are infrequent when such conditions prevail, and the areas thus favored are not of great extent. That arid lands may be available to agriculture it is necessary that they be artificially supplied with water; and this is called irrigation. Every farm, orchard, vineyard, and garden is dependent upon an artificial supply of water. The tree on the lawn, the rose on the parterre, and the violet on the baby's grave must have some loving hand to feed it with the water of heaven or it withers and dies.

When the farmer sows his field and waits for the rains of heaven to fertilize it, if the

clouds are kind and come with gentle showers, he reaps a bountiful harvest; but when the heavens are as brass, famine stalks abroad, and when storms desolate the land, he plants in vain. But in the western half of the United States physical conditions like those of ancient Egypt and Assyria prevail. The clouds no longer fructify the fields with their showers. They rarely hover over the valleys and plains where the fields and gardens lie, but they gather about the mountains and hurl their storms against the rocks and feed the rivers. The dweller in the valley waits not for showers, or waits in vain; for the service of his fields rivers must be controlled.

But will not the hills of New England, the mountains and plains of the sunny South, and the prairies of the middle region be sufficient for the agricultural industries of the United States? The area is vast, the soil is bountiful, and the heavens kindly give their rains; why should the naked plains and the desert val-

PRINCIPAL DRAINAGE DISTRICTS OF THE ARID REGION.

leys of the far West be redeemed? Why should our civilization enter into a contest with nature to subdue the rivers of the West when the clouds of the East are ready servants?

Gold is found in the gravels of the West; silver abounds in the cliffs; copper is found in the mountains; iron, coal, petroleum, and gas are supplied by nature. The mountains and plateaus are covered with stately forests; the climate is salubrious and wonderfully alluring. So the tide of migration rolls westward and the arid region is being carved into States. The people are building cities and towns, erecting factories, and constructing railroads, and great industries of many kinds are already developed. The merchant and his clerk, the banker and his bookkeeper, the superintendent and his operative, the conductor and his brakeman, must be fed; and the men of the West are too enterprising and too industrious to beg bread from the farms of the East. Already they have redeemed more than six million acres of this land; already they are engaged in warfare with the rivers, and have won the first battles. An army of men is en-

listed and trained, and they march on a campaign — not for blood, but for bounty; not for plunder, but for prosperity.

But arid lands are not lands of famine, and the sunny sky is not a firmament of devastation. Conquered rivers are better servants than wild clouds. The valleys and plains of the far West have all the elements of fertility that soil can have. As the blood in the body is the stream which supplies the elements of its growth, so the water in the plant is its source of increase. As the body must have more than blood, so the plant must have more than water for its vigorous growth. These conditions of plant growth are light and heat. While the roots of the plant are properly supplied with water and other elements of plant growth, the leaves must be supplied with air and sunshine. The light of a cloudless sky is more invigorating to plants than the gloom of storm. Abundant water and abundant sunshine are the chief conditions for vigorous plant growth, and that agriculture is the most successful which best secures these twin primal conditions; and they are obtained in the highest degree in lands watered by streams and domed

by clear skies. For these reasons arid lands are more productive under high cultivation than humid lands. The wheatfields of the desert, the cornfields, the vineyards, the orchards, and the gardens of the far West, far surpass those of the East in luxuriance and productiveness. In the East the field may pine for delayed rains and the green of prosperity fade into sickly saffron, or the vegetation may be beaten down by storms and be drowned by floods; while in the more favored lands of the arid region there is a constant and perfect supply of water by the hand of man, and a constant and perfect supply of sunshine by the economy of nature. The arid lands of the West, last to be redeemed by methods first discovered in civilization, are the best agricultural lands of the continent. Not only must these lands be redeemed because of the wants of the population of that country, they must be redeemed because they are our best lands. All this is demonstrated by the history of the far West, and is abundantly proved by the history of civilized agriculture. All of the nations of Egypt were fed by the bounty of one river. In the arid region of the United States are four great rivers like the Nile, and scores of lesser rivers, thousands of creeks, and millions of springs and artesian fountains, and all are to be utilized in the near future for the hosts of men who are repairing to those sunny lands.

There are nearly 1,000,000,000 acres of these arid lands in the United States, of which nearly 120,000,000 acres can be irrigated when all such waters are used. Already more than 6,000,000 acres are cultivated through the agency of canals. Thus the experiment has been tried, and doubt no longer rests upon the practicability of western irrigation. It is fully demonstrated that the redemption of these lands is profitable to capital and labor. An acre of western land, practically worthless without irrigation, when the works are constructed to supply it with water at once acquires a value marvelous to the men of the East. In new California, settled but yesterday, cultivated lands command better prices than in Massachusetts or Maryland, and this is because an acre of land there will produce two or three fold the quantity of food for man or beast that an acre will here, for the average year. We of the East must recognize that while the lands of the West are limited in quantity to comparatively small and level tracts in the valleys and plains which can be served with water by canals, yet the limit in quantity has compensation in quality.

To accomplish the redemption of the arid region capital in large amounts is needed. Some lands can be reclaimed at a cost of two or three dollars an acre; others, ten or twelve; while in some cases, where lands are of great

value by reason of their proximity to cities, hundreds of dollars per acre will be expended to bring waters from distant springs or from the depths of the earth. A rough estimate may be made that 100,000,000 acres can be redeemed at the rate of ten dollars per acre—that is, for 1,000,000,000 dollars. In this work vast engineering enterprises must be undertaken. To take the water from the streams and pour them upon the lands, diverting-dams must be constructed and canals dug.

With most streams the water is insufficient to serve the lands, and a selection must be made. The conditions which should govern this selection, though somewhat complex, are of grave importance. The rains fall chiefly on the mountains and high plateaus, where the lands are nearly or quite valueless for agriculture. Cliffs, gorges, and steep declivities are not attractive features to the farmer. At great elevations snows fall and accumulate in vast fields, deep drifts, and icy glaciers, and linger long through the spring, sometimes remaining all summer. On these elevated lands late June and early September frosts come, and the days of July and August are not wholly exempt from their ravages. Thus the elevated lands are not attractive to agriculture. The farms, hamlets, towns, and cities have their sites away below on the sunny lands. Here and there mines of gold and silver attract a population and induce men to build homes in the upper region of snow. But their supply of food must come mainly from below. The mountain streams while yet small, as brooks and creeks, cannot be used to advantage, and when they leave the mountains they are in most cases already great creeks or rivers. A mountain stream flows in a deep, narrow gorge, down which torrents of water roll in mad energy. Such is the crystal river of the mountains. When it strikes the plain it is suddenly transformed. The steep declivity is changed to one of low degree, and a deep, narrow stream spreads into a broad sheet of water ten, twenty, fifty times as wide as above. When the river is thus transformed it undergoes another change; on the plains below it gathers the sands and dust, and the deep, crystal stream becomes a shallow river of mud. Such are the characteristics of the greater number of streams of all the arid region.

The place of transformation, where the mountain stream of pure water is degraded into a lowland stream of mud, is an important point when the stream is to be used in irrigation. If the waters are turned out in the valleys above, they are used where they will perform the least service, for the climate is unfavorable to agriculture. Such lands are chiefly valuable as pasture. Grass, potatoes, and rye, and in

general the crops of Norway and southern Alaska, may be cultivated with some success; but, in sight of the sunny plains below, it is a waste of water to use the rivers in these regions of ice. On the other hand, the streams cannot be used with the greatest advantage far down their course and distant from the mountains. The storm-waters and fierce winds of the low plains and valleys, that are arid and dusty for most days of the year, fill the valleys and shallow channels of the mud-bearing rivers with vast accumulations of sand. In these broad stretches the waters spread and are largely lost by evaporation. Very many of the streams of the arid regions, perhaps two out of three, are thus swallowed up by the sands, and are called "lost" rivers or creeks. Others have a sufficient supply from the mountains during seasons of flood to enable them to cross the hungry sands and deliver a part of their volume to lower channels in more humid lands, through which they find their way to the sea. They die in seasons of drought and live in seasons of storm. Still other rivers flow perennially but dwindle on their course over the dry plains. The "lost" streams must be used near to the mountains or not at all. The intermittent streams and the diminishing rivers should be used near to the mountains before a large part of their waters is lost. A stream that will irrigate a million acres of land near the mountains would be sufficient to serve only two or three hundred thousand acres a hundred miles away. There are other reasons why the river should be taken out from its channel where it emerges from the mountains. At that point diverting-dams can be constructed with the least expense and maintained at the least cost, and be made to command lands to the greatest advantage in the construction of minor canals; while the waters below, when charged with great quantities of sand, speedily destroy the works of irrigation, and the sands injure the fields.

Most irrigated lands ultimately require drainage. The bottom lands of the great rivers soon become filled with water, and are transformed into swamps and destroyed for the best agriculture. The low plateaus are ultimately far superior to them for all agricultural purposes. Thus it is that the higher lands away from the rivers and near to the mountains should be first served. Only a part of the water poured upon lands for their irrigation is evaporated to the heavens; another, and perhaps larger, part returns to the river. The irrigation of the upland creates many springs, which unite to form brooks and creeks, and the waters can thus be used again and again, but in diminishing quantities. A proper system of drainage not only improves the land drained, but conserves the water to be used

again. It is thus that with every system of supply-canals a related system of drainage-channels and canals must be planned for the benefit of the fields first irrigated and for the increase of the area of irrigation.

The season of irrigation is short, varying in different latitudes and altitudes from two to five months. In some regions of country the season of flood precedes and extends into the first part of the season of irrigation; in other regions flood-time comes late, when the time for supplying water is nearly past. In a few cases maximum supply and maximum want are coincident in time. In all cases where they are not synchronous the excess runs to waste; the unused waters are lost in the sea. During all the months when irrigation is not in progress the entire volume is unused, if the only structures are diverting-dams and canals. To save this water reservoirs are needed. In their construction and the selection of their sites many interesting problems are involved. Some of the conditions which govern the selection of sites are of great importance. Evaporation from the surface of water varies, under different climatic conditions, from thirty to one hundred inches. A reservoir most favorably located may lose less than three feet of water during the year, while, under most unfavorable conditions, the loss may be more than eight feet annually. Evaporation is greater in the hot, dry lands below and less in the cold, humid lands above. The law of diminution is complex, having many factors, and is not yet very well known, but the general statement made is substantially correct. For this reason storage-reservoirs should be constructed in the mountains. In many of the northern ranges of the West favorable sites are found. Already many mountain lakes exist that can be used for this purpose by deepening their outlets and constructing gateways, so as to permit the lakes to be filled when the waters are not needed and to be tapped when a supply is demanded. There are many mountain valleys that are morainal basins admirably adapted to this purpose, and where reservoirs can be constructed at small cost. The mountain regions of the West have many lakes of cold, emerald waters, and these are to be multiplied by the art of man and made to hold the waters needed to refresh the arid plains below — treasure-houses where the clouds are stored.

The mountain ranges of the western portion of the United States differ very greatly in their topographic characteristics. Sometimes advantageous reservoir sites can be found in the upper regions; sometimes low valleys, or parks, are found nearly inclosed by mountains

and foothills, while there are many ranges which have such steep declivities and terminate so abruptly on the plains that sites are infrequent. For such reasons not all of the mountain waters can be stored in mountain lakes, and it becomes necessary to construct reservoirs on the plains below. Here the stream-beds cannot be utilized, because of the difficulty of maintaining works on broad flood-plain lands composed of incoherent sands, and because the muddy waters below discharge their silt and fill the reservoirs with great rapidity, so that the life of such a reservoir is too short to warrant the expense of its building. Under such circumstances a river should be turned from its natural course into a canal near the point of transformation, and be conducted into some lateral valley which has been excavated by storm-waters. In general, favorable sites of this character are frequent. The valley is utilized by selecting some point where the inclosing hills converge, and there constructing a retaining-dam.

When all the perennial waters of springs, brooks, creeks, and rivers are used by canals and reservoirs, the total supply of available water for irrigation is not exhausted. All of the arid lands below have some rainfall, varying from three to twenty inches, from year to year, and from region to region. The rains which fall upon these thirsty lands are in part absorbed and ultimately evaporated, but often the storms come with great violence, and local floods arise therefrom. These storm-waters can be caught and stored in basins among the hills and used for agricultural purposes. The amount of water that can thus be saved is no mean quantity. But it must often be stored in small reservoirs of a few acres each; and this means the construction of ponds on farms, scattered here and there among the hills where sites are favorable; and the waters will thus be used on small tracts of land distributed far and wide over the arid plains and valleys. Ultimately the whole region will be covered with a mosaic of ponds fringed with a rich vegetation; and crystal waters, and green fields, and blooming gardens will be dotted over all the burning, naked lands, and sand dunes, alkali stretches, and naked hills will be decked with beautiful tracts of verdure. Not all the storm-waters will thus be caught; much will still fall into the great sand valleys and flood-plains, and there disappear in the sands; but such valleys have a floor of solid rock; and so the waters are stored in the silt of ancient floods, where they may be brought to the surface again by pumps and other hydraulic devices, and be made to irrigate many a stretch of farm land.

There is one more source of water. In the

flexing of the strata of the earth through geologic agencies subterranean basins are formed, where rocks below, impervious to water, are separated by water-bearing strata from the rocks above through which the water will not pass. Into these water-bearing strata wells may be sunk, and the water will often flow to the surface. Such artesian wells are often used in irrigation, and they will be used to a much larger extent in the future. Artesian waters are not found everywhere in the country, but only in geologic basins, and to select sites for them a knowledge of the geologic structure is necessary.

By the use of all the perennial streams during the season of irrigation, by the storage of the surplus water that runs to waste in seasons when irrigation is not practiced, by the impounding of the storm-waters, by the recovery of the floods accumulated in valley sands, and by the utilization of the artesian fountains, a vast area of the arid lands will ultimately be reclaimed, and millions of men, women, and children will find happy rural homes in the sunny lands.

From the brief account given it will be seen that in order to redeem the arid lands it becomes necessary: first, to select properly the lands to be redeemed; secondly, to select the reservoir sites where the water is to be stored; thirdly, to select canal sites,—and these should be dedicated to public use, so that individuals may not acquire title to the lands for the purpose of selling them to the farmers when the irrigating works are to be constructed, and thus entailing upon agriculture an unnecessary expense; fourthly, the extent and method of utilizing the flood-waters stored in the sands must be determined; fifthly, the artesian basins must be discovered and their extent and value revealed.

For this purpose there are necessary:

(a) A topographic survey, that the mountains, hills, and valleys may be outlined and their relative levels determined, and the whole represented on appropriate maps.

(b) A hydrographic survey. The waters of the streams must be gauged, in order to determine the volume which they carry through the different seasons of the year. Then the rainfall must be determined, for the amount of water to be supplied by canals is supplementary to this. Where the rainfall is twenty inches a small artificial supply serves the land; if it be but five inches a large supply is necessary. Then the amount of precipitation for various sites of reservoirs must be determined, to discover the amount which can be saved. And finally, it becomes necessary to determine the amount of water which is needed to serve an acre of land. This is called the "duty" of

water, and in the United States it varies widely. In some regions of country, where the rainfall is great and the soil favorable, the duty of water is large : a given amount of water will irrigate a broad tract of land. But where aridity is excessive and the soils are unfavorable, such given amount of water will irrigate but a small tract. For the purpose of measuring stored water many engineers have come to use an "acre foot" as a unit, which means an acre of water one foot in depth. In some portions of the United States an acre foot of water will irrigate two or three acres of land for one season ; in other regions two acre feet are necessary to the acre ; but these are extreme conditions. The general average, which largely prevails, may be stated as an acre foot of water to an acre of land ; and a lake which contains 100,000 acre feet of water will serve 100,000 acres of land for one year. In the practice of irrigation it is found that it takes two or more years properly to fill the ground with water, and for these first years a much larger supply than has been indicated is necessary. Where a supply has been secured for 100,000 acres by reservoir or canal, the lands which it will ultimately serve can be redeemed only through a course of years. Perhaps a third or a half of the land can be supplied for the first year, and to this new areas can be added, from season to season, until at last the whole duty of water is secured.

(c) An engineering survey. The reservoirs, canals, and ancillary appliances must be planned and their cost estimated.

(d) Finally, a geologic survey, to utilize the waters of the sand reservoirs and artesian wells.

Such are the scientific problems involved in the redemption of the arid lands.

A brief survey of some of the more important irrigable districts of the West will serve to set forth other interesting facts relating to this subject. In central Colorado the "Continental Divide" is a wilderness of desolate peaks that rise far above the timber line into regions of rime and naked rock. Here, with other rivers, springs the Arkansas, in deep cañons and narrow rocky valleys. Many silver creeks, with water flashing in cascades, unite to form a river which plunges down a steep mountain valley until it passes the foothills and spreads in a broad, turbid stream at the head of the great valley of the Arkansas. Then it creeps over the sands in tawny ripples, down the incline of the plains, becoming less in volume by evaporation and the absorption of the waters in the sands, but growing in size from the accession of smaller tributaries that come from distant mountains on either hand. After crossing the Colorado line it grows perceptibly smaller until a more humid region is reached, where other tributaries join it, and it soon be-

comes a great river. In the stretch that begins just above the State line and extends across Kansas its channel often becomes dry, and the sands drift in the winds from bank to bank. But in seasons of flood a broad, shallow torrent rolls across Kansas into the State of Arkansas and bears along to the lower region vast loads of mud, choking the navigable stretch below with "sand-bars," that act as dams, by which the floods are turned over the valley, and the fields are oftentimes destroyed. Already the farmers of Colorado have taken the water on their lands, and the river is made to do duty to its utmost capacity in seasons of drought. But the surplus waters yet run to the sea. Some of them can be stored on the plains ; but the land available for irrigation is far in excess of the amount which the river can serve. Where shall this water be used ? If in the mountain valleys, it will largely be wasted ; if in the great valley below, how shall it be divided between Colorado and Kansas ? It is worth millions of dollars annually. To whom shall it be granted ? If the larger part is to be used in Colorado, how shall it be divided between the several districts through which it passes ? The law is practically silent on the subject. Heretofore every man might help himself ; but at last the question has arisen, controversies have sprung up, and the States are almost at war.

The Rio Grande flows through San Luis Park, where there is a great body of comparatively level land. Here the waters have been taken out and many hundred thousand acres irrigated. Neglecting the tributaries, let us follow the river across the line into New Mexico. Again the water is taken out to irrigate valley stretches until the White Cañon in the Tewan Mountains is reached and the river rolls through a deep, rocky gorge for more than forty miles. Emerging, its waters are again taken out upon the land from point to point until the entire territory is traversed, and the river passes out of New Mexico and becomes the boundary line between Texas and Mexico. From its source to the mouth of the Chama above the White Cañon it is a clear, deep river ; below, it is a shallow river of mud. In this valley irrigation was practiced by the aboriginal village Indians centuries before the discovery of America. Prior to 1600 it was populated by Spanish peoples coming up from Mexico. So the gardens and fields of the territory and the region along the river from El Paso to the Gulf are old. Since the acquisition of the territory by the Government of the United States irrigation has greatly developed in Colorado and New Mexico, along the river itself in part, but mainly on the tributaries. No waters have yet been stored in

reservoirs, but the seasonal flow in dry years is now wholly utilized; and more: the river for hundreds of miles along its lower course is entirely cut off from a supply, and the gardens and farms are now lying desolate and the winds are drifting the sands over vineyard and field. During the past year more new works have been projected than now exist in the valley. How are they to be supplied in scant years? Who owns the water? Shall the men of Colorado take all that falls in their State? and if so, shall the settlements in the valley of the Rio Grande be destroyed by the new settlements on the tributaries? Just across the line of New Mexico the town of El Paso, in Texas, is found; and the town of Juarez lies on the opposite side of the river, in Mexico. Here large areas have been irrigated and many thousand people are engaged in agriculture; but they had little water last year, and the next dry season they will have none. Shall the people who have cultivated the land for more than a century be driven away?

The Green River heads in the Wind River Mountains, and, rolling over elevated cold plains, it at last reaches the Unita Mountains, and plunges through cañons to the mouth of the Grand. At its source the Grand insculcates with the Arkansas and the Rio Grande del Norte and rolls through a succession of cañons to the Green. Then the two rivers, joining in wedlock, become one indeed, and assume a new name, the Colorado of the West, which rolls into the Gulf of California. Its way for nearly 500 miles is through a succession of deep cañons, where it flows from 100 to 6000 feet below the general surface of the land. At last it emerges from the gloom of the Grand Cañon and runs in a valley through the lower portion of its course, now and then interrupted by a low range of volcanic mountains, through which it cuts its way in deep, black gorges. The region drained by the cañon portion of the Colorado and its tributaries and the region drained by the Grand and Green and their affluents are in the main inhospitable. All the streams flow through deep cañons between great blocks of naked rock, which are plateaus with cliff escarpments. Sometimes cañons widen into narrow valleys, and others are found at the foot of the mountains on the east and west, while far to the north are broad valleys inclosed by mountains; but these are cold and desolate. Some agriculture can be practiced by means of irrigation in the broad cold valleys above and the narrow warm valleys below, but a very small portion of the water of the Colorado will thus be used. A mighty river will ever flow from the mouth of the Grand Cañon. The region below the cañon on each side

of the Colorado is one of great aridity, with an annual rainfall of not more than three or four inches. It is also a region of high temperature in summer, and it has almost a frostless winter. Here date palms flourish with a luxuriance never known in Egypt. Oranges, lemons, pomegranates, and figs grow and bear in abundance, and the lands are well adapted to sugar and cotton. On the west lie Nevada and California. On the east Arizona stretches away to the summit of the Rocky Mountains. The lands to which the waters can be taken greatly exceed the area that can be served. How shall they be divided? The low flood-plain along the river is narrow, and only small tracts within it can be redeemed. If the waters are to be used, great works must be constructed costing millions of dollars, and then ultimately a region of country can be irrigated larger than was ever cultivated along the Nile, and all the products of Egypt will flourish therein.

The northern third of Arizona is a lofty table-land; the southern part is a stretch of desert valley over which desert mountains rise. The descent from the table-lands to the lowlands is marvelously abrupt, for it is marked by a line of cliffs, the escarpment of a geologic fault. Along this fault there is a fracture in the rocks below, and the table-land side has been uplifted several thousand feet. Through the fissure of the fracture lavas have poured in some places, so that here and there the escarpment is masked by volcanic rocks. All of the perennial streams of the territory, that run to join the sea, head on the table-land or in the Rocky Mountains of New Mexico. The rainfall of the lowlands is insufficient to create ever-living waters. The land has never a carpet of verdure, but a few scattered desert plants are found, many of which belong to the cactus family. Everywhere the landscape is weird and strange. Most of the mountains are naked of vegetation or bear dwarfed gnarled trees of pine and cedar, with aloe and cactus. The flood-waters that pour down these mountains sweep the disintegrated rocks into the valley below, and much of the region is filled to a considerable depth with sand and gravel. The storm-waters that come from the mountains sink into these valley sands and disappear; and the problem of this country is to gather the mountain waters into reservoirs at the foothills, and to recover them from the sands by artesian wells and pumps.

In southern California there is another drop of the land from San Bernardino Mountains to the coast, but its line is not so clearly marked as that of Arizona. From this southward to San Diego and from the coast eastward but a few score miles there is a land

of beauty. It is forever fanned with mild breezes from the Pacific, and thus cooled in summer and warmed in winter. When the rainy season comes its billowing hills are covered with green, and when the dry season comes the hills are covered with gold. The rainfall is almost sufficient for agricultural purposes; springs burst from the hills, and creeks meander to the sea. The little valleys open into broader marshes near the shore that are hardly above the tide, but they are often leveed by the waves of the sea, and wave-formed embankments beat back the high tides and protect the meadows that are inclosed by hills. Among the hills natural basins abound, into which the clouds may be enticed as they fall upon the ground, and into which the fountains may pour their waters. It is a region of country singularly well adapted to lakelet-reservoirs, where every man may construct one or more on his own farm. Little artificial supply is needed, and this can be easily secured; and a region of country about the size of Italy, with the climate of Italy, is rapidly becoming covered with the gardens of Italy.

The Sierra Nevada culminates in altitude near its eastern margin. It is a great plateau declining westward, and carved into transverse ridges and valleys, that extend from the high eastern summit of the system to the low warm valley of California. Between the valley and the sea the Coast Range rises. The San Joaquin River heads in the heights of the south, and runs northward. The Sacramento heads far to the northward, where volcanic mountains stand. The rains and snows that fall on these peaks sink away into the scoria and sands of volcanic cones, and the mountains where the clouds gather and the storms rage are yet streamless; but away from the mountains, where volcanic sands disappear, the mountain waters burst out in mammoth springs, and creeks and rivers are born full grown. The Sacramento and the San Joaquin unite to flow through the Golden Gate. In the southern or San Joaquin valley irrigation is already practiced, and the streams are partly or wholly used during the season of growing crops. The chief development of the area of agricultural lands in this region is to come from the construction of reservoirs for river and storm waters, and through the development of drainage systems, so that the water may be compelled to do double or treble duty. In the Sacramento valley irrigation has been practiced to a very limited extent, for the rainfall is considerable, and the people until the last year or two have been proud to affirm that their climate was humid; but they are now beginning to learn that even with them irrigation is highly advan-

tageous, and that the product of the field may be multiplied more than threefold through the agency of rivers.

It is in the valley of the Sacramento and its tributaries that the great deposits of gold gravels are chiefly found, and that extensive hydraulic mining has been carried on. The rivers of the Sierras were turned into reservoirs, and their waters, under high pressure, through the agency of monitors, were set to tearing down the hills of gravel and washing them away into the Sacramento. But these operations soon choked the stream and caused it to overflow the adjacent lands, and the sands and gravel brought down were deposited over the lands, and thus fields and towns were buried and populous regions were temporarily destroyed. Then the farmers of the valleys, through the legislature and the courts, stopped the mining operations; but strife still rages. The greed for gold and the hunger for fruit and wheat still spur the miners and farmers, and the conflict is irrepressible. Some day or other, when the madness has subsided, they will quietly discover that both parties are equally interested in the control of the rivers; that all of the waters of these regions can be stored in reservoirs and used at will, and that the valley of the Sacramento can be irrigated to multiply its agricultural products and its gold mines worked by the same agency, and that the miners and the farmers have common and harmonious interests in the hydraulic problems of the fairest land under the sun.

In geologic times, not long ago as speaks the scientific man, but very long ago indeed as speaks the chronicler of human follies, there was a deep valley on the eastern slope of the Sierra Nevada at the headwaters of the Truckee River. About this valley towered granite mountains. But earthquakes came, and rents were formed in the rocks, and out of the fissures poured monstrous streams of lava. One of these fissures crossed the lower end of our mountain valley, and through it poured floods of molten rock. Stream after stream issued, to cool in solid sheets and blocks, until a wall was built across the valley two or three thousand feet in height, and above it was a deep basin five or six hundred square miles in area. The storms that fell on the granite and volcanic mountains rolled in rivers to fill the basin, and Lake Tahoe was created. When filled, at last, its waters overflowed the rim of lava, and the Truckee River now springs from the Tahoe fountain. Its deep waters are dark with profundity, like the clouds of a stormy sky, but about its shores a few shallow bays are found, and emerald waters, like festoons of beauty, encircle the deeper and more somber lake. Back from the waters forest-clad slopes rise

towards the heavens, and above are seen naked crags and domes of granite. Farther to the north, Donner, Independence, and other mountain lakes discharge their waters into creeks that join the Truckee. It is thus that a large hydrographic basin is formed in the mountains where torrential rains fall and deep snows accumulate in winter months, and in which the waters are collected to form the Truckee, which leaves the mountains in a dance of delight and with a never-ending song of laughing waters. Sweet valleys are found below, for the people have in many places reclaimed the desert and encircled their homes with verdant fields. But the waters are all caught in California, while the irrigated lands are in Nevada; so the farmers of the Silver State must go to the lands of the Golden State to construct their reservoirs. The water of the lake can be partly discharged each year by deepening its outlet and the water used for irrigation in Nevada, and after the irrigating season is over the gates may be closed and the lake permitted to refill; but this perhaps will mar a pleasure resort. Who shall judge between the States? A very large part of all perennial waters to be used in Nevada have their sources in California. Who shall judge between the States?

In southern Utah a bold escarpment or cliff of rocks two thousand feet in height is presented towards Arizona. This is the edge of a plateau which extends far northward into central Utah. It is cut in two by a river which heads a little back from the brink of the cliffs and runs to the north; and so, except at the very southern extremity, two plateaus are found, which unite between the head of the river and the verge of the cliffs. This one-two plateau lies high and is covered with great forests, where rains and snows fall in abundance, and the waters gather to form the Sevier River. Along its upper course and beside some of its tributaries there are small valleys that are high and cold; yet grass, rye, oats, and potatoes can be raised in the short summer. Forty miles from its source the river enters a deep cañon, and when it emerges a broad and beautiful valley is found. Down this the stream meanders, and then turns westward and vanishes in the sand. It is a lost river. Just above the sink and along the valley through which the river meanders there is good and abundant land—much more than the river will serve; and here the Mormon people, who have institutions and customs like nations of the Oriental world in more than one respect, cultivate the soil by irrigation in the same manner. There are lands above the central cañon and lands below; but the river cannot serve them all. The earliest settlements were below. Later settlements have been

planted above, in the sub-arctic lands, and they are taking the waters away from the older towns and farms. And how is justice to be rendered between these conflicting interests?

North of Mt. Nebo lies Utah Lake, which is fed by the Provo River and a number of beautiful creeks. About the lake and along the streams the people are cultivating the land by irrigation. But the surplus water is still discharged into the lake, which constitutes a great reservoir. From the lower end of the lake the river Jordan flows on to the Dead Sea of Utah, the Great Salt Lake, on whose shore the Mormon Temple stands. Large areas in the valley are watered from the river. The Utah Lake divides a hydrographic basin. On the Provo and streams above there are favorable sites for reservoirs, and there are areas of land that can yet be irrigated; but if the waters are used in the upper valley they cannot be used along the banks of the Jordan. All increase of the irrigated area above will decrease the irrigated area below. Who shall divide the waters and relegate them to the best lands in the interest of the greatest number of people?

Bear River has its sources partly in Idaho and partly in Wyoming. Where its upper affluent creeks are assembled it runs northward across the Utah-Idaho line. At this point it expands into a broad sheet of water known as Bear Lake, which is divided into two nearly equal parts by the territorial line. The surface of the lake is about six thousand feet above the level of the sea. The river, after leaving the lake below, runs northward for a long course into Idaho, and then turns upon itself and recrosses the territorial line into Utah. The course of this great curve is through cañons and cañon valleys, but at two or three points the valleys expand so as to present small areas of irrigable land. In general, above the Utah line, the region drained is mountainous. From this point the river flows through a steadily expanding valley until it empties into Great Salt Lake. Now it is possible to use much of the water of this stream in the upper region on mountain valley lands, where hay can be cultivated and some other of the crops of cold climates. Another portion can be used in Idaho, while the great valley along the whole stretch of the river is admirably adapted to irrigation. Bear Lake itself, which lies in two Territories, is ultimately to become the chief reservoir, but others can be constructed above, and still others below. Thus the reservoir system must be distributed between the two political divisions, while the great body of the lands to be redeemed are in Utah. How these lands are to be selected, and water-rights relegated to such lands, is a serious problem which demands immediate solution, for the people are already

in conflict. Angry passions have been kindled, and war would ensue were it an international instead of an interstate problem.

The Snake or Shoshone River heads in the great forest-clad mountains of Wyoming and runs across the line into Idaho, then passes quite across the Territory until it becomes the boundary line between Idaho and Oregon. Passing the northeastern corner of the last mentioned State, it enters the State of Washington, and runs westward for a long reach until it debouches into the Columbia. The Shoshone River is one of great volume, second only to the Colorado. Reservoir sites along its course in Wyoming and Idaho have already been revealed by the surveys, and it is shown that in the upper region water can be stored to an amount of more than 2,000,000 acre feet. This will irrigate at the first usage at least 2,000,000 acres of land; and if they be properly selected, so that the waters can be collected again and again after serving the land, the area redeemed will be more than 4,000,000 acres. There are many other tributaries below that have not yet been examined, and it is safe to say that the waters of the Shoshone with its tributaries may ultimately serve from 8,000,000 to 10,000,000 acres. In its utilization three classes of problems are involved. If the waters are taken out in small canals near to the river and the lowlands served first, and prior rights and interests established on such lands, then but a small part of the stream can be used, and the greater part will run away to the Pacific Ocean; and subsequently the region of irrigation can be enlarged only by buying out vested water-rights scattered along the course of the river. But if at the very beginning the water can be taken out high up the river and carried in great canals to either side and there distributed to the higher lands, and used over and over again on its return, a complete utilization can be secured, and the cost of the construction of the system of irrigation by reservoirs and canals will be greatly reduced per acre. To irrigate 2,000,000 acres of land near to the river by short canals taken out along its course here and there will cost more than half as much as the construction of hydraulic works that will serve from 6,000,000 to 8,000,000; while the scattered minor works will be forever subject to destruction by the floods, and the agriculture secured will be of less value per acre, because the best lands will not be served, and only imperfect drainage will be secured.

The valley of the Shoshone has an interesting structure. In late geologic times it has been the site of great volcanic activity. The eruptions have not produced cones and mountains, but fissures have been opened and broad sheets of lava have been poured out over the

region. It is a valley of volcanic mesas or low table-lands. On the basaltic rocks thus poured out a peculiar surface is developed. The floods of cooling lava roll down in waves and bubble up in domes, which often crumble and fall in, leaving many pits, and the general surface is thus exceedingly irregular; but the irregularities are not on a great scale so as to produce high hills and mountains. The process of degradation by frost and heat, by wind and rain, smooth out these irregularities; the higher points are degraded and the lower places are filled. Many of the eruptions in this valley are of such age that their surface has been smoothed out in this manner; but there are many others so irregular that the mesas are covered with pits and naked rocks, and are thus wholly worthless for agricultural purposes. The second great problem is properly to select the mesa lands to which the waters shall be distributed. A part of the storage of the water must be in Wyoming, while the lands to be served must be in Idaho, Oregon, and Washington. These are interests over which nations would speedily be at war; in this country they involve interstate questions, and must be settled by the General Government.

Space fails me to describe the beautiful lands of the Columbia and its tributaries, but interstate and international problems are involved. The Columbia comes from British territory. One of its affluents, the Kootenay, heads in British territory, passes into Montana, and returns to British territory. Passing over to the Missouri, some of its waters head in foreign lands, and Montana, North Dakota, South Dakota, and Nebraska are interested.

Along the hundredth meridian from Manitoba to Mexico there is a zone of semi-arid land. Years ago, when the writer first began investigations into the agricultural prospects of the far West, he abandoned the designation "desert" and adopted the term "arid," as more properly characteristic of the country. For the one hundredth meridian zone he at first adopted the term "sub-arid," but it gave great offense, and the suggestion that irrigation was necessary to its successful cultivation was received with denial and denunciation, for at that time the advantage of artificially supplying water to cultivated lands was generally unknown. Seeing that the term "sub-arid" was a red flag to kindle anger, it was dropped, and the term "sub-humid" was adopted; and now the hundredth meridian zone is generally known as the "sub-humid" region. The average rainfall, which varies much from year to year, is about eighteen inches on its western margin, and increases to about twenty-four on its eastern edge. Passing from east to west across this belt a wonderful transformation is ob-

served. On the east a luxuriant growth of grass is seen, and the gaudy flowers of the order *Compositæ* make the prairie landscape beautiful. Passing westward, species after species of luxuriant grass and brilliant flowering plants disappear; the ground gradually becomes naked, with "bunch" grasses here and there; now and then a thorny cactus is seen, and the yucca thrusts out its sharp bayonets. At the western margin of the zone the arid lands proper are reached. The winds, in their grand system of circulation from west to east, climb the western slope of the Rocky Mountains, and as they rise they are relieved of pressure and lose their specific heat, and at the same time discharge their moisture, and so the mountains are covered with snow. The winds thus dried roll down the eastern slope into lower altitudes, when the pressure increases and they are heated again. But now they are dry. Thus it is that hot, dry winds come, now and then, and here and there, to devastate the sub-humid lands, searing the vegetation and parching the soil. From causes not well understood the rainfall often descends in fierce torrents. So storms and siroccos alternately play over the land. Here critical climatic conditions prevail. In seasons of plentiful rain rich crops can be raised without irrigation. In seasons of drought the fields are desert. It is thus that irrigation, not always a necessity, is still an absolute condition of continued prosperity. The rainfall is almost sufficient, and the artificial supply needed is small — perhaps the crop will rarely need more than one irrigation. A small supply for this can be obtained from the sands of the river valleys that cross the belt. In some regions artesian waters are abundant; but the great supply must come from the storage of storm-waters. The hills and mesas of the region are well adapted to this end. Under such conditions

farming cannot be carried on in large continuous tracts.

Small areas, dependent on wells, sand-fountains, and ponds, must be cultivated. It is a region of country adapted to gardens, vineyards, and orchards. The hardier fruits can be cultivated at the north, and sub-tropical fruits at the south. From this region the towns and cities of the great valley and the capitals of trade in the East will be supplied with fruit and vegetables. It is the region of irrigation nearest to them, where gardens and fields produce richer, sweeter products than those of humid lands. Already the people are coming to a knowledge of this fact and are turning their industries in the right direction. The earliest settlements have been planted in seasons of maximum of rain, and the people who came had dreams of wealth to be gathered from vast wheatfields. Now wholesale farming is almost wholly abandoned. In the last twenty years, during which the writer has been familiar with the sub-humid zone, having crossed it many times and traversed it in many ways, he has seen in different portions two or three tides of emigration, each ultimately disastrous, wholly or in part, and settled regions have become unsettled by migration to other districts. But from each inflow a few wiser men have remained and conquered prosperity; and now that the conditions of success are known, he is willing to prophesy — not from occult wisdom, but from a basis of fact — that the sub-humid region will soon become prosperous and wealthy.

The Arid Land is a vast region. Its mountains gleam in crystal rime, its forests are stately, and its valleys are beautiful; its cañons are made glad with the music of falling waters, its skies are clear, its air is salubrious, and it is already the home of millions of the most energetic men the world has ever known.

J. W. Powell.

MEMORY.

SOME years since, Francis Galton, in a most worthy-to-be-read essay upon twins, showed how the original fiber of the human individual asserts itself against training and environment. Nevertheless training and habit are potent factors in determining not only the action, but also the characters of individuals. This is so chiefly because the nervous system has been endowed with a faculty or attribute commonly spoken of as memory. To the consideration of this faculty the present article is devoted.

IN entering upon the discussion of any subject it is essential first clearly to define the terms which are to be used. The big-headed, shaggy-locked founder of the English dictionary, Dr. Johnson, defines memory as the power of retaining and recollecting things past, and consciousness as the power of knowing one's own thoughts and actions. Probably he was in accord with the majority of mankind in associating consciousness and memory as two functions of the brain which are so inseparable that without consciousness there is no memory, and without memory there is no consciousness. This is, however, a mistaken idea.

Memory is really a function entirely apart from consciousness, and consciousness is distinct from memory; the two faculties dwell over against each other, but have no necessary connection.

If the spinal cord of a frog has been cut in the neck and its brain destroyed, its hind legs are of course separated from the brain in which consciousness exists. If one of the feet now be dipped into a dilute acid, the legs are immediately drawn up. This so-called reflex action is produced by the traveling of the irritation from the leg up the nerve to the spinal cord and the consequent excitement of the ganglionic or nerve cells in the spinal cord, which give rise to an outgoing impulse that travels back along the nerve and causes the muscles to contract. If now a little acid be dropped upon the end of the back, the frog will try to brush it off with the foot handiest to the position. If this foot be cut off, the animal will endeavor to brush off the irritating acid with the stump, and failing to reach the part will remove the irritant with the other foot. There is no consciousness in the frog. If it be put in a vessel of water, the liquid may be gradually brought to the boiling point without any sign of life or feeling being manifested. The brainless frog moves its foot because in successive generations whenever consciousness has recognized the existence of some irritant upon the back frogs have taken the leg and brushed off the irritant; in this way a habit of action has been formed, and in the fullness of time it has happened that whenever there is a point of irritation upon the back of the frog the leg responds to the irritation in a reflex manner through the spinal cord without the brain of necessity consciously recognizing the irritation. In other words, successive actions have registered themselves in the lower nerve centers, so that a peculiar irritation converts itself into apparently purposive muscular movement without the intervention of consciousness. The little spinal cell, whose power is manifested only in motion, has unconsciously remembered that in times past whenever a certain impulse has reached it from the surface of the body and passed upwards to be felt in the brain, it has in obedience to consciousness directly sent out certain nervous forces which have produced motion; and as the result of such unconscious recollection on the part of the spinal cell, motion is produced whenever the originating impulse is received by the cell, although consciousness has been abolished.

If the section of the nerve centers of the frog be made at such a position that it cuts off only the higher portions of the brain, in which consciousness resides, the frog is converted into an extraordinary automaton. If the foot of the frog be irritated, it moves it out

of the way; if the frog be thrown into water, it rushes in blind haste to and fro; if the water be heated, the frog crawls out up the side of the vessel in order to escape. There is every appearance of purposive action. If the frog be placed on the table and its back be gently stroked, there seems to come to it memories of happy courtship hours spent in swamp or bog, and it breaks forth into the love song so admirably paraphrased by Aristophanes as *βρεκεκεκεξοαόξοαόξοαόξ*. Yet the frog has not real consciousness. If food be placed before it, it pays no heed; though starving, it eats not, but dies of hunger in the midst of plenty. Unlike Tantalus, it is not tormented by ungratified desires, but perishes because it has no desires to gratify. If the food be put far back into its mouth so as to reach the gullet, the muscle contracts upon it and the morsel is swallowed, because the gullet has the unconscious memory of having swallowed when in the past food has been put into it. Once swallowed the food is digested, and the animal lives on. Put in the air and let alone, the frog is as a clod, until the sun withers it, and the wind blows it away. Without power to recall the past or to recognize the present, it sits motionless and mysterious as the Sphinx, buried not in the profundity of its thoughts, but in the abyss of its thoughtlessness. The movements of such a frog, whether those of swimming, climbing, or swallowing, are parallel with the simpler movements which occur in the frog whose cord has been cut lower down. The love song which it sings when stroked is the mechanical repetition of the expressions of its feelings through generations when replying to the caresses of its mate. The only difference between the two frogs is that in the second frog, in which the upper brain alone has been destroyed, the impulse traveling from the surface is able to pass a little higher up and reach not only the lower centers, but also those higher nerve centers which preside over more complicated movements.

In a similar way men and animals may walk on during sleep. A cavalry officer, speaking of one of the raids around Richmond during the Rebellion, said to me: "Successive days and nights we had been in the saddle, until from sheer exhaustion the whole regiment was asleep. The horses slept as they staggered on, the men slept in their saddles; but with the rebels behind and hope in front the whole command steadily marched onward." At every turn in the road it was necessary to station sentinels to waken horses and riders, who otherwise would have gone straight onward into fences, ditches, or mayhap over a precipice. "Indeed," said the officer, "I had a friend whose horse did walk with him into an abrupt abyss."

There was no upper brain memory of the past, no consciousness of the present, in that automatic mass of man and horse, which, though sleeping, walked forward by virtue of the recollection which lay in the lower nerve centers.

Memory is, then, entirely apart from consciousness. It is a function of nervous matter to be impressed with its own actions. If a nerve cell has once acted, it has a tendency to act again in a similar manner. If this action has been sufficiently repeated, the memory of it becomes stamped upon the little cell, and that stamp remains and dominates that cell. As a result of the influence exerted upon the cell, there has been formed, so to speak, a mold of that influence, by virtue of which, when the stimulation again comes, the cell reacts as it formerly had done. It is this fact which makes the training of children possible, and it is this that makes the responsibility of training children so terrible. Fixed habits are but the expression of organic form in nerve cells. We see this in disease as well as in health. A child receives a blow upon the head, and notwithstanding the healing of the cut there is still irritation of a peripheral nerve by a piece of stone or other foreign body left in the wound. Epileptiform convulsions result. The surgeon fails to recognize the cause of the trouble, and the convulsions are frequently repeated, until perhaps a wiser doctor sees and removes the irritating matter. Yet the convulsions go on. If the operation had been done early the child would have been saved, but it is too late. The nerve cells have had the convulsive stamp impressed upon them, and there is no power given to man to fill up the deep places or plane down the projecting corners of the mold.

If the sciatic or big leg-nerve of a guinea-pig be cut, the skin of a certain region of the face sensibly alters in structure, and epileptiform convulsions occur whenever any of this altered skin is irritated. If the affected skin be now cut out, the convulsions cease; but if the convulsions be allowed to continue, the habit is stamped not only on the mother guinea-pig on whom the original operation was performed, but on generation after generation of guinea-pigs. The memory of the nervous tissue for disease has been so terribly true that it has transmitted itself through successive generations.

A case which occurred some years ago in Philadelphia further illustrates the separateness of the higher intellectual memory from consciousness. A very old woman was dying; as the shadows of death gathered about her, she sat propped up in bed, holding her hands extended in front of her as though reading from a book, and speaking a jargon of words which no one could understand. At last one

well versed in languages came and said, "She is repeating the Portuguese Bible." When her history was inquired into it was learned that until the age of five or six years she had lived in Rio Janeiro, and no doubt had frequently heard the Portuguese Bible read; but during the many decades which she had resided in Philadelphia she had neither spoken nor read Portuguese. Yet when the veil was being torn off, when consciousness had already gone, and the lower nerve cells had power to assert themselves, there came forth, clear and sharp, the words that had been read in her presence when, a little toddling girl, she had haunted the streets and houses of Rio Janeiro. The sound had left its impress on the nerve cells as the type does upon the paper. Thus it is that in the presence of death a panorama of the past flashes with the velocity of thought before the consciousness. All persons are consciously and unconsciously molding in their brain cells records innumerable. Things that we reck not of leave their impress there; stamp comes upon stamp like the various writings in an old palimpsest, in which the lower writings seem entirely obliterated until they are revealed by the processes of the antiquarian. So when the vision of the higher centers is sharpest it can see through the maze, and it may be in a moment decipher the records of a lifetime; or, when the restraining influence of the higher centers has been removed during delirious unconsciousness, muttered words, broken sentences, or clearly spoken periods, and mayhap even acts, give to bystanders glimpses of the passing visions.

Recently there has come to my notice the case of a man who under the influence of disease has recurrent visions of various character. Among these is a crescent of burnished silver from which dangle faces in great number; some unknown, some recognized by consciousness as those of acquaintances who had long passed out of recollection. As some of the faces were recognized only with difficulty, it is more than probable that the strange countenances were those of persons who had been previously seen, but the connection of whose impression upon the lower centers with consciousness was originally so faint or had been so long neglected that the thread could not be reunited. This case surely shows that physical shapes stamp their finest impression upon nerve centers, and that such stamp may be widely separated from conscious recollection and yet be firmly held through the years.

A little while ago I met a Quaker gentleman whom I had known in youth and I said to him, "Good morning." He gave me no answer. I said again, "Good morning, Mr. Jones!" He then said, "Horatio, excuse me,

I did not hear thee the first time." I asked him, "If you did not hear me the first time, how did you know that I had spoken?" What had happened was exactly this: there had been an impress made on the lower centers of that man's brain by my first salutation, but the impress had not been sufficiently strong to attract his attention. When his consciousness was awakened by my second salutation it looked down and saw the faint impression made upon the lower centers a moment before. That impress had been left permanently, although unnoted.

When we are trying to recollect a thing, we are simply searching here and there among the records in the brain to see if by chance we can find the leaf that we want to read.

What an index catalogue is to the searchers in a library, that to the searcher of brain records are the laws of association; and precisely as a purely alphabetical or arbitrary catalogue may assist the student, so may an artificial system of mnemonics assist the brain-delver.

The separateness of memory and consciousness is also illustrated by some of the extraordinary phenomena which are connected with the so-called local memories. Among the local or isolated memories the most distinct and sharply cut is the memory for words. It is entirely separate from the memory for things. As an instance showing this, I may cite the case of my own daughter, who when learning to read would recollect words as things, but not as words. She would say "b-e-a-u-t-i-f-u-l—handsome, pretty, good-looking." The meaning of this congregation of letters she could remember, but not the name of it. It is curious to note that this failure to remember names is in this case a clearly inherited mental defect.

When disease affects the brain these alterations of word-memory are something very strange. In the most complete form of this so-called aphasia the person cannot understand words, he cannot think in words, and cannot talk words. Usually, however, words are remembered sufficiently to be recognized when heard or seen, but although the idea is there, the person cannot speak in words. I recall the case of an old German woman who had aphasia. When asked how old she was, she would indicate sixty with her fingers. If asked how many children she had had, she would indicate seven. If two of the fingers were turned

down she would get angry and insist on the seven. She was able to understand questions. She knew what the figure "7" meant, but had not the power to say the word "seven." It is a very curious fact that in these forms of aphasia the language of the emotions may be preserved while the language of the intellect is destroyed. Very often a profane man, when he has aphasia, is able to swear. This German woman, when excited, could say "Gott in himmel!" Besides this there was left to her but one little fragment of each of the two languages which she had known. She could not say the English "no," but could say the German "nein"; she could not say the German "yah," but could splutter out the English "yes."

The forms of aphasia known as word-blindness and word-deafness are very strange. The sufferer from word-blindness can write and will understand what is said to him; he will talk to you and perhaps talk you to death; but hand him a book, a newspaper, or even the letter he himself has written, and he cannot read a word. Thus an active man of business having written a letter, giving directions for an important matter, attempted to read it, in order to see if it was correct, but was astounded to find that he could not make out a single word; he had been suddenly stricken with word-blindness. The sounds of the words and the words themselves had remained to him, but the recollection of the written forms of the words was gone.

In a case of word-deafness the person can talk and can write, but although his hearing is perfect he cannot recognize the spoken words. The sound of the voice is plain to his sense, but conveys no thought to him.

The records of the past—the unconscious memory, so to speak—exist in the brain; but for conscious recognition these must be dragged out before the consciousness. It is doubtful whether there is such a thing as a bad memory, *i. e.*, as a badly kept brain record. The difference in individuals as to the power of recollecting probably consists in the relation between consciousness and memory. One man has the power of going into the library in his brain and picking up at once the leaf he wants, and glories in his good memory. Another cannot in a moment find what he desires, but when the floods of disease come, then spontaneously float up those things which he had thought were gone forever.

H. C. Wood.

THE NATURE AND METHOD OF REVELATION.

IV.—REVELATION AND FAITH.

THE term "revelation" is commonly used to denote religious truth, supernaturally communicated, as distinguished from the knowledge of God obtained by natural means. In this use of terms, revealed religion stands in contrast with natural religion. But all our knowledge of God, through whatever medium derived, is from one ultimate source. That source is a revelation, or disclosure, which God makes of himself. And all truth respecting things divine and supernatural is apprehended by faith. Faith is the word descriptive of the mind's reception of it. Hence, in speaking of faith, and illustrating its nature, we may fitly take into view the fundamental truths of natural theology as well as Christianity.

It is often said, and the same thing is more often insinuated, that faith is something independent of evidence. It is looked upon as belief for which no reasons — that is to say, no valid reasons — are to be assigned. The individual himself, such is the implication, may perhaps be fully persuaded, but nothing that he can say constitutes an adequate ground of conviction for other minds than his own.

One occasion of this impression is the failure to distinguish between the sources and the proofs of religion. The genesis of religion as a fact of experience is one thing; the proofs of its reasonableness and the vindication of faith against skepticism are another. The genesis of religion is primarily from within, and not from without. As Aristotle styled man a political animal, it may be affirmed with even more emphasis that man is a religious being. Religion is not something foreign to his nature, imported into it from the external world, inculcated as a piece of information by his elders; nor is it, in its origin, an inference from the marks of design stamped upon things about him. The roots of religion are not in any process of the understanding. The idea that religious faith is a delusion of the imagination, a superstition engendered by dreams or by the fancied sight of ghosts of the dead, is disproved by history and philosophy. Religion is too deeply embedded in human nature, it is too powerful a factor in the history of mankind, to be accounted for by any of these superficial conjectures. Faith in the Being above us, the Author of our being, springs out of the sense of dependence

and the feeling of obligation and of law,—law felt as the manifested will of another, even the Infinite Spirit in whom we live,—and it is born of that yearning for a higher fellowship with him which alone can fill the soul with peace and joy. This primal revelation of God in the soul is the fountain-head of religion. However vague this impression may be in the beginning, however obscure the perception, and however dim it is rendered by the absorbing quest for earthly pleasure, it is the light of all our seeing. There is a *nisus* in the souls of men—a tendency to "seek God, if haply they might feel after him, and find him." This implied recognition of the existence of God is that from which—as John Calvin, in unison with the most profound philosophers of all ages, expresses it—"the propensity to religion proceeds." Here is the germ of our distinct and defined religious convictions. The latent anticipations of our nature are met and matched by the manifestation of God in the material world, in history, or the providential succession of events, and in Christ. These manifestations constitute the objective proofs of religion. They are real proofs. Drawn out into explicit statements, they constitute the arguments for Christian theism. It is true that no constraining efficacy belongs to them. But the same is to be said of all reasoning that is not strictly demonstrative. No other interpretation of the phenomena is so satisfactory to the unbiased reason of thoughtful inquirers. At the same time, another interpretation of the phenomena is always *possible*. Here it is that the primal disclosure of God in consciousness, the native "propensity to religion," when it is not dulled or stifled, avails to banish doubt. Let it be noticed, also, that this very religious constitution, by which we are inwardly drawn to God, correlated as it is to objective manifestations, constitutes an argument for the verity to which it points.

The great church historian Neander, whose living experience of religion opened to his mind its true philosophy, has these noble words respecting Socrates: "Socrates stands at the head of those men of supreme distinction in the world's history who, in the times when faith in anything divine and in objective truth has been shaken and shattered by the sophistry of an understanding that disintegrates all things and the power of an all-embracing spirit of denial, have led men back into the depths of

their soul which is akin to God, and have caused them to find in the immediate consciousness of the true and the divine an assurance lifted above all doubts. From the speculative questions, in answering which the spirit ever anew tires itself out, he turned their glance within upon their own moral nature. From the external world he called the spirit back to its own inner being, that it might there find its whereabouts and learn to be at home. It is the weighty 'know thyself' which the oracle at Delphi praised as the characteristic merit of Socrates. The great impulse that went forth from him worked on for centuries, and in later times was continually renewed by the agency of men who carried down his spirit to after ages; and this influence it was which directed attention to that in man which is immediately related to God and to the moral element in the human soul, as well as from this, as the starting-point, to the religious." What skeptical minds need in this age, as in every other, is to remember that man has a soul as well as an understanding. Conscience, sensibility, affection, aspiration are a deep and indestructible part of human nature. As there is a soul, there is a life of the soul. There are presages and inchoate beliefs native to human beings, existing by their own right, entitled to respect, needing, it may be, light and direction, but too sacred to be ignored. To surrender them is to fling away that which is most precious in man. In the depths of the spirit religion has its birth. It is a flame kindled in the soul by its divine Author.

Keeping in mind that the grounds of faith are in the connection of the subjective and objective manifestations of God, each throwing light upon the other and each serving to corroborate the other, we may glance at certain leading proofs of theism which thus address us from without.

Nature is pervaded by an intellectual element. That nature is intelligible is the prime assumption in all study of natural phenomena. As Professor Huxley remarks, in substance, at the beginning of a recent essay on the progress of science in the last half-century, to discern the rationality of nature is the comprehensive aim of science. This affinity of nature with our own minds, this mind in nature, implies an intelligent author of nature. It is *possible* to conclude otherwise, but not reasonable or natural.

Materialistic atheism must begin with the impossible task of resolving the human mind into a machine, and identifying consciousness and thought with the molecular movements of the brain. It must build a bridge which can never be built. The doctrine of the conservation of energy affords no help in this direction. Clerk Maxwell, one of its most authoritative ex-

pounders, says: "There is action and reaction between body and soul, but it is not of a kind in which energy passes from one to the other—as, when a man pulls a trigger, it is the gunpowder that projects the bullet, or when a pointsman shunts a train, it is the rails that bear the thrust." "The conservation of energy, when applied to living beings, leads to the conclusion that the soul of an animal is not, like the mainspring of a watch, the motive power of the body, but that its function is rather that of a steersman of a vessel—not to produce, but to regulate and direct the animal powers."

No modern discoveries have weakened the force of the argument from design, which in all ages has impressed alike the philosopher and the peasant. Evolution is a method, not a cause. It does nothing to account for the origin of things or the energy exerted in all progressive development. "It is plain," says Mr. Sully, "that every doctrine of evolution must assume some definite initial arrangement, which is supposed to contain the possibilities of the order which we find to be evolved, and no other possibility." Until that initial arrangement, involving all that issues out of it, is accounted for, not a step is taken towards explaining the world. The outcome of all the past history of nature is undeniably an orderly system—a cosmos. To introduce an element of "chance" in the succession of steps leading to it is a philosophical absurdity. Such a meaningless notion might seem to be countenanced in the terms used to describe the promiscuous variation which was a part of Mr. Darwin's theory. But even Mr. Darwin had no thought of denying that there are *laws* of variability. "Our ignorance," he says, "of the laws of variation is profound." This, of course, implies that there are such laws. The constitution of the being that varies is an essential factor, and, with Mr. Darwin, the prime factor in producing the variations which constitute the materials on which the so-called selective agency of nature acts. But according to many evolutionists, like Asa Gray, variation moves along definite lines and its range is limited. If this were not the fact, as the physiologist Dr. W. B. Carpenter cogently argues, the chances to be overcome in building up an organized species are infinite. "On the hypothesis of 'natural selection' among aimless variations," says Dr. Carpenter, "I think that it could be shown that the probability is infinitely small that the progressive modifications required in the structure of each individual organ to convert a reptile into a bird could have taken place without disturbing the required harmony in their combined action; nothing but intentional variations being competent to bring such a result." The proof of this pre-arrangement is furnished

"by the orderly sequence of variations following definite lines of advance. The evidence of final causes is not impaired. 'We simply,' to use the language of Whewell, 'transfer the notion of design and end from the region of facts to that of laws'; that is, from the particular cases to the general plan. In this general plan the production of man is comprehended. In him, the final product, the meaning and aim of the entire scheme of creation are fully discovered."

There are naturalists, among them Mr. Wallace, who are in more full accord with Darwin's particular view, and ascribe more to "natural selection." Generally speaking, even these are not so rash as to undertake to rule out teleology, and to explain the phenomena of vegetable and animal life on a mechanical theory which excludes design. How inadequate the mechanical view is, regarded as an explanation of nature, has been demonstrated by Lotze and other philosophers, who are not in the least averse to the doctrine of a genetic relation of animal species to one another, or even to a wider extension of evolutionary theory. It is easy for naturalists to become absorbed in the search after the links of causal connection which bind together the phenomena of nature. There is an exposure, the antipode of that false use of the idea of final causes which stifled inductive investigation, and against which Bacon protested. But even to naturalists of the present day, who are chargeable with this error, the teleological aspect of nature, the design that runs through all, will at times come home with an irresistible force of impression. Darwin is himself an example. The Duke of Argyll, speaking of the phenomena of nature, which "our mind recognizes as mental," writes as follows: "I have the best reason to know that Darwin himself was very far from being insensible to the evidence of this truth. In the year preceding his death he did me the honor to call upon me in London; and in the course of our conversation, I said to him that to me it seemed wholly impossible to separate many of the adjustments which he had so laboriously traced and described to any other agency than that of mind. His reply was one which has left an ineffaceable impression upon me; not from its words only, but from the tone and manner in which it was given. 'Well,' he said, 'that impression has often come upon me with overpowering force. But then, at other times, it all seems —'; and then he passed his hands across his eyes, as if to indicate the passing of a vision out of sight."

The admission of a first cause — that is, of a cause which is not itself an effect — is unavoidable unless the principle of causation is to be utterly discredited. The agnostic theory of an

"Unknowable" is self-destructive. To ascribe to the infinite being *power* is open to whatever objection is imagined to lie against the ascription to that being of intelligence. It is assumed that there is a revelation of *power*: because of this revelation the existence of that being is assumed. But the revelation of *intelligence* is every whit as clear.

How shall we be assured of the moral attributes of God, of his holiness and love? We are in a world that abounds in suffering. How shall this be reconciled with benevolence in the Creator? Much weight is to be given to the consideration of the effects flowing of necessity from a system of general laws, notwithstanding the advantages of such a system. The suggestions relative to the occasions and beneficent offices of pain and death, which are presented by such writers as James Martineau, in his recent work, "A Study of Religion," are helpful. Especially is the fact of moral evil to be taken into the account when a solution is sought for the problem of physical evil, its concomitant and so often its consequence. Let it be freely granted, however, that no explanations that man can devise avail to clear up altogether the mystery of evil. It is only a small part of the system of things that falls under our observation in the present stage of our being. It is not by an inductive argument, by showing a preponderance of good over evil in the arrangements of nature, that the mind is set at rest. There is no need of an argument of this kind. There is need of faith, but that faith is rational. We find in our own moral constitution a direct and full attestation of the goodness of God. Our moral constitution is affirmed, by a class of evolutionists, to be a gradual growth from a foundation of animal instincts. Let this speculation go for what it may be worth. The same theory is advanced respecting the human intellect. Yet the intellect is assumed to be an organ of knowledge. There is no avoiding this conclusion; else all science, evolutionary science included, is a castle in the air. If the intellect is entitled to trust, so equally is the moral nature. Are the righteousness and goodness of God called in question on the ground of perplexing facts observed in the structure and course of the world? Where do we get the qualifications for raising such inquiries or rendering an answer to them? It must be from ideals of character which we find within ourselves, and from the supreme place accorded to the moral law which is written on the heart. But whence come these moral ideals? Who enthroned the law of righteousness in the heart? Who inscribed on the tablets of the soul the assertion of the inviolable authority of right and the absolute worth of love as a motive of action? In a

word, our moral constitution is itself given us of God, and if it be not the reflection of his character, it is, for aught we can say, a false light; in which case all the verdicts resting upon it, with all the queries of skepticism as to the goodness of God, may be illusive. The arraignment of the character of God on the ground of alleged imperfections in nature, or of seemingly harsh and unjust occurrences in the course of events, is therefore suicidal. The revelation of God's character is in our moral constitution. The voice within us, which is uttered in the sacred impulse of duty and in the law of love, is his voice. There we learn what he approves, what he requires, what he rewards. When this proposition is denied, we lose our footing. We cut away the ground for trust in our own capacity for moral criticism.

Man has not one originating cause and the world another. The existence and supreme authority of conscience imply that in the ongoing of the world righteousness holds sway. If there is a moral purpose underlying the course of things, then a righteous being is at the helm. What confusion, worse than chaos, in the idea that while man himself is bound to be actuated by a moral purpose, the universe in which he is to act his part exists for no moral end, and that through the course of things no moral purpose runs!

It is not my object in these remarks to draw out in full the proofs of the existence and the moral attributes of God. It is rather to illustrate the relation in which these proofs stand to those perceptions, inchoate and spontaneous in the experiences of the soul, which are the ultimate subjective source of religion, and on which the living appreciation of the revelation of God in external nature is contingent. Let it be observed, moreover, that these native spiritual experiences of dependence, of obligation, and accountableness, of hunger for fellowship with the Infinite One, wherein religion takes its rise and has its root, are themselves to be counted as proofs of the reality of the object implied in them. They are significant of the end for which man was made. They presuppose God.

It is true that all our knowledge rests ultimately on an act of faith which finds no warrant in any process of reasoning. We cannot climb to this trust on the steps of a syllogism. We are obliged to start with a confidence in the veracity of our intellectual faculties; and this we have to assume persistently in the whole work of acquiring knowledge. Without this assumption we can no more infer anything or know anything than a bird can fly in a vacuum. All science reposes on this faith in our own minds, which implies and includes faith in the Author of the mind. This primitive faith in our-

selves is moral in its nature. So of all that truth which is justly called self-evident. No arguments are to be adduced for it. In every process of reasoning it is presupposed. We can prove nothing except on the basis of propositions that admit of no proof. But if we leave out of account the domain of self-evident truth, which is ground common to both religion and science, religious beliefs, as far as they are sound, are based on adequate evidence. It may be well, however, to explain somewhat more definitely what is denoted by faith; to say enough, at least, to guard against certain misconceptions. At the opening of one of the noblest passages in the New Testament, faith is defined as "the substance of things hoped for, the evidence of things not seen." A more correct rendering of the verse would be, "The firm assurance of things hoped for, the being convinced of things not seen"—that is, of their reality. Faith makes real to the mind objects of hope; things in the future; it makes real, also, things not cognizable by the senses. It takes these things out of a kind of dream-land; and, further, it gives to them a substantial being, so that they exercise a due control in the shaping of conduct.

It is superfluous to remark that faith creates nothing; makes nothing different from what it is already. This is evident of that sort of faith which is exercised in relation to mundane affairs. I believe in the virtue of a medicine; but, if my faith is well founded, the virtue is in the medicine quite independently of any idea or feeling of mine in regard to it. I believe in a physician; but my belief does not give him the knowledge and the tact in which I confide. He is just the same—just as competent, or incompetent, as the case may be—whether I trust in him or not. Or, take for an illustration the faith of a discoverer. Columbus believed that he could reach a continent by sailing westward on a path which Europeans had never taken. His faith urged him onward, week after week, and month after month, never turning his prow, regardless of the discontent of his men, until faith was rewarded by sight. He descried at last the green shores and heard the singing of the birds. The poet Schiller, indeed, referring to the ardor of his faith, says that had Columbus not found a continent he would have created one. In truth, if he had not found the land, had there been no real object answering to his belief, his faith would have been merely a fancy.

It is equally obvious that nothing is added to the sum of religious truth by believing in it; nothing is subtracted by indifference or disbelief. As well might one think of creating or destroying the visible universe by opening or shutting the organ of vision. When a per-

son comes to believe in God, he adds not a single quality to the nature of that being with whom "is no variableness, neither shadow of turning." He simply discerns that which he had failed to see before: he finds God. No one imagines that the Prodigal Son created his father by returning to him. The forsaken father was always there, waiting for him. Faith in the gospel is simply the practical acknowledgment of a fact. The Apostle Paul reminds his readers that they have not to climb into heaven and bring Christ down, or to descend into the grave and bring him up. He has already lived among men, and he has risen. The victory of Jesus Christ over sin and over death is a finished achievement. Faith is that recognition of the fact which carries in it appropriate fruits in feeling and conduct. No one has understood better what faith is than Martin Luther, himself a great believer. "By faith," says Luther, "man sees into the heart of God." "God," says Luther, "is the God of the humble, the miserable, the afflicted, the oppressed, and the desperate, and of those that are brought even to nothing; and his nature is to exalt the humble, to feed the hungry, to give sight to the blind, to comfort the miserable, the afflicted, the bruised, the broken-hearted, to justify sinners, to quicken the dead, and to save the very desperate and damned. For he is an almighty Creator, and maketh all things of nothing."

Luther was not wrong in considering that the one essential thing in religion is faith. For without faith there is no real approach to God; and what is religion but converse or communion with God? Religion is a relation of person to person. The reveries of Pantheism are not religion in the proper sense of the word. He that cometh to God must believe that he is, and that he is the rewarder of those who seek after him. To speak to a being in whose existence one has no belief is little short of lunacy. To pour out gratitude, or to address a petition, to something held to be void of consciousness, incapable of hearing, is to bid farewell to common sense. So of the character of God; it has no practical influence on a man's thoughts or conduct except as he believes in it. Luther, moreover, was right, and only followed the Scriptures when he insisted that the source of all wrong-doing as well as of irreligion is the lack of faith. If men believed in God and in a hereafter as truly and as vividly as they believe in the reality of material things around them, temptations would be stripped of their power, sinful pleasure would have no chance as a rival of the higher good. Men sin because they mistake shadow for substance, and substance for shadow. They deify creatures of God, believing in them with an

idoltrous faith. Not seeing them in contrast with an equally clear view of things of imperishable value, they magnify their worth. They are drawn to them by an irresistible attraction, because they are cut off from the influence of the counter-force. They seek to slake the thirst of the spirit for the moment, striving to forget that "whosoever drinketh of this water shall thirst again."

We started with the thesis that the truths of religion rest upon good and sufficient evidence. Comparing these truths with well-grounded beliefs of a different species, where the things believed are within the circle of every-day life, we shall find that the first difference is in the *kind* of proofs presented, not in the comparative degree of weight that belongs to them in the two cases. As regards religious truth the proofs are not experimental. We cannot apply to them the tests of the measuring-rod and the crucible, and other criteria, of a tangible kind, which appeal to the senses. The evidence is, to say the least, equally weighty, but is not of the same sort. Among recent theological writers no one has set forth this not unfamiliar distinction with more force and originality than Mozley. Even in astronomy, not only is the reasoning in great part of a demonstrative kind, being mathematical in its nature, but it has the advantage of being verified by the observed fulfillment of prediction. The eclipse draws a curtain over the disk of the sun at the very moment set down in the almanac. The comet makes its appearance, fulfilling with absolute punctuality a prophecy recorded centuries before. It may be doubted whether astronomical truth—truth so amazing and almost bewildering in its nature—would gain the assent of the common mind were it not verified to everybody in this visible and astonishing way. Now the only thing in religion analogous to these external tests is the miracle, including prophecy, which is one form of miracle. The miracle is a sign, a kind of experimental proof, an appeal to the senses as an aid to faith. Jesus wrought miracles only where there was already a germinant faith. He said to Thomas, "Blessed are they that have not seen, and yet have believed." Jesus manifested himself to the senses of the doubting disciple and that disciple believed. It is a higher thing to believe when there is nothing but testimony, and when the internal probability of the fact is thrown into the scale and avails to carry the mind's assent.

It is therefore an error, either undesigned or intentional, of skeptical writers to describe faith as an arbitrary, groundless acceptance of doctrines in behalf of which no proof is possible. This is to confound faith and credulity. It makes religion the equivalent of superstition. Mon-

taigne, in his "Essays," in his genial way of avoiding whatever might give offense or raise a dispute, affords an example of this practice of relegating faith to a province quite apart from reason. The open rejection of religious truth is avoided by this urbane method of remanding the creed to a department where it is presumptuous for plain mortals to intrude. Hume, in his "Essays," Gibbon, in his history, following a common practice of freethinkers in the last century, in an ironical or sarcastic vein, not unfrequently refer to faith as something too sacred to rest on proof. Thus religious beliefs are made to appear to hang in mid-air, without any support. But the foundation of these beliefs is no less solid for the reason that empirical tests are not applicable to them. The data on which they rest are real, and the inferences from the data are fairly drawn.

The first peculiarity of the truth accepted by faith is, then, the absence of the external or experimental sort of proof in confirmation of it. In addition to this peculiarity, the truths of religion, while they are of the character just described, summon the mind to a forth-putting of energy in an extraordinary degree. An exertion of will is requisite. Take the fundamental truth of religion, the existence of a personal God. The proofs of the being of God are so strong that they would suffice to produce conviction in every reasonable mind if the proposition were not one so amazing in its nature. To accept it and rest in it requires a certain energy of trust. "This principle of trust," says Mozley, "is faith — the same principle by which we repose in a witness of good character who informs us of a marvelous occurrence — so marvelous that the trust in his testimony has to be sustained by a certain effort of the reasonable will." The timidity of reason has to be overcome by a courageous exercise of will. In appropriating, or making our own, the things of faith, there is a venture to be made on the ground of the evidence, without the stimulus and support of an appeal to the senses. In matters of the highest moment, which affect our destiny, we have to go upon trust; a reasonable trust, to be sure, yet requiring to be maintained even in the face of impressions, seemingly adverse to it, which come in through the senses. Now, unless the phenomena which are the reasonable ground of faith, and which pertain on the one side to our moral and spiritual experience, are vividly apprehended, the soul will be too timid to make the venture. The stake is too great, the issue too momentous. We are called upon to take a leap in the dark, without seeing what our feet are to touch. There is proof enough, but there is a seeming conflict with the senses. The elements of uncertainty are at once exaggerated. Courage

gives way. Many people are afraid in the dark, out of doors and in their own homes, even when they know that there is no rational ground for apprehension. Infidelity is a species of cowardice.

In a charming passage of the *Phædo*, Socrates, after much wise talk about the future life, says: "To affirm positively that all is exactly as I have described would not befit a man of sense. But, since the soul is evidently immortal, that this or something like it is true of our souls and their future habitations — this I think it does befit him to believe, and it is worth risking his faith upon, for the risk is a glorious one indeed." And then, later, when Crito inquires, "How do you wish us to bury you?" "Just as you please," he answered, "if you only get hold of me and do not let me escape you." And quietly laughing and glancing at us, he said: "I cannot persuade Crito, my friends, that this Socrates who is now talking with you and laying down each one of these propositions is my very self; for his mind is full of the thought that I am he whom he is to see in a little while as a corpse; and so he asks how he shall bury me."

The eleventh chapter of *Hebrews* enumerates a list of heroes of faith — Abraham, Moses, and the others. Their faith nerved them to risk everything without fear as to the result. It was not an irrational confidence. Had it been a groundless trust, their bravery would have been mere foolhardiness. Their distinction was that they had the energy to act upon an expectation which, though reasonable in its character, ran counter to all the appearances. Not without truth has it been said of heroism in general, that it partakes of a supernatural quality.

A number of years ago I read an account of a visit made by the Prince of Wales, in company with an eminent man of science, to a great iron foundry. They stood together by a stream of red-hot iron, flowing slowly out of the smelting furnace. "Do you believe in science?" said his companion to the Prince. "I do," was the reply. "Then thrust your moistened finger into that stream." The Prince at once divided the stream with his finger, and the finger was not harmed. Whether this particular incident occurred or not, the same thing is not unfrequently done by workmen in foundries. On the instant of the contact of the hand with the fiery liquid there ensues what the scientific men call the "spheroidal state." The sudden evaporation is somehow attended by a repellency that perfectly shields the flesh, for the moment, from contact with the burning substance through which it passes. A learned professor has related to me that having had occasion to refer, in a popular lecture, to the principle of the spheroidal state, and to ex-

plain how a stream of molten iron could be thus parted by the naked hand with impunity, a lad among his hearers informed him that his father, a workman in a foundry near by, had often done it. The lecturer repaired to the place, and the workman repeated the experiment in his presence, but, in reply to an inquiry, informed him that the other workmen were afraid to do it. The professor to whom I refer has more than once cut with his finger the glowing stream as it flowed out in a slow current from the heated furnace.

We may suppose a person to understand the principle of the spheroidal state, and how it is that the hand, with only the ordinary amount of natural moisture upon it, can be safely passed through such a current. Nevertheless, he might shrink from making the experiment. The sight of the red-hot liquid might induce a recoil which his faith in the principle would not suffice to overcome. Even in the case to which I have referred, the workmen who saw one of their companions try the experiment again and again were kept back by a certain timidity from following his example. An unwonted energy, an unwonted boldness, are requisite to neutralize the impression made on the mind through the senses, let reason say what it will.

It follows that there are grades of faith. We read in the Gospel of Mark that a father who had brought his poor diseased child to Christ "said with tears, 'Lord, I believe; help thou mine unbelief.'" The Evangelist Luke records the fact that the disciples of Jesus came to him with the prayer, "Increase our faith." The petition implies that there is a difficulty in believing. Many Christian disciples of later times have found it to be so, both in respect to that general faith in God's presence, power, and love which the Apostles then had specially in mind, and in respect to trust in the revelation of his mercy through Christ. Where there is intellectual assent, another element must be mixed with it to constitute faith. Why do we not *feel* that God is near us and with us; that not a sparrow falls to the ground without him; that he really pities and cares for us; that he will provide for us; that he loves us even when he makes us suffer; that he can make all things which occur to work together for our good; that nations, like individuals, are in his hand? Why do we not feel that if we are stripped of all earthly good, he can more than make up the loss to us; that in his favor there is life in the highest sense — true joy? In a word — why is not God more real to us? How near is the power on which we depend for life and breath and all things! How narrow, after all, is the space that is open to the action of our wills! Its boundaries are close upon us, and

on every side is God! The place and time of our birth, our personal characteristics, the outward circumstances of our life, the results of our plans and endeavors, the length of our days, all — save the limited effects left contingent upon our choice — are determined by God. Man proposes, but God disposes. He is without us, ordering the course of events. He is within, speaking through conscience. He hems us in on every side, and confronts us at every turn. Why should he be to us as if he were not?

No doubt the considerations already brought forward may suggest a partial answer to the question. We live in a world of sense and the world of sense abides with us, early and late. We live in the midst of things seen and temporal. The material aspect of human existence is constantly before us. On every hand is the appalling spectacle of human decay and death. The generations come and go — carried away "as by a flood." After all, however, this explanation of the dullness of faith appears inadequate. It does not go to the root. We believe in a thousand things that we do not see. The past history of the world I did not myself witness. I believe in the existence of a million stars which I have never beheld. But these, it may be said, are in their own nature visible. But heat is invisible; the force of gravity is invisible. Yet we believe in these. We believe that the men and women about us have souls, although we have never seen them, nor are they capable of being seen; for

We are spirits clad in veils,
Man by man was never seen;
All our deep communing fails
To remove the shadowy screen.

Why should the visible scene around us intercept the view of God instead of manifesting him? When we look within, when in a truthful spirit we inquire before the bar of our own judgment in what spirit we have lived, and when we contemplate mankind earnestly, in their present condition and their past history, we have to confess that human nature is afflicted with a malady; which yet is not properly called a malady, since men accuse themselves and blame themselves on account of it and on account of the multiform types of wrong-doing that spring out of it, as fruits from a tree. We may leave it, if we choose, to philosophers and to theologians to discuss the origin of sin, how it spread, and the grounds of personal responsibility for it. Of the fact of sin there can be no question. In one of Professor Huxley's recent excursions into the field of theology he drops for a moment from his usually confident and almost hilarious mood into a more pensive strain. I quote the para-

graph, printing, however, two or three words in a type that will call to them special attention :

I know no study which is so unutterably saddening as that of the evolution of humanity as it is set forth in the annals of history. Out of the darkness of prehistoric ages man emerges with the marks of his lowly origin strong upon him. He is a brute only more intelligent than the other brutes ; a blind prey to impulses, which as often as not lead him to destruction ; a victim to endless illusions, which make his mental existence a terror and a burden and fill his physical life with barren toil and battle. He retains a degree of physical comfort, and develops a more or less workable theory of life, in such favorable situations as the plains of Mesopotamia and of Egypt, and then, for thousands and thousands of years, struggles with varying fortunes, attended by INFINITE WICKEDNESS, bloodshed, and misery, to maintain himself at this point against the greed and the ambition of his fellow-men. He makes a point of killing and otherwise persecuting all those who first try to get him to move on ; and when he has moved on a step, foolishly confers post-mortem deification on his victims. He exactly repeats the process with all who want to step yet farther. And the best men of the best epochs are simply those who make the fewest blunders and commit the fewest sins.

How much truth there is in this vivid picture of the past of mankind is plain to all thoughtful persons. What is worthy of note is that along with what is said of the "evolution of humanity," and notwithstanding the apparent sanction given to that unproved type of evolutionary theory which makes man at the start nothing but an intelligent brute, there is still a perception that his career is something more than a chapter in natural history. That is, moral history is not completely metamorphosed into natural history. There has been "INFINITE WICKEDNESS." Nay, more ; the most that can be claimed for the "best" of men is that they "commit the fewest sins." Has the brilliant naturalist ever pondered what is involved in these unquestioned facts ? Has he ever grasped them in their full purport, and sought to understand what they presuppose respecting the race of mankind ? Is he wise enough to be sure that the solution of them in the Scriptures, and the Christian explanation of the radical source of the "bloodshed and misery," the "greed and the ambition," the "endless illusions" on which he dwells so pathetically, is not, after all, the most philosophical and satisfactory of all solutions ? Grant that sin, in its origin and diffusion, and the union of individual responsibility and guilt with a common moral depravity coextensive with the race, involves mystery. May it not be, as Coleridge has said, the one mystery that makes all things else clear ? Grant that even when sin is perceived to be the root of misery, it is hard fully to explain the slowness of the divine

process of recovery and redemption, yet the gravest difficulty is taken out of the way. A dark shadow is removed from the character of God and his administration.

The paragraph which I have quoted from Professor Huxley recalls a striking passage from the pen of a most gifted man, but a man quite different in the cast of his thoughts from the distinguished naturalist. The passage which follows is extracted from the "Apologia" of John Henry Newman. After speaking of the certainty which he has of the being of God, on the ground of the inward testimonies of heart and conscience, he adds :

Were it not for this voice, speaking so clearly in my conscience and my heart, I should be an atheist, or a pantheist, or a polytheist when I looked into the world. I am speaking for myself only ; and I am far from denying the real force of the arguments in proof of a God drawn from the general facts of human society ; but these do not warm me or enlighten me ; they do not take away the winter of my desolation, or make the buds unfold and the leaves grow within me, and my moral being rejoice. The sight of the world is nothing else than the prophet's scroll, full of "lamentations and mourning and woe."

To consider the world in its length and breadth, the many races of man, their starts, their fortunes, their mutual alienations, their conflicts ; . . . the greatness and littleness of man, his far-reaching aims, his short duration, the curtain hung over his futurity ; the disappointments of life, the defeat of good, the success of evil, physical pain, moral anguish, the prevalence and intensity of sin, the pervading idolatries ; the dreary, hopeless irreligion, that condition of the whole race, so perfectly yet exactly described in the Apostle's words (having no hope and without God in the world) — all this is a vision to dizzy and appal ; and inflicts upon the mind the sense of a profound mystery, which is absolutely beyond human solution.

What shall be said to this heart-piercing, reason-bewildering fact ? . . . Did I see a boy of good make and mind, with the tokens on him of a refined nature, cast upon the world without provision, unable to say whence he came, his birthplace, his family connections, I should conclude that there was some mystery connected with his history, and that he was one of whom, from one cause or other, his parents were ashamed. . . . And so I argue about the world ; if there be a God, since there is a God, the human race is implicated in some terrible aboriginal calamity. It is out of joint with the purposes of its Creator. This is a fact ; a fact as true as the fact of its existence ; and thus the doctrine of what is theologically called original sin becomes to me almost as certain as that the world exists, and as the existence of God.

I have not quoted the whole of these impressive paragraphs of Newman, but I have quoted enough to show the points of strong resemblance between this description of the feelings excited by a calm survey of men and their history, and that given in the citation

from Professor Huxley. If Newman inserts in the dark catalogue "the prevalence and intensity of sin," the phrase is equivalent to the "infinite wickedness," the contemplation of which saddens the mind of Huxley. But the difference is that the theologian does not suffer that most terrible fact of evil involving guilt, which exhibits itself everywhere in human history — a fact in its very nature abnormal; the abnormal character of which cannot be denied without a denial of the fact itself — to be lightly passed by. He sees in it, in the universality of transgression, proof that in some inscrutable way the race has made shipwreck of itself. There is a source — however incapable it may be of full explication — of this corruption, which, be it never forgotten, is not physical, but is moral and culpable. There must be a *fons et origo malorum*. Writers of the class of Professor Huxley can see and acknowledge the "infinite wickedness" of the world, and designate it by its right name. They can see that the only merit of "the best men of the best epochs" is that they "commit the fewest sins." They call them "sins" and distinguish them from "blunders." They confess with pain that immoralities and crimes make up a great part of the annals of mankind. Theorizing about "the evolution of humanity" has to reconcile itself, somehow or other, with human responsibility and with the appalling moral depravity which has spread over the race. It is seen clearly enough that to seek to turn, by any hocus-pocus of speculation, whether physical or metaphysical, evil into good, to transmute sin into something not base or blameworthy, is to undertake to paralyze conscience and to undermine the moral basis of society. So here remains the awful fact of sin, and of a common sin, or of sin that is common. Here is the fact which Professor Huxley terms the "*infinite wickedness*" that is and has been in the world since men began to exist in it. Here is the reason why Professor Huxley, and every other man who honestly goes through an act of self-judgment, is obliged to bow his head like the publican in the parable.

Sin being an undeniable fact, and being in its nature an element of disorder, that our perception of God and of things spiritual should be to a certain degree darkened by the perversion of the will in its inmost inclination, by the "infinite wickedness" which Professor Huxley deplores, and of which he truly says that the "best men of the best epochs" partake, is what might naturally be expected.

Light is thus thrown on the psychology of doubt and disbelief. We have to take account of the fact that we have fallen into a habit of mind discordant with our nature, — that better nature which is affiliated to God, — and one

effect of this perversion is to obscure the discernment of things supernatural. The life of self which we lead, and which Christ under took to destroy, — the habit of living to the world and of placing our chief good, and seeking the satisfaction of the spirit, within the bounds of created nature, — is the radical source of unbelief. We have not liked to retain God in our knowledge. Herschel remarks of the cosmic system as revealed by astronomy, that it is directly opposed to the ordinary conception of men. To them the earth is the center; the sun moves in a circle around it; the starry heavens are a canopy stretched over it. Science contradicts and upsets this natural view of things. But not more than the truth of religion subverts that habit of thought in which the soul is self-centered and the world is looked upon as tributary to its gratification. It is a dictum of common sense, as well as a word of the Lord, that the heart will be where its treasure is. Can it be considered strange that the course of our mental life — the currents of thought and feeling — should be adjusted to the natural order within which, exclusively, our affections find their chosen objects, and above which our desires and aspirations do not rise? The laws of association by which the process of our thoughts is determined keep the attention upon the object of the heart's love. As to all that lies beyond, the vividness of our ideas, and, eventually, even our beliefs, are subject to the same influence. The perceptions that engender faith are wanting. The sense of dependence, humility in the room of self-assertion, the craving for something higher than earthly good, the sharp rebukes of conscience, are absent. Faith is a plant that cannot spring up in so barren a soil. One might as well hope to impart science to one void of curiosity and without any true sense of the value of knowledge. Receptivity of one kind or another is the door of access for all higher good.

If there be such a hindrance to the exercise of faith in general, a peculiar obstacle interferes with trust in the revelation of the love of God in the religion of the gospel. In this branch of the discussion it is pertinent to refer to the well-known phenomena of Christian experience. There is an abundance of testimony, in the history of the Church and in Christian biography, to sustain the remarks which are to follow. To facts of this nature the class whom Newman somewhere denominates "mere men of letters" may think it beneath them to attend. Not so will judge wise and candid students of human nature, be their creed what it may.

It often happens that when the habit of worldliness is partly broken up, and self-reproach is awakened, the feeling of unworthiness makes it hard to look upon God in any

other light than that of a judge. Like Luther, in his earlier days, we are inclined to think of Christ as having come into the world to condemn rather than to save. He seems to be a second Moses; only tenfold more rigid and austere than the first. We read the Sermon on the Mount, and find no difficulty in believing what he says of the rigor of the law, the ideal of obligation—penetrating to the inmost thought of the heart—finding in unrighteous anger the seed-principle of murder. We believe all this; but we do not so easily believe in the assurance that he is meek and lowly in heart; that “the bruised reed he will not break.” The invitation to come unto him and find rest is heard with a kind of distrust. There is a common saying that it is hard to forgive those whom we have injured. Certainly we are apt to imagine them to feel unkindly towards us. A sense of ill-desert banishes men from God the more effectually because they know it to be a true and right feeling, and know that if they condemn their sin God condemns it even more. Such is the effect of the moral ideal, brought within the pale of consciousness. But the law reveals man to himself; it does not reveal God to man save partially and in one relation. He is more than law and justice and holiness. There is a mercifulness deeper than all. He loves his enemies; and we are exhorted in the Sermon on the Mount to copy his example by doing good to those who treat us ill. “God commendeth his love toward us, in that, while we were yet sinners, Christ died for us.” Yet, notwithstanding this manifestation of the love of God, and of his willingness to forgive the ill-deserving, the sense of guilt and of shame at the lives we have led may hinder us from believing in him. The Prodigal Son, when he resolved to go back to his father, only thought to apply for the place of a servant. “Make me as one of thy hired servants,” that should be his prayer. That was the extent of his hope. But when, weary, footsore, and famished, he caught sight of his father, hastening to meet him, and saw that his heart was full of love and pity, he forgot this part of his intended petition. He did not beg to be made a servant. All his dread was dispelled.

Now that we have glanced at the principal hindrances in the way of believing, it will not be wandering from our subject to inquire by what means faith may be increased.

Not by the mere exercise of the understanding—the inquisitive and reasoning faculty. The understanding, it has been all along implied, has its rights in matters of religion. We cannot be required to believe anything in conflict with the dictates of sound reason. But when men talk of reason and of a supposed conflict between Christianity and reason, it is impor-

tant to inquire what precisely is signified by the term. Whose reason is meant? Is it the reason of an immature mind? Is it reason warped by prejudice, heated by passion, or blinded by conceit and self-admiration? A conflict between reason as thus described and the Christian system is of no significance in opposition to the latter. When we speak of the accordance of Christianity with reason, we mean the reason of a right-minded man whose intellectual vision is purified. We mean reason regenerated. The Christian cause need not shrink from answering to a tribunal thus qualified for passing judgment. In the case of an historical religion like Christianity we have a right to examine the testimony to the facts offered to our credence. To attribute all sorts of doubt and questioning to an evil heart is quite unwarrantable. To condemn dissent from the tenets or interpretations of a particular sect or school, as if it were infallible, is arrogant. At the same time our convictions of religious truth do not take their rise in the understanding. Define it as you will, there is such a thing as spiritual discernment. A quickened receptivity develops an insight analogous to higher perceptions in the domain of poetry and art. There are truths which shine in their own light. They impress the soul directly with the evidence of their reality. They will sometimes flash on the mind after long waiting and fruitless groping in the dark. Christ did not say: Blessed are men of talents; blessed are those who have the ability and leisure for investigation; blessed are the keen logicians. But he said: “Blessed are the poor in spirit”; “Blessed are the pure in heart”; “Blessed are they that hunger and thirst after righteousness.” He took a little child, and placed him in the midst of his Disciples, as an example of the humility required for admission into his kingdom. His first followers were not distinguished for their intellectual powers. They were unlearned men. It is found in these days, not unfrequently, that men eminent for their intellectual powers and acquirements are unbelievers. Numerous examples, to be sure, of faith on the part of men equally eminent, men like Kepler, Leibnitz, Newton, Faraday, are not wanting. But apart from numerous examples of the power of Christianity to convince the most powerful minds, no Christian believer has any occasion to be disquieted for the reason that men excelling in science or scholarship stand aloof from the gospel, or even if they profess atheism. If the secret of unbelief, or its inmost source, be the alienation of the heart from God, what is there in mere intellectual culture to furnish a remedy? A man may not be cured of a moral distemper by getting knowledge, any more than by getting fame, or getting money.

Two things are to be borne in mind. In the first place, there is abundant evidence that an awakening of conscience, or a quickening of moral sensibility in any form, will often dissipate doubt, and create an inward assurance in another way than by the solving of intellectual problems. It is frequently seen, also, that the understanding, even when its path is made smooth, its difficulties cleared up, its hard questions answered, does not engender faith. A negative work is accomplished, but perhaps nothing more. The bark is all ready to move on the waters, the sails are spread, but there is no breeze to fill them. To break through the bonds of nature, and lay hold of the supernatural — that all our reasonings do not lend us the power to do. Fetters have been shaken off which held us to the earth, but no wings have been given on which to soar aloft. Light has come, but not life.

Logic alone cannot develop faith. But more is to be hoped from that kind of thoughtfulness which tends to detach the heart from earthly good. He who learns how insufficient the world is for the soul will be prepared to turn to something higher. For this reason, in a multitude of instances, trouble has proved to be a school of faith. One who has trusted in riches, but who is despoiled of them and reduced to poverty, looks about for something more substantial to rest upon. One who has made a god of reputation, but becomes, either with or without his fault, unpopular and odious, or obscure and forgotten, is naturally prompted to seek for a good more satisfying and more lasting than the breath of human praise. How many have learned more of God in one hour of bitter sorrow, when bereaved of those who made a part of their life, than they had learned in years of study! They open the Bible, and hear there messages from the Unseen which before had fallen on listless ears. Bowed down with grief, they hear the sweet and majestic words, "He hath sent me to bind up the broken-hearted." When the light goes out on the hearthstone, when nothing meets the eye but tokens left behind by those gone from us, no more to return, then, perchance, we lift our eyes from the darkened earth, and lo! like the patriarch of old, we see the heavens radiant with stars not seen in the glare of day. Out of anguish that seemed unbearable, out of paroxysms of grief, out of the long hours of dull pain, are plucked fruits precious enough to outweigh the suffering which they cost. The soul is brought a little nearer to God. Saints there have been who have welcomed pain. Pascal prayed: "If the world filled up the affections of my heart while I was in bodily vigor, let that vigor be laid low if my spiritual good require it!" "Dispose of me altogether as thou

shalt see best! Replenish or impoverish me as thou wilt! But conform my will to thine; and enable me, in an humble and entire submission, and a holy confidence, to wait thy providential guidance, and to acquiesce in thy gracious disposal!"

It is sometimes made a reproach to religion that it is the refuge of the weak, the disappointed, the desponding. But the question is whether the realities of existence are not more truly discerned from the point of view gained by such — whether the mental vision is not clearer.

Not long after the death of his wife, Thomas Carlyle wrote to his friend Erskine of Linlathen as follows: "'Our Father which art in heaven, hallowed be thy name; thy kingdom come, thy will be done'—what else can we say? The other night, in my sleepless tossings about, which were growing more and more miserable, these words, that brief and grand prayer, came strangely into my mind, with an altogether new emphasis, as if written and shining for me in mild pure splendor on the black bosom of the night there; when I, as it were, read them, word by word, with a sudden check to my imperfect wanderings, with a sudden softness of composure that was most unexpected. Not perhaps for thirty or forty years had I ever formally repeated that prayer; nay, I never felt before how intensely the voice of man's soul it is; the inmost aspiration of all that is high and pious in poor human nature; right worthy to be recommended with an 'After this manner pray ye.'" How did Carlyle come to see what he had never seen before, and to feel what he had never before felt? Have the teachers of the Church in all ages been so far astray, when, following Christ and the Apostles, they have talked of a blindness of mind and of spiritual light?

Another effective mode of promoting faith is obedience, even if, owing to the dullness of the organ of hearing, one hears but faintly the voice of him who commands. With obedience there begins a rectification of the will, and a quickening of the power of discernment will follow. We are then steering by the right star, albeit we dimly perceive it. No man has any assurance that he will discover religious truth unless he has first made up his mind to live by it. It is ordained that we shall feel our way in religion. The truth of religion is bread for the hungry; we must "taste and see" that the Lord is good. Even more important is it to bear in mind that the gates of light are shut to him who is not bent upon walking in the light. "If any man will [or rather, willeth to] do His will, he shall know of the doctrine, whether it be of God, or whether I speak of myself."

Here not thinking, but doing, is made the road to knowledge.

Another means of increasing faith is the contemplation of Christ. Wherever men are to be lifted above the ordinary plane of character and achievement there is need of the inspiration of personal leadership. The history of every nation's deliverance from peril or from degradation illustrates this truth. The highest of all illustrations is afforded in Christianity. Christ came to draw men out of the life of unbelief into a fellowship with himself; a fellowship in his own spiritual life of communion with the Father. Here on earth he himself lived by faith. We are invited to look to him as the Author and Finisher of our faith. The word here rendered "Author" is the same as that which stands for "Captain" where he is called "the Captain of their salvation," and means both example and forerunner. He is the "Author" or forerunner in faith, since, by looking forward to the joy set before him, he endured the cross, despising the shame. His victory on the cross was by faith; a faith which he would fain impart to us. He replied to the Tempter that man does not live by bread alone, but by every word of God. He thanked the Father for choosing humble men to be his disciples, because it seemed good in the Father's sight. Faith upheld him in the garden when he said, "Nevertheless not as I will, but as thou wilt"; and on the cross when he said, "Father, into thy hands I commend my spirit." He is the vine, we are the branches. By looking to him we become partakers of his inward life; the life of faith as well as of holiness and peace. If his communion with God was a real thing and not a mockery and a delusion, then all that is presupposed in that communion is also real. He inspires with faith by his own example.

The last and principal means of deepening faith to be adverted to is prayer. The Disciples came to Jesus with the supplication, "Increase our faith." Mere thinking and striving will not avail. Christ thanked the Father for the faith of the Disciples, because it was the Father who had hidden these things from the wise and prudent and revealed them unto babes. Of Peter's fervent avowal of faith in him as the Son of God he said, "Flesh and blood hath not revealed it unto thee, but my Father which is in heaven." Whoever seeks to enliven his own faith, or the faith of others in whom he is interested, finds out by experiment that thought and argument and entreaty do not suffice. Light must come from the source of light. Nothing is left but to resort directly to God.

No help but prayer,
A breath that fleets beyond this vain world
And touches him that made it.

And here there is a well-founded assurance that none apply to God in vain. There is one prayer that may be offered with an absolute certainty that the very thing sought for will be granted. With respect to everything else, in our limited knowledge of what is best for us, we have to connect with each petition an acknowledgment of submission to the divine will and wisdom. We implore God to give—but to withhold, should it seem to him best. But to the prayer for the enlightening Spirit of God no proviso need be appended. The doctrine of a divine influence even the most enlightened heathen have found no difficulty in accepting. It is declared without qualification in the Scriptures that God is willing to give his Spirit to them who ask. We can apply to him, if there be in us faith enough to go to him at all, confident that we shall receive the very thing that we desire for ourselves. He can open the eyes of the blind. He can touch the soul with his own mysterious, life-giving Spirit, and quicken it to a perception of realities now dim and shadowy. He is willing to do that: "Ask, and it shall be given you; seek, and ye shall find; knock, and it shall be opened unto you." Whoever is baffled by mysteries that he cannot unravel, and confused by problems that he cannot solve, can approach God as a child, and ask the Father to teach him.

Poor Hartley Coleridge wrote these lines, out of a heart surcharged with suffering:

Be not afraid to pray—to pray is right.
Pray, if thou canst, with hope; but ever pray,
Though hope be weak or sick with long delay;
Pray in the darkness, if there be no light.

.

Pray to be perfect, though material heaven
Forbid the spirit so on earth to be;
But if for any wish thou darest not pray,
Then pray to God to cast that wish away.

The truly great poets are the profoundest preachers. These are words of Tennyson:

More things are wrought by prayer
Than this world dreams of. Wherefore, let thy
voice
Rise like a fountain for me night and day.
For what are men better than sheep or goats
That nourish a blind life within the brain,
If, knowing God, they lift not hands of prayer
Both for themselves and those who call them
friend?

George P. Fisher.

TOPICS OF THE TIME.

An Object Lesson in Municipal Government.

THERE is much to interest thoughtful Americans in the article upon the city of Glasgow and its government which we publish in this number of *THE CENTURY*. A graphic picture is given therein of a model municipality, ruled and guided by its highest intelligence and morality for the health and benefit of all its members. It is scarcely necessary to say that this method of government is diametrically opposite to that which prevails in the large cities of America. Municipal misrule in the United States is a byword the world over, chiefly because intelligence and morality as guiding forces give place to political chicanery, cupidity, and ignorance. Our cities are not ruled wisely and economically for the benefit of all their inhabitants, but unwisely and extravagantly for the benefit of the politicians and political organizations. We can hope for no municipal reform which shall be radical and lasting till we change our leadership to the European models.

Mr. Shaw gives the explanation of all the benefits which Glasgow has reaped from her many years of Town Council rule when he says early in his paper that the "councilors come chiefly from the ranks of men of business, and are upright, respected, and successful citizens"; that "party lines are seldom very sharply drawn in municipal elections"; and that "an efficient councilor may, in general, expect reelection for several terms if he is willing to serve." What American city would fail to prosper under the rule of a body of fifty of its citizens of like character? The Glasgow council of fifty have absolute control of all branches of the city government, the streets, water-supply, sanitary arrangements, police, fire department, markets, gas-supply, street railways—everything. They manage all upon strict business principles, with precisely the same results which competent business men everywhere secure in the management of their private concerns. The streets are cleaned every night, and the private courts of the thickly settled quarters are cleaned once and sometimes three times a day. The care and paving of the streets, the construction and regulation of sewers, and public construction of all kinds have been for forty years in charge of one of the most distinguished of British architects and civil engineers. The health department has for nearly or quite as long a period been in charge of an equally distinguished member of the medical profession. The clerk of the town, who occupies much the same position as city attorney or corporation counsel in an American city, has held the office for many years, and is a high authority upon all questions of municipal history and law. So it runs all through the municipal organization. From top to bottom there is intelligence and character in every party. The result is the model city which Mr. Shaw describes.

The primary results set forth by him are similar to those attained in other British cities, like Manchester and Birmingham, in which rule by Town Council has

proved so beneficial, and in Berlin, whose affairs are managed by a municipal assembly of 126 of its most eminent statesmen, scholars, and merchants. In each case the rights and welfare of the citizen are protected and advanced in every possible way. He has clean and well-paved streets, cheap gas, excellent public schools for his children, every precaution taken to preserve his health and that of his family, public libraries and picture galleries for his education and delight, perfect police protection at all hours of the day and night—all secured for him at the lowest possible cost. In fact, the poorest citizen of Glasgow, or Birmingham, or Manchester, or Berlin is as well guarded and his interests are as well protected as if the city were his club whose officers and servants had no other duty than to minister to his best welfare and comfort. His expenses are reduced in every direction; his burdens from taxation are put at the minimum point; his house-rent is not only thus reduced, but the character of his dwelling is improved at the public expense; and the streets are straightened and widened, also at the public expense, to give him better air and light.

The contrast is striking between this situation and that of the average inhabitant of an American city. The latter, instead of having all his rights protected, comes in most cases very near to being in the position of having no rights which the municipal authorities are willing to respect. He is ruled by ignorance and cupidity, and he pays heavily for this rule. There can be no relief till the character of the rulers can be changed, and how to secure that change has been a problem for discussion for many years and will continue to be for many more. Our greatest obstacle is the enormous influx of European immigration, which puts our proportion of ignorant voters immeasurably beyond that of any of the European cities whose model governments we have been considering. Next to it is the pernicious habit of intermingling State and national politics with municipal affairs, thus dividing the intelligent portion of the voters into two nearly equal parts and giving the balance of power to the ignorant elements. There is no city in the United States in which the intelligent and upright voters do not outnumber the others, and in which they could not by uniting secure and maintain complete control of the municipal government. Sooner or later such union will be effected, for the instinct of self-preservation, aroused finally by constantly increasing public scandals, by insufficiently punished crime, and by the accumulation of municipal indebtedness, will compel it.

Our Sins against France.

AT the breakfast given in New York by American authors, artists, and publishers to the Count de Kératry, as a representative of the sentiment of French literary and artistic societies in favor of international copyright, and at which Bishop Potter presided, Dr. Edward Eggleston, after some preliminary remarks, spoke as follows, referring to the address of the Count:

"A more admirable and dignified presentment of the right of the author to the product of his own labor is hardly to be imagined. A nation engaged in wholesale highway robbery was never before rebuked for its sins with so much politeness. The address of our guest was couched in terms so courteous as almost to reconcile one to the fate of being an American; for an American may well blush to confess his nationality when he considers that ours is the only nation of the civilized world that permits the foreign man of letters to be plundered with the sanction of its laws.

"We are here presented with a novel phase of the copyright question. We have been so intent heretofore on the evils of our copyright legislation with reference to English literature that it is with a shock of surprise that we hear ourselves charged with robbing our ancient ally, France. The Count de Kératry has reminded us of the fact that the French language resounded on the battlefields of our Revolution. But our debt to France goes back of that. The very seeds of our democratic institutions were sown by French thinkers in the eighteenth century. If our first great group of statesmen had not been readers of French literature our institutions would not have been what they are. And now comes French literature to remind us that we have repaid all our obligations by a legalized pillage of French authors. The French nation, to whom we owe so much,—the nation which in civilization, refinement, and artistic power leads the world,—reproaches us for our long-continued injustice. We have praised France without stint. But I am reminded of a scene in a comedy of Racine. It is more than thirty years since I read it, but if I misquote it, I shall hope that you, gentlemen, do not remember your Racine any better than I do. In this comedy there is a little lad employed to carry the document-bag of a great advocate. As he enters the courtroom at the heels of the lawyer, he laments the fact that his wages are not paid. 'Nevertheless,' he reflects, 'I have the honor of carrying papers for a famous advocate.' But he quickly adds, 'Mais, l'honneur sans argent, c'est une bagatelle.' I ought to translate that, not for the benefit of the Americans present, who all know French, doubtless, but I fear that some natives of France who are here may not understand French as spoken in America. I will render it not into English, but into American. For I fancy that what France says to us to-day is what the lawyer's errand-boy says in 'Les Plaideurs,' which, in modern American, is about as follows: 'A little less taffy and a little more honest pay, if you please!'"

Beneath the pleasantry of the speaker in these words there resounds a profound sense of national shame and degradation in the wretched state of the copyright laws which has permitted the appropriation, without compensation, of the results of the labors of foreign men of letters. And though Dr. Eggleston proceeded to show why we had lagged behind other nations, and to break the force of our national reproach, as far as possible, the United States stands to-day the last of all civilized nations to refuse justice to brain-workers.

It is all very well for American authors to spend their days in trying to remove this reproach. But it is really the affair of the whole people. Every man and woman interested in literature to any degree ought to write a letter to his or her congressman, beg-

ging him to exert himself to correct this great wrong by the passage of a law in keeping with the intelligence and honesty of our people. For Americans, as a mass, are not in love with dishonesty, and are not insensible to national dishonor. We protest against the leaving of this whole movement to the people interested in book-making. Every American shares in this disgrace, and we are glad that the movement for its abolition has come more and more to be a movement of the intelligent people of the whole country.

University Extension.

"A REPUBLIC has no need of *savants*," said the French terrorist Fouquier-Tinville; and agreeably to this theory the revolutionary government abolished the Sorbonne, and degraded the Collège de France into a mere high school—and a poor high school at that. Much as this declaration has been decried, it was dictated by a sound instinct. The ancient universities were hostile to the spirit of democracy. In Germany, as in England and France, the predilection for feudal institutions and the half-sentimental bias in favor of the mediæval spirit of caste have always found their ablest spokesmen at the universities. The great institutions of learning, glorying in their scholarly seclusion, have been wont to gather up their garments carefully, for fear of being contaminated by contact with the unlearned herd—the *ignobile vulgus*.

No one who is familiar with the history of such institutions as Oxford and Cambridge will deny that this has until recently been the dominant spirit. But the leaven of democracy, which is causing a mighty ferment in all strata of English society, has now actually reached these venerable seats of learning. About five years ago a movement was started, known by the name of University Extension, the object of which was to extend the usefulness of the universities—to utilize for the benefit of the people at large the vast intellectual capital which was then lying idle. The fellowships at Oxford and Cambridge, or at least the great majority of them, had until then been virtual sinecures. The fellows drew a certain sum of money annually, with the understanding that they were to devote themselves to scholarly pursuits and keep the lamp of learning brightly burning. But most of them rendered no actual service in return for their stipends. When the idea had once found lodgment that it was a desirable thing to "make learning common"—to arouse the interest of the public at large in the work of the faculties—the great body of fellows was at once found to be available for this mission of the democratization of the higher knowledge. The governing bodies of the various colleges put themselves in communication with committees of responsible citizens in the different cities who were willing to guarantee the expenses of the lecturer and a modest compensation for his labors. A representative of the college, usually a fellow of distinguished ability, was then sent to Birmingham, Manchester, Leeds, or Liverpool, or wherever his services were demanded; and in almost every instance the interest aroused and the financial success of the lectures exceeded the expectations of the committee. University Extension is now fairly well established in England, and the results of the work so far are conceded to have been beneficial.

This ought not to surprise any one. In the first

place it is a wholesome thing for a young scholar—who is prone to ossify in his learning, and to lose touch with humanity and all practical concerns—to come in contact with people whose sphere of thought and action is widely different from his own; and to be compelled to put himself *en rapport* with them and communicate with them, not in the learned jargon of the specialist, but in common human language, intelligible to all. Secondly, whatever may be said to the contrary, a smattering of knowledge (to adopt an odious phrase) is not such a bad thing after all. To the vast majority of the human race, to whom the mere rudiments of knowledge are accessible, it is not a question between superficiality and thoroughness, but between superficial learning or no learning at all. In spite of all that has been said and written against the popularization of science, science is still being popularized; and it would be a hazardous thing to dispute the great benefits which have resulted from this admirable tendency. The improved sanitation of our cities, the more intelligent regard for health in diet and clothing, the increased comfort, and the diminished waste of human life and energy, are largely due to this general diffusion of scientific knowledge.

An intellectual interest of any kind dignifies life—makes it better worth living. And to the vast multitude, scattered in hamlets and crowded in city tenements, absorbed in soul-crippling drudgery, the mere lifting out of the ordinary rut of toil for bread is a wholesome and beneficial experience. The extraordinary success of the Chautauqua movement in this country amply demonstrates this. Those of us who have had exceptional advantages of education are apt to underestimate the intelligence of those whose circum-

stances in early life have debarred them from the blessings which we have enjoyed. A summer's experience at Chautauqua would be apt to convince any skeptic on this point that average Americans—the great American people—are possessed of an intellectual alertness which enables them to profit by any kind of vital and intelligible discourse. They have little patience with learned conceit and assumption; but they have an admirable appreciation of manly worth coupled with sound scholarly acquirements.

It was a natural thing that the University Extension idea should strike root and find enthusiastic advocates at Chautauqua; and, as a matter of fact, the movement took definite shape there last summer, and is making rapid headway. But previous to this a number of gentlemen, mostly teachers in the public schools of New York, Brooklyn, and the cities of New Jersey, had undertaken a similar movement in this State, and have now begun active operations. Prominent professors and tutors of Columbia and other colleges have been invited to deliver lectures on literary and scientific subjects, and their experience so far has been most gratifying. The attendance is large and increasing, and a most intelligent interest is manifested by their audiences. The credit for what has so far been accomplished in New York and vicinity is largely due to Mr. Seth Stewart, the energetic secretary of the University and School Extension, and the prime mover in the enterprise. At a recent dinner, attended by two hundred and fifty gentlemen vitally interested in this work, speeches were made by President Eliot of Harvard and President Seth Low of Columbia, expressing their approval of the idea of University Extension and promising their valuable coöperation.

OPEN LETTERS.

Henrik Ibsen.

THE Norwegian dramatist's fame has, at last, reached England and crossed the Atlantic. A society has even been formed in London for the purpose of furthering the study of his works and their representation upon the stage. "A Doll's House," apart from its merits as a play, has produced a profound impression, and occasioned spirited polemics between the admirers of the author and his detractors, in the press. Mr. William Archer on one side and Mr. Andrew Lang on the other have sustained the solo parts, and more or less the discordant choruses have amplified their theme and given a multitudinous resonance to their voices. It is not necessary to take sides in that controversy. Liking or disliking Ibsen is largely a matter of temperament. The optimist, who takes life as he finds it and satisfies himself with the reflection that everything has been wisely ordained, will have no patience with the corrosive criticism to which Ibsen subjects the fundamental institutions of civilized society. A certain philosophic discontent is a prerequisite for understanding him. He persists in seeing problems of universal application where most of us see only annoyances, or, perhaps, misfortunes affecting our indi-

vidual lot. To judge him as a mere playwright is absurd. Though by no means contemptible as to technique, each of his plays—with the exception of the early historical ones—is a dramatized piece of philosophy. Each preaches more or less incisively a moral lesson, lays bare a social canker, diagnoses a social disease. But what distinguishes Ibsen above all others who have hitherto dealt in this species of morbid anatomy is the fine surgical precision with which he handles the scalpel and the cool audacity with which he cuts.

It is not the obvious vices he attacks; it is the hidden subtle defects. As Dr. Brandes has said in his masterly essay, "It became a passion with him to tap with his finger whatever looked like genuine metal, and to detect with a kind of painful satisfaction the ring of hollowness which grated on his ear and at the same time confirmed his expectation." He admits nothing to be sound until he has tested it, and so keen and searching is his test that no hidden flaw escapes his scrutiny. It is as often in the virtues of society, its vaunted perfections, as in its foibles that he finds the evidences of its unsoundness. Society enters at his door as a man, imagining himself in vigorous health, enters the office of the physician who is to examine him for life insurance. But it comes out crestfallen,

with tottering step. An unsuspected disease is lurking in its vitals. Something is wrong with the heart, or the brain, or the circulation of the blood.

Naturally, the man who has the penetration to make and the courage to trumpet abroad these unpleasant discoveries can never be popular. Though he is widely read both in Germany and in Norway, Sweden, and Denmark, and his plays are frequently produced, it has always been a limited minority of the public to whom he has appealed. But this minority makes reputations; and its influence is all out of proportion to its numbers. And Ibsen cherishes so profound a distrust of the popular verdict, whether it be in art, literature, or politics, that I verily believe he would begin to doubt the soundness of his own convictions, provided they received anything like a popular indorsement. In his opinion, the many are sure to be wrong; and a democracy, governed by the many, is therefore, in the present state of humanity, the absurdest form of government conceivable. The foolish are in every community in an overwhelming majority; the wise, the truly cultivated and intellectual, capable of exact thought, are a vanishing minority. Democracy means, therefore, the government of the wise by the foolish.

In his very first play, "*Catiline*," written before he was twenty-two years old, this view of life is fully matured. *Catiline's* plot against Rome is the corrupt individual's legitimate vengeance upon the society responsible for its corruption. *Catiline's* greatness is his curse. He cannot stoop, as Cicero does, to flatter the multitudes whom he despises, and by utilizing their folly rise upon their shoulders to civic eminence. He is compelled by his noble scorn of political trickery and petty arts to fling down his gauntlet to Rome; to wage war single handed against the world-empire. That Rome in the end proved too strong, in Ibsen's opinion detracts nothing from the sublimity of the challenge.

The same sympathy with extreme types, who loom in dusky grandeur above the heads of the throng, is manifest in the four historical dramas, "*The Wassail at Solhaug*," "*Mistress Inger of Oestraat*," "*The Warriors of Helgoland*," and "*The Pretenders*," which for fineness and force of characterization and dramatic intensity and power are unsurpassed in Scandinavian literature. In 1862, Ibsen, without entirely abandoning the field of historical drama, made his first essay as a satirist of contemporaneous manners. "*The Comedy of Love*" ridicules the tuning down of the poetry of love into the prose of an engagement. The man of high beliefs, capable of heroism, is, by regard for his *fiancée* and family relations, transformed into a timid Philistine. Society holds it to be legitimate for a married or an engaged man to be unfaithful to the ideals of his youth, to apologize for that which was noblest and best in him as youthful folly. Nay, it nurses the lurking cowardice in his nature and praises his surrender to Mammon as practical, and justified by family considerations. Ibsen is brimming over with scorn for this kind of marriage, which means a pusillanimous compromise with a sordid reality, the harnessing of the winged Pegasus to the plow of necessity (where he soon degenerates into a sorry family nag); the sobering of the high dithyrambics of untrammelled youth, by conjugal affection, into the spiritless jog-trot of matrimony.

Ibsen's next work, "*Brand*," a dramatic poem, deals

with a kindred theme, though one of much larger dimension. It is the most original work which ever has been produced in the Scandinavian countries, and the most profoundly philosophical. Brand is a clergyman who is resolved to live in absolute conformity with Christ's command, without compromises or concessions. He interprets, literally, the injunction "thou shalt," and the prohibition "thou shalt not." The ideal demand is the absolute demand, which admits of no adaptation to circumstance, no bargaining or half-way fulfilments or splitting of the difference. "If any man come to me," says Christ, "and hate not his father, and mother, and wife, and children, and brethren, and sisters, yea, and his own life also, he cannot be my disciple." Brand, in his effort to embody in his every action this heroic gospel, wrecks his own life and that of every one who is dear to him. When the physician declares that his only child must die unless he moves away from the fierce, sunless mountain region in which he is pastor, he refuses, though it wrings his heart, and lets the child die. Heartrending in its tragic force is the scene where he compels Agnes, his wife, to give the dead boy's clothes—which she worships with a bereaved mother's idolatry—to a wandering gipsy woman; as also the scene where he closes the shutters on Christmas Eve, and forbids her to stare out into the graveyard and shudder at the thought of her child lying under the snow. This kind of Christianity in a society built upon half-way measures and compromises leads necessarily to destruction.

Merely as the expression of a vigorous soul who fashions his God in his own heroic image, and scorns all weak popularizing of the sublime, this is full of interest. Christianity has, in his opinion, been vulgarized by its adaptation to average, commonplace men, and its demand of absolute purity, uprightness, and saintliness has been compromised at thirty or fifty per cent., according to the ability of imperfect human nature. The idea pervades all his writings that civilization has dwarfed the human race. Paganism, with its enormous social inequalities, and the untrammelled liberty granted to him who was strong enough to conquer it, created heroes and pygmies, while Christianity in its practical effects has raised the small at the expense of the great, or reduced the great for the benefit of the small. There are few now who will sympathize with this complaint, and even in Norway Ibsen's is a solitary voice crying in the wilderness. In English literature Thomas Carlyle represented a kindred tendency and intoned a similar lament. But he was far less consistent than Ibsen, and with all his scorn of the Philistine was less audacious in his arraignment of the paltriness and pusillanimity of the modern democratic state.

Of Ibsen's later works, which are all in dramatic form, I will now refer only to the most conspicuous. In "*Peer Gynt*" he lashes the boastful Norwegian patriotism, which finds consolation in a heroic past for the impotence of the present. *Peer Gynt*, who is intended as the type of the race,—if the expression be permissible,—"lies himself great." His grand intentions reconcile him to his paltry performance. He lives a heroic dream-life, and deludes himself with visions of glory which are far removed from the realm of fact. His mendacity acts as a safety valve for his pent-up spirit. The unheroic present affords him no field of action for the greatness that is in him, and his restless

energy finds a refuge in a realm of fancy, where he performs all the fabulous deeds for which reality denies him the opportunity. He is psychologically comprehensible even when he cuts the sorriest figure; for it is a fact, and by no means an uncommon one, that the paltriest lives may be irradiated with the fantastic light of wonderland, without being at all, as far as the world is concerned, redeemed from their paltriness.

It is not a grateful task to tell people unpleasant truths, and Ibsen had to pay the penalty of his sincerity. Though it is an exaggeration to say that he was forced to leave his country, it is true that he lives in voluntary exile. He is of a solitary nature, reserved, almost shy, though not from lack of self-confidence. He always reminds me of a great solitary creature of prey, prowling, with a suspicious feline watchfulness, upon the outskirts of society. Having selected and silently spotted his prey, he makes his spring, pouncing now upon this foible, or vice, or imagined virtue, now upon that. First it was love he assailed, striking a set of pitiless claws into its delicate body; then it was patriotism, matrimony, hypocrisy, etc. In "The Pillars of Society" the theme is the inner rottenness which an outward respectability may cover. Every one bows to the standard of virtue which society has set up for its own protection and imposes upon its members. When a character in which the barbaric strain of passion is too strong for control breaks through its barriers, it has to do so secretly and still continue to pay homage to virtue and wear its mask. If we are to believe Ibsen, this imposition of the virtuous mask is an odious tyranny which entails a worse degradation than an open avowal of vice. Society needs an airing out now and then, a grand *exposé* of its hidden crimes and wrongs, as a preliminary to a healthier condition.

"A Doll's House"—or literally "A Doll-Hoime"—deals with matrimony; but it may as well be admitted that, as a social satire, it has less application on this side of the ocean than in Europe. Wives are not here, as a rule, the playthings of their husbands. Nor are they usually lacking in individuality. Girls are, to be sure, brought up with far less reference to their individual character and proclivities than are boys; and as long as the chief object of the great majority is to become wives and mothers, they have to be trained with a view, not primarily to their own development, but to make them pleasing to men. As long as this is the case, the situation in "A Doll's House" may well find its counterpart anywhere. *Nora* has been petted and spoiled, first by her father, and then by her husband, and no one has taken pains to make her acquainted with the machinery of the society in which she lives. She has been shielded from contact with the rough realities of life. She has so little idea of business relations and the ethics which govern them, that she forges her father's name for the purpose of saving her husband's life, and has not the remotest idea of the enormity of the act she has committed. She cannot comprehend it; her feelings tell her that she has acted from the noblest motives, and she declares that the laws are unjust if they forbid a wife to save her husband's life.

This reasoning is essentially womanly, and is not confined to one side of the Atlantic. Her glib mendacity, too, which is almost purposeless, is not a sign of depravity, but of lack of development. It is the mendacity of a child. It is a kind of mendacity which is

far more common among women than among men; because, though women are not ignorant of the wrong of lying, they are not, from their very nature and education, so strongly convinced of the binding character of social ethics, when they conflict with individual feeling. When *Nora* expects "the wondrous thing" to happen, namely, that *Helmer* shall shield her by declaring himself guilty of the forgery, she has really no conception of what such a sacrifice would involve. She only sees what effect it would have upon her; how it would forever unite her to her husband with a deep and abiding love. But she reasons again like a child, even when she finds her real self, and is resolved to go forth alone, abandoning her children, and not return to them until she has developed, by the experience of the world, into a definite and individual being. A marriage cannot exist except between two human beings, two coordinate persons, each contributing a definite character and developed personality to the union. But *Nora* is little more than a personification of her sex, and she feels how much more she might have been if opportunities for development had been afforded her. Her dormant human soul awakes and demands its rights. It will no longer consent to effacement. She declares that her first duties are not to husband and child, but to herself. And this declaration is profoundly characteristic of Ibsen. He utterly repudiates social obligations if they involve detriment to the individual character. He would, no doubt, agree with Herbert Spencer, who states in substance that the most perfect marriage is that which provides the highest development for the offspring compatible with the individual well-being and development of the parents.

It is contrary to the tendency of modern thought to emphasize individual rights *versus* social obligation. But Ibsen represents wholly this contrary tendency. Others have pointed out our gain by the social compact, he never loses an opportunity to emphasize the loss; and he says, in "An Enemy of the People," "The strongest man is he who stands alone."

Hjalmar Hjorth Boyesen.

Bloodhounds and Slaves.

AN interesting article on the English bloodhound, by Mr. Edwin Brough, in the June, 1889, number of THE CENTURY MAGAZINE, reminded me of the long-standing slander that the Southern master formerly used the bloodhound to run down his runaway slaves. Mr. Brough says that the English bloodhound "is quite different . . . from the Cuban bloodhound of slave-hunting notoriety." We look at the article "Bloodhound," in "Chambers's Encyclopædia" (J. B. Lippincott & Co., editions of 1884 and 1887). I find the following statements: "The Cuban bloodhound, which is much employed in the pursuit of felons and fugitive slaves in Cuba, differs considerably from the true bloodhound of Britain and continent of Europe, being more fierce and having more resemblance to the bull-dog. . . . It is this kind of bloodhound which was formerly employed in the United States for the recapture of fugitive slaves." It is not surprising that Englishmen should believe all this, as it is what we told them of ourselves. Laying aside the brutality, one would hardly think that an ordinarily sensible man would

purposely select so ferocious a brute as the Cuban bloodhound is reputed to be to tear to pieces or maim a valuable chattel worth \$1000 or \$1200, especially as this animal, "resembling the bull-dog," is very deficient in nose. This simple statement ought to show the absurdity of the slander. As to this Cuban bloodhound—so terrible to the morbid imagination—and its use in the Southern States, I have lived for many years in Virginia, Georgia, and Alabama, and I can count on the fingers of one hand every one I ever saw. They were said to be fierce, and were used as guard dogs when used at all.

The dog used in the Southern States for tracking criminals and fugitives was the ordinary little foxhound of the country, familiar to everybody. His nose is all but infallible, but he is very timid about attacking man. Consequently, while it was next to impossible to escape him, the master of the colored fugitive knew that his property was in no sort of danger.

To illustrate this: when I was a boy living in Georgia I was fond of talking with an intelligent colored man who belonged to a neighbor. On one occasion he "took to the woods." Trained foxhounds were put on his trail with the usual result. I asked him after he was brought home if he had not been frightened when the dogs came up with him. He laughed at the question and said: "I knew when they found me there was no use running, as they would follow; but they won't trouble anybody. I just took up a little stick, and they stood off twenty or thirty yards barking." The first time I ever knew of dogs being used to track any one illustrates their disregard for color or condition. A wealthy and respected man who lived near a Southern city took a fancy to increase his wealth by setting fire to his barn, which was insured. About daybreak the hounds were produced to find the criminal. To the surprise of everybody, the trail was carried to his front door by the dogs. No one prosecuted him for burning his own barn, but the canine evidence destroyed his standing in the community and prevented his getting the coveted security.

I suppose it will hardly be believed, but, as a fact, dogs were rarely used in the South for tracking human beings. I never knew of a case where they were used in Virginia, and I lived several years in the black belt of that State. I saw but one pack in Georgia, where I lived many years, and I never heard of a pack in Alabama, where I spent a good deal of my youth in a planting community where the colored people predominated largely in numbers.

William N. Nelson.

The Evolution of the Educator.

A LETTER lately printed in *THE CENTURY* reveals a grievance that is truly refreshing. The best teachers, it seems, are taken out of the school-rooms and put into offices, there to be "educators," but no longer teachers.

You may be sure that those teachers, thus placed, perforce, in office, do not stay there long at a time; they get, by an irresistible attraction, back into the school-rooms, and they scatter through a hundred schools the bright ideas and the cheerful magnetism that made their own work so successful. Of course there must be leaders in any well-conducted business; no one could desire that the great educational army

of this country should degenerate into a mere headless mob. Now, in most places it is considered wise to pick out those who show the greatest ability in a given work and place them at the head of that work; the best spinner in a room is placed in charge of all the others, and he spins no more; the best player in the band becomes the leader, and plays but little thereafter; the best lawyers are chosen judges—it is hoped. In all these cases it is believed that the work as a whole distinctly gains by taking out the very best worker and placing him in authority over the rest, his brethren. Why does not the same rule hold good in teaching?

And finally, look, for instance, at the city of Boston: there are nearly fifteen hundred teachers, and there are six supervisors; the number of officers seems hardly to indicate a complete rendering of the "army idea." The supervisors hold office until they die, being likewise mightily encouraged unto long life; and it can hardly occur oftener than once in half a dozen years that the school committee can choose a successful teacher from the school-room to make into that suspicious creature, an "educator." Are the ranks in immediate danger of being depleted?

HINGHAM, MASS.

L. P. Nash.

The Pardoning Power.

THE Cronin verdict in Chicago will be of great value to the world if it shall awaken the consciousness of the people to the evils resulting from vesting the power of pardon in the executive.

While life imprisonment in theory is more to be dreaded than capital punishment, it is in reality less dreaded, for the simple reason that a prisoner under life sentence always hopes for pardon, and the history of the use, or abuse, of the pardoning power in this country justifies the hope.

Why not abolish the pardoning power? Experience has shown that certainty of punishment, even if the punishment be moderate, is a greater check upon crime than the mere possibility of the severest punishment. Criminals are notorious gamblers in risks.

If we violate the laws of nature there is no escape; the very day we eat the forbidden fruit, we shall surely die.

What more effectual deterrent from crime can we present to weak or wicked humanity than a knowledge of the fact that no guilty man once convicted of a violation of the law can escape the full penalty for his crime? Let us have a court of revision to whom applicants for release on the ground of wrongful conviction may come. And if a convicted man shall be able to produce new evidence tending to show that he was wrongfully convicted, let this court give a rehearing of the cause, and if his innocence be established let the court vindicate, not pardon, him.

The innocent man wrongfully convicted wants justice, not mercy or pardon. Why compel him longer to be classed with those who have escaped the punishment of their crimes through political or social influence?

MOLINE, ILL.

Eugene Lewis.

SURGEON C. S. TAFT and Alex. Williamson (tutor at the White House) write to say that their names were omitted from the list, in the January *CENTURY*, of persons present at the deathbed of President Lincoln.

MEMORANDUM ON THE CIVIL WAR.

The Builders of the First Monitor.

THE story of the creation of the first *Monitor* has not as yet been fully told. The papers on the subject in *THE CENTURY* and in "Battles and Leaders of the Civil War," filled as they are with facts of interest and importance, are marked by a serious omission of other facts essential to a just award of credit among the builders of the *Monitor*.

Colonel Church, in his paper on John Ericsson, in this magazine for April, 1879, mentions the fact that "there were associated with him [Captain Ericsson] three men of practical experience, great energy, and wealth." Colonel Church names but one of the three, Mr. C. S. Bushnell, though the other two had much the larger share of the practical experience and wealth, and constituted in fact the financial backbone of the enterprise.

Mr. Bushnell, in his letter printed in "Battles and Leaders" (Vol. I., p. 748), names his "two wise and able associates," but omits to mention the facts that his mission at Washington in behalf of Ericsson's battery had failed, and that only after these associates of his brought their experience, energy, and wealth to its aid did that invention stand any chance for adoption by the Government.

Captain Ericsson, in his paper on "The Building of the *Monitor*," discloses his theory that it was his personal argument and explanations before the Naval Board that secured the assent of the Board to a trial of his battery. But it is a demonstrable fact that the assent of the Board had been gained, and a memorandum or preliminary contract for the construction of a floating battery on his plan had been secured by his associates, before Captain Ericsson appeared on the scene at Washington, and before his two leading associates in the construction of the *Monitor* had ever met him.

The salient facts of this transaction, set in the proper order of time, are as follows: Roused by the national emergency, Ericsson had devised his impregnable "cheese-box on a raft." But he was crippled as to means, and out of favor with the Navy Department, and he had felt so outraged by the refusal of the department to pay him for his services in the construction of the United States frigate *Princeton*, that he would not approach the department, nor so much as visit Washington. So his design for a floating battery lay unknown in his office till his friend C. S. Bushnell saw it, approved it, and took it to Washington. Mr. Bushnell secured the attention of Secretary Welles, with whom he was on terms of personal acquaintance, but found a tremendous obstacle in the Naval Board, charged by Congress with the decision of all matters relating to ironclads.

Days lengthened into weeks while Bushnell labored ineffectually to remove the prejudices and obtain the approval of the Board, till he at last desisted under the distinct notice from one of the Board that it was per-

fectly useless for him to haunt the department further on any such errand. His own efforts having proved thus unavailing, Bushnell applied to John F. Winslow of the Albany Iron Works of Troy, N. Y., who, with John A. Griswold of the Rensselaer Iron Works of the same city, was in Washington on business connected with the iron plating of the United States ship-of-war *Galena*. Mr. Winslow was struck by the ingenuity and merits of Ericsson's design. He took it to Mr. Griswold and secured his coöperation in an effort to have it adopted by the Government.

These new factors simplified the problem. Winslow and Griswold were leading ironmasters. They had capital, of which Ericsson had none and Bushnell little. They had political as well as personal standing and influence. Backed by such men, the project took on the character of a responsible undertaking, and men who had hitherto turned a deaf ear began to listen.

For obvious reasons, Winslow and Griswold decided to take the scheme past the Naval Board, directly to the head of the nation. Bearing a letter of introduction from their friend Secretary Seward, they secured an interview with President Lincoln, laid the drawings before him, and explained the strong points of the plan. When they ceased speaking Mr. Lincoln asked, "Why do you not take this to the Board which has charge of these matters?"

"Because it has been there to no purpose," was the reply. "Nevertheless, we believe it solves a problem of vast importance to the national cause; and not as ship-builders, for we are not such, but as loyal citizens, we appeal to you to give it a trial."

Impressed by the earnestness of the men, Mr. Lincoln meditated, and then said: "Well, gentlemen, I don't know much about ships, though I once contrived a canal-boat, the model of which is over there in the Patent Office, the merit of which was that it could run where there was no water. But this plan of Ericsson's seems to me to have something in it. Meet me to-morrow morning at Commodore Smith's office in the Navy Department."

That meeting at the Navy Department has been heretofore described. Commodores Smith, Paulding, and Davis, of the Naval Board, Captain Fox, and other officers of the navy were present. Mr. Winslow was the spokesman, and laying out the drawings, he explained the plan of the battery, and urged its adoption with powerful earnestness. The meeting ended with Mr. Lincoln's blunt expression of opinion that there was "something in the thing," emphasized by his quaint remark about the girl's stocking, which has become historical.

Mr. Lincoln's obvious approval had its effect, and next morning Commodore Smith expressed to Mr. Winslow a willingness to authorize him and his associates to construct a floating battery on Ericsson's plan, provided they would assume all the risks of the experiment.

This condition, which the Board possibly supposed would end the whole matter, was accepted, and a memorandum covering the main points of the proposed contract was drawn up and agreed upon. The Naval Board having some doubts, however, in regard to the sufficiency of the strange craft as a sea-going vessel, Captain Ericsson was next called to Washington. He found no difficulty in demonstrating the stability of the proposed vessel, and the contract was perfected without delay.

The contractors of the first part were four in number, named in the instrument in the following order: John Ericsson, John F. Winslow, John A. Griswold, and C. S. Bushnell. In addition to other rigid conditions, the contract contained a provision that in case the said vessel should fail in performance of speed for sea service, or in the successful working of the turret and guns, with safety to the men in the turret, or in her buoyancy to float and carry her battery, the party of the first part should refund to the United States the amount of money advanced to them on said vessel, within thirty days after such failure should have been declared by the party of the second part, and that the vessel should be held by the United States as collateral security until the money so advanced should be refunded.

Only men of strong patriotism and strong faith would have assumed obligations involving so large an outlay, to be expended upon a novel device distrusted by experienced naval officers, and upon terms which threw upon them all the risks, even though failure might be due to insufficient skill on the part of a commander and crew in the selection of whom they had no voice.

Mr. Bushnell says that this condition was never an embarrassment to Captain Ericsson and himself. If so, may it not have been because their pecuniary risk was so much less than that of their associates? If the *Monitor* had failed in performance, Winslow and Griswold would have lost three-fourths of all the money expended in her construction, Bushnell, or his financial backer, would have lost one-fourth, and Captain Ericsson would have lost his time and labor. But Colonel Church intimates, in a way which amounts to a statement of a fact, that after his experience with the *Princeton*, Captain Ericsson would not have accepted this condition had he known it in advance. However this may be, Winslow and Griswold accepted this hard condition and signed the contract before it was taken to Captain Ericsson for his signature.

My space in these pages does not permit me to cite documents; but I have made no statement above that cannot be sustained by documentary proof or by the evidence of an unimpeachable living witness in the person of John F. Winslow. I submit that these facts show that two names which have had but the barest mention in THE CENTURY articles on the *Monitor* should be brought to the front. For the men who bear them were

both at the front and the back of the enterprise. They took the lead when others had failed. They secured President Lincoln's approval. They argued the question before the Naval Board. They brought to the project the personal and financial responsibility indispensable to its acceptance by the Navy Department. They advanced all the money expended on the *Monitor* up to a comparatively late stage in her construction, and they furnished large quantities of iron and materials. Without their resources the contract could not have been executed by their associates. They made no money and cared to make none on the first *Monitor*; but without their capital the first *Monitor* probably never would have been built; and without their earnest and powerful efforts in forwarding the work of construction the *Monitor* certainly would not have been ready in time to meet the emergency in Hampton Roads, and thus save the credit of the United States as a naval power, prevent the dissolution of the blockade, and defeat the recognition of the Confederacy by England and France. These men were John F. Winslow, still living in honored retirement in his home on the Hudson, and the late Hon. John A. Griswold of Troy.

Other names also deserve mention. That of Thomas F. Rowland of Greenpoint, L. I., who as a sub-contractor built the hull of the *Monitor*, has been printed in THE CENTURY. Other sub-contractors were the Delamater Iron Works of New York, who made the engine, machinery, and propeller, and Abbott of Baltimore, who supplied the turret plates.

One fact more. The man who is popularly credited with the invention of the revolving turret was not the original inventor of that distinguishing feature of the *Monitor*. Of this he was well aware. In Captain Ericsson's paper on "The Building of the *Monitor*" he refers to a revolving tower invented by Theodore R. Timby, describing it as a device for warfare on land. This is an insufficient description. The records of the United States Patent Office show that Timby's device was a revolving tower or turret, for use on land or water. It was protected by a caveat, issued in 1843, eleven years before Captain Ericsson submitted to Napoleon III. his plan for a floating battery with a revolving dome. A patent for it was issued to Mr. Timby in September, 1862, and Captain Ericsson and his associates in the building of the *Monitor* paid Mr. Timby, for the use of his patent, a royalty of \$5,000 on each of the monitors constructed by them subsequent to the first. Is not this circumstance of interest enough to be comprised in the history of the *Monitor* as related in this magazine? John Ericsson was a great inventor. His fame is secure. Certainly I would not lessen by a jot the credit which is his due. Let others also have the credit which is theirs.

BRIC-À-BRAC.

Dorothy.

THEY tell me 't is foolish to prate of love
 In the sweet and olden way;
 They say I should sing of loftier things,
 For Love has had his day.
 But when Dorothy comes
 I cannot choose,
 I must follow her
 Though the world I lose;
 My very soul
 Pours forth in song
 When dainty Dorothy
 Trips along.

It is all very well to say to me
 That Browning's noble strain
 Rises and swells with the tide of thought
 Or throbs with the pulse of pain;
 But if Dorothy once
 Had crossed his path,
 Her radiance such
 A witchery hath
 That across the world
 Would not seem long
 To follow Dorothy
 With his song.

Charles Henry Phelps.

When a Smokin'-car is 'Tached.

SOMETIMES when I 'm on the way
 Into town on market-day,
 'T hurts like sixty fer to see
 Folks 'at 's better dressed than me
 Scrouge up tighter when I sit
 Down beside 'em — 's if I bit.
 But my heart don't git so scratched
 When a smokin'-car is 'tached.

When a smokin'-car is 'tached
 Then 's the time yer comfort 's caught,
 When you give yer pipe a poke
 And lay back and watch the smoke
 Till it makes yer old eyes itch,
 While you 're dreamin' you was rich.
 Folks don't see yer coat is patched
 When a smokin'-car is 'tached.

When a smokin'-car is 'tached
 Then 's the time yer dreams are snatched,
 Then you 're rid of Jen's old marm,
 Then the mortgage 's off the farm,
 Then the old peach-orchard pays—
 I vum I could spend whole days
 Countin' chickens 'fore they 're hatched
 When the smokin'-car is 'tached.

S. Walter Norris.

At the Concert.

YES, I s'pose it 's real music — it 's a mighty heap o' sound,
 With the treble way up yonder an' the bass down underground,
 With the demi-semiquavers an' the tinklin' o' the keys,
 An' a fuss like wind a-roarin' through the branches o' the trees.
 An' ye say that Wagner wrote it, an' ter hear it is a boon?
 But, somehow, the feller never seems ter overtake the chune,
 Though his fingers run like lightnin' an' he twists upon his stool,
 An' ruffles up his ha'r untel he looks a orful fool:
 An' somehow I miss the feelin' that I allers uster feel,
 That was sweet untel it hurt me f'om mer head down ter mer heel,—
 That 'u'd make mer eyes git misty an' mer mouth ter twitch an' smile,—
 When I listened ter Mirandy playin' "Mary uv Argyle."

Why, ter hear Mirandy playin' was ter see the water run
 Like a streak o' shinin' silver jes a-sparklin' in the sun,
 An' up above the medder ye could hear a thousan' birds
 A-singin' jes as easy as ye hear me talk these words;
 Ye could fa'rly smell the early blooms upon the apple trees,
 An' ye owned a fine plantation an' much money as ye please.
 Lord, how ye loved yer neighbor, an' never wisht no harm
 Ter him about the lawin' 'cause his fence run on yer farm;
 An' the milk o' human kindness kep' a-flowin' far an' free,
 An' eve'ythin' about the world was like it ought ter be,
 Tell ye kinder seemed in heaven, peart an' happy, all the while
 That ye listened ter Mirandy playin' "Mary uv Argyle."

Well, I s'pose I am ole-fashioned, an' it would n' hardly do
 Fer him ter play the music that I useter cotton to.
 These town-folks would n' keer ter hear about the "hunter's horn,"
 Nor 'bout the mavis singin' out "his love-song ter the morn";
 So I 'll set an' listen quiet while the feller bangs away,
 An' I 'll 'low that his planner beats a injine any day;
 But it ain't mer style o' music — an' with all mer due respect
 Ye can say ter Mister Wagner, when ye chance ter see him nex',
 That the loudes' fuss ain't allers what is certain sho ter please,
 Nor the bes' musicianer the one that tries ter bust the keys;
 An' though I have no doubt but he 's a social sort o' man,
 I would n' walk a squar' ter hear the bes' thing f'om his han';
 But oh, if she was livin' yit, I 'd foot it forty mile
 Jes ter listen ter Mirandy playin' "Mary uv Argyle."

THE AUTOBIOGRAPHY OF JOSEPH JEFFERSON.

(Copyright, 1889, by JOSEPH JEFFERSON. All rights reserved.)

SOME REMARKS ON GUYING.

AMONG the well-remembered characters of my dramatic life was an actor named Salisbury. The only influence that he exerted upon the stage during his career was, I regret to say, anything but a good one. "Guying" was formerly a slang term, but it has of late years become a technical one for trifling with a part upon the stage. The art of guying was Mr. Salisbury's forte, and it was the only thing that he did well. Life was one huge joke to him: he treated nothing seriously. He was the delight of actors and the bane of managers. It is related of him that he once sent a telegram to Mr. Rice of the Chicago Theater applying for an engagement. The manager sent back this answer: "I would not engage you if you would come for nothing"; to which Salisbury replied: "Terms accepted. Will be with you to-morrow."

This man's memory was so wonderful that it was almost impossible to ask him a question without getting a Shakspearean quotation in reply. If he was imperfect in his part, which was generally the case with him, he would interpolate speeches from other characters, talking the most absurd nonsense, and turning a serious scene into ridicule. Sometimes the audience, detecting this impertinence, would hiss. This rebuke was the only thing that would check him, for any slight put upon himself was keenly felt; but the next night the chastisement would be forgotten, and he would repeat his indiscretion. It was said of him that he was generous to a fault; and I think he must have been, for he never paid his washerwoman. One morning the poor old laundress was dunning him for her hard earnings. He was standing at the stage door, sur-

rounded by a circle of admirers, and turning furiously upon the old woman, he paraphrased *Macbeth's* speech to the ghost of *Banquo* in the following words: "Avaunt, and quit my sight! Thy tubs are marrowless; there is no starch in my fine shirts that thou didst glare withal! Approach thou like the Russian manager, the Hyrcan critic, or the 'Old Rye whisky-us'; or, be alive again, and make it salary day. If, trembling then, I do inhibit thee, confess me but a babe of a Salisbury." The laundress fled in despair, only too glad to escape unpaid from the supposed lunatic.

Innocent mirth is most desirable, but not mirth expended at the cost of another's feelings; and Salisbury's unfortunate career, terminating as it did in sickness and poverty, is an example of a handsome man, possessed of fair ability, who, by utter disregard of loyalty to his manager and of respect for the public, gradually lost the confidence of all who knew him, and became a neglected wreck. The practice of guying is unpardonable, and the indulgence in it unworthy of an artist or a gentleman. The leisure hours passed in the dressing-room or the greenroom afford ample time for an actor's amusement without inflicting the exuberance of his personal humor upon the audience. The rehearsals and subsequent performances of a play are not his property, and he has no right to mutilate them. Managers and leading actors are altogether too lax in their rebuke of this senseless and ruinous practice. They should neither commit the outrage themselves nor permit it in others. "Where example leads the way" the multitude will follow, and no leader can rightly claim the respect of his company unless he shows it to them and the public. I have a suspicion that guying begins where ability leaves off, and that many actors exhibit this trifling to conceal their own shortcomings.

JOSEPH JEFFERSON AS "RIP VAN WINKLE."

I believe it is the ostrich that runs his head in the sand, thinking that if he does n't see his pursuer his pursuer can't see him: I wish, for the sake of simile, that it were the goose. Actors are often under the erroneous impression that their auditors do not observe these little bits of trifling. They not only observe them, but they resent them in a quiet and dangerous way—they do not come again. Having paid their money, and perhaps foregone the pleasure they could have enjoyed somewhere else, it suddenly comes upon them that they have been taken in, and are sitting in front of the theater only to witness the enjoyment of the actors, who are reveling in some private joke and refuse to let them into the secret; and as they walk home, pondering on their experience, they determine within themselves never to risk a repetition of the occurrence.

An actor, perhaps a good one, too, comes gaily on the stage. The audience like him and give him a hearty welcome; an evening's enjoyment has been promised, and they are in high expectation of the compact being fulfilled. Ah! who are those young fellows in the private box? Quite a jolly party, I declare. They know the comedian, too; see, he recognizes them. Now the comedian—just for fun, you know; he does n't mean any harm by it—introduces some joke: foreign to the play, to be sure; but then the private box recognize it at once as some allusion to their last merry-making. How they do enjoy it! Now a friendly wink, they laugh again; it's delightful. But how about the audience all this time? What are they doing while all this sport is going on? I will tell you. They are not hissing, to be sure,—well-bred American audiences

seldom forget themselves so far, for they feel this breach of decorum would interfere with the enjoyment of others,—but they are determining within their minds that they are insulted, and that they will never come again to see that actor. He has taken a liberty with them that they will neither forget nor forgive.

I will not say that in my youth I never indulged in what I am now condemning. I did so, but I never obtained the position I coveted until I abandoned the pernicious habit. There is no other profession in which honest

and serious attention to the matter in hand is so promptly rewarded as ours.

Suppose, for an example of the harm that might be done, we take a case like this: An actor has worked for weeks patiently to study or perhaps create a character, and his success in it may prove the turning-point of his life. He is poor, and has a large family to support. If he but hit the part, his fortune is made, and he will not only serve the manager, the author, and the public, but be enabled to provide comforts for his home and an education for his children. Now, with all this at stake, some

wanton actor deliberately "guys" his part and overturns the patient care of his comrade, undermining the foundation and causing the whole structure to fall to the ground. See what a wreck we have here! Think of a poor artist before a picture upon which he has spent days of toil and nights of thought. It is just ready for the Academy, and now some comrade steals up behind the easel and pours a pot of paint over the canvas, ruining the work. What shall be said of him? And yet he may have done no more harm than the actor who has ruined the bright prospects of his brother actor.

I do not say that guying is always the result of cruel mischief. A man may be really good-hearted and yet do all this damage; but whether it be from design or thoughtlessness, the result is the same, and the habit should be frowned down and checked by every honest actor. In making these assertions I do not put them forth as an argument. This subject does not admit of argument, for nothing can be said in defense. There is no other side to the question. But the actor who guys is as much to be pitied as condemned, for the crime carries the punishment along with it.

THE COMEDIAN'S DISADVANTAGE.

THE repertory that naturally falls to a tragic actor gives him an immeasurable advantage over a comedian. Nearly all of the tragedies or serious plays, both of ancient and modern structure, have for their heroes one conspicuous and central figure, who is in a marked degree superior to the surrounding characters that support him, whereas the comedies, with but few exceptions, have been constructed with the view of displaying a group of actors.

If the starring system, as it is called, be an evil, then Shakspeare is undoubtedly responsible for its existence, as his tragedies almost without exception contain one great character on whom the interest of the play turns, and upon whom the attention of the audience is centered. When he introduces two figures for this purpose, as shown in the attitudes of *Othello* and *Iago*, and *Macbeth* and *Lady Macbeth*, they are so closely knit together that the double light shines only with a single ray. In the play of "Romeo and Juliet" it is supposed that *Mercutio* was killed early in the drama lest his brilliancy should dim the luster of the lovers. There are undoubtedly other splendid characters in the tragedies of Shakspeare, but when brought in contrast with the magnitude of his heroes they are comparatively subordinate. In his comedies the characters are formed in groups, and are generally so arranged that

they may be in some measure of equal value. *Falstaff* would seem to be an exception, yet even here the historical drama of "Henry IV.," in which the fat knight figures so conspicuously, is a play, not a comedy. Under these conditions the comedians of the olden time, though great favorites with the public, and in many instances superb actors, as individual attractions never drew large audiences. Possibly Sam Foote, who acted during Garrick's time, and later the elder Mathews, were notable exceptions; but even these actors, the legitimate comedians, were forced to abandon the old comedies and arrange special entertainments of their own in which they gave imitations of popular and easily recognized public characters.

THE FIRST SUCCESSFUL STAR COMEDIAN.

THE first to command universal attention as a single magnet was Tyrone Power. Possibly he was no greater than the comedians that preceded him, but Irish comedy up to the time of his advent had been confined to characters that were less important. Fortunately for Power, a number of rollicking and effective plays were written for him, through which his own unique character shone with special brilliancy. Besides this, he was not a mushroom. His professional growth had been gradual and healthy. As the leading juvenile actor and light comedian of the Theater Royal, Dublin, he had been for four years the prime favorite of the city, and afterwards, as a leader in legitimate plays at the Haymarket Theater, in London, he held a no less important position. This career was a firm foundation upon which to build his lighter, but to the public more valued, work; so that his long theatrical experience, added to his new and effective repertory, ranked him as the greatest and most successful Irish comedian of his time. I am not aware what effect Power's success as a star had upon the English stage,—it is more conservative than our own,—but his achievements here stirred up a new ambition among the comedians of America, and with national energy they immediately set to work developing their especial gifts; and these in many instances qualified them for becoming distinct features. Casting aside the old comedies, they came forward with novel and effective, if not legitimate, plays. Dramatic portraits of Dutchmen, Yankees, Frenchmen, together with the Western and local characters of our own country, were speedily and vigorously exhibited, many of them commanding immediate attention. Among the most successful comedians may be mentioned Hackett, Hill, Marble, Burke, Chanfrau, Williams, and, later on,

HARRY A. PERRY. (SEE PAGE 811.) (FROM A PRINT IN THE COLLECTION OF THOMAS J. MCKEE.)

Owens, Sothern, Florence, Raymond, and a host of others.

For myself, like some of those already mentioned, I had always been, more or less, a legitimate actor, and the hope of entering the race for dramatic fame as an individual and single attraction never came into my head until, in 1858, I acted *Asa Trenchard* in "Our American Cousin"; but as the curtain descended the first night on that remarkably successful play, visions of large type, foreign countries, and increased remuneration floated before me, and I resolved to be a star if I could. A

resolution to this effect is easily made; its accomplishment is quite another matter.

Art has always been my sweetheart, and I have loved her for herself alone. I had fancied that our affection was mutual, so that when I failed as a star, which I certainly did, I thought she had jilted me. Not so. I wronged her. She only reminded me that I had taken too great a liberty, and that if I expected to win her I must press my suit with more patience. Checked, but undaunted in the resolve, my mind dwelt upon my vision, and I still indulged in day-dreams of the future.

JOSEPH JEFFERSON AS "RIP VAN WINKLE."

HOW I CAME TO PLAY "RIP VAN WINKLE."

DURING these delightful reveries it came up before me that in acting *Asa Trenchard* I had, for the first time in my life on the stage, spoken a pathetic speech; and though I did not look at the audience during the time I was acting,—for that is dreadful,—I felt that they both laughed and cried. I had before this often made my audience smile, but never until now had I moved them to tears. This to me novel accomplishment was delightful, and in casting about for a new character my mind was ever dwelling on reproducing an effect where humor would be so closely allied to pathos that smiles and tears should mingle with each other. Where could I get one? There had been many written, and as I looked back into the dramatic history of the past a long line of lovely ghosts loomed up before me, passing as in a procession: *Job Thornberry*, *Bob Tyke*, *Frank Oatland*, *Zekiel Home spun*, and a host of departed heroes "with martial stalk went by my watch." Charming fellows all, but not for me. I felt I could not do them justice. Besides, they were too human. I was looking for a myth—something intangible and impossible. But he would not come. Time went on, and still with no result.

During the summer of 1859 I arranged to board with my family at a queer old Dutch farmhouse in Paradise Valley, at the foot of Pocono Mountain, in Pennsylvania. A ridge of hills covered with tall hemlocks surrounds the vale, and numerous trout-streams wind through the meadows and tumble over the rocks. Stray farms are scattered through the valley, and the few old Dutchmen and their families who till the soil were born upon it; there and only there they have ever lived. The valley harmonized with me and our resources. The scene was wild, the air was fresh, and the board was cheap. What could the light heart and purse of a poor actor ask for more than this?

On one of those long rainy days that always render the country so dull I had climbed to the loft of the barn, and lying upon the hay was reading that delightful book "The Life and Letters of Washington Irving." I had gotten well into the volume, and was much interested in it, when to my surprise I came upon a passage which said that he had seen me at Laura Keene's theater as *Goldfinch* in Holcroft's comedy of "The Road to Ruin," and that I reminded him of my father "in look, gesture, size, and make." Till then I was not aware that he had ever seen me. I was comparatively obscure, and to find myself remembered and written of by such a man gave me a thrill of pleasure I can never forget. I put down the book, and lay there thinking how proud I was, and ought to be, at the revelation

of this compliment. What an incentive to a youngster like me to go on.

And so I thought to myself, "Washington Irving, the author of 'The Sketch-Book,' in which is the quaint story of Rip Van Winkle." Rip Van Winkle! There was to me magic in the sound of the name as I repeated it. Why, was not this the very character I wanted? An American story by an American author was surely just the theme suited to an American actor.

In ten minutes I had gone to the house and returned to the barn with "The Sketch-Book." I had not read the story since I was a boy. I was disappointed with it; not as a story, of course, but the tale was purely a narrative. The theme was interesting, but not dramatic. The silver Hudson stretches out before you as you read, the quaint red roofs and queer gables of the old Dutch cottages stand out against the mist upon the mountains; but all this is descriptive. The character of *Rip* does not speak ten lines. What could be done dramatically with so simple a sketch? How could it be turned into an effective play?

Three or four bad dramatizations of the story had already been acted, but without marked success. Yates of London had given one in which the hero dies, one had been acted by my father, one by Hackett, and another by Burke. Some of these versions I had remembered when I was a boy, and I should say that Burke's play and performance were the best, but nothing that I remembered gave me the slightest encouragement that I could get a good play out of any of the existing materials. Still I was so bent upon acting the part that I started for the city, and in less than a week, by industriously ransacking the theatrical wardrobe establishments for old leather and mildewed cloth, and by personally superintending the making of the wigs, each article of my costume was completed; and all this too before I had written a line of the play or studied a word of the part.

This is working in an opposite direction from all the conventional methods in the study and elaboration of a dramatic character, and certainly not following the course I would advise any one to pursue. I merely mention the out-of-the-way, upside-down manner of going to work as an illustration of the impatience and enthusiasm with which I entered upon the task. I can only account for my getting the dress ready before I studied the part to the vain desire I had of witnessing myself in the glass, decked out and equipped as the hero of the Catskills.

I got together the three old printed versions of the drama and the story itself. The plays were all in two acts. I thought it would be an improvement in the drama to arrange it in three, making the scene with the specter crew an act by itself. This would separate the poet-

ical from the domestic side of the story. But by far the most important alteration was in the interview with the spirits. In the old versions they spoke and sang. I remembered that the effect of this ghostly dialogue was dreadfully human, so I arranged that no voice but *Rip's* should be heard. This is the only act on the stage in which but one person speaks while all the others merely gesticulate, and I was quite sure that the silence of the crew would give a lonely and desolate character to the scene and add to its supernatural weirdness. By this means, too, a strong contrast with the single voice of *Rip* was obtained by the deathlike stillness of the "demons" as they glided about the stage in solemn silence. It required some thought to hit upon just the best questions that could be answered by a nod and shake of the head, and to arrange that at times even *Rip* should propound a query to himself and answer it; but I had availed myself of so much of the old material that in a few days after I had begun my work it was finished.

In the seclusion of the barn I studied and rehearsed the part, and by the end of summer I was prepared to transplant it from the rustic realms of an old farmhouse to a cosmopolitan audience in the city of Washington, where I opened at Carusi's Hall under the management of John T. Raymond. I had gone over the play so thoroughly that each situation was fairly engraved on my mind. The rehearsals were therefore not tedious to the actors; no one was delayed that I might consider how he or she should be disposed in the scene. I had by repeated experiments so saturated myself with the action of the play that a few days seemed to perfect the rehearsals. I acted on these occasions with all the point and feeling that I could muster. This answered the double purpose of giving me freedom and of observing the effect of what I was doing on the actors. They seemed to be watching me closely, and I could tell by little nods of approval where and when the points hit.

I became each day more and more interested in the work; there was in the subject and the part much scope for novel and fanciful treatment. If the sleep of twenty years was merely incongruous, there would be room for argument pro and con; but as it is an impossibility, I felt that the audience would accept it at once, not because it was an impossibility, but from a desire to know in what condition a man's mind would be if such an event could happen. Would he be thus changed? His identity being denied both by strangers, friends, and family, would he at last almost accept the verdict and exclaim, "Then I am dead, and that is a fact"? This was the strange and original attitude of the character that attracted me.

In acting such a part what to do was simple enough, but what not to do was the important and difficult point to determine. As the earlier scenes of the play were of a natural and domestic character, I had only to draw upon my experience for their effect, or employ such conventional methods as myself and others had used before in characters of that ilk. But from the moment *Rip* meets the spirits of Hendrik Hudson and his crew I felt that all colloquial dialogue and commonplace pantomime should cease. It is at this point in the story that the supernatural element begins, and henceforth the character must be raised from the domestic plane and lifted into the realms of the ideal.

To be brief, the play was acted with a result that was to me both satisfactory and disappointing. I was quite sure that the character was what I had been seeking, and I was equally satisfied that the play was not. The action had neither the body nor the strength to carry the hero; the spiritual quality was there, but the human interest was wanting. The final alterations and additions were made five years later by Dion Boucicault, and will be referred to in their place.

FAILURE IN SAN FRANCISCO.

At the death of my wife, which occurred in March, 1861, I broke up my household in New York, and, leaving three of my children at school, left home with my eldest son for California.

Through the act of an overzealous agent, my engagement in San Francisco was an unmistakable failure. Before my arrival I had been "overbilled," as it is technically termed. If a circus had been coming the placards could hardly have been more numerous. Those fatal documents known as the "opinions of the press" had been so freely circulated that every one was aware not only of what I could do but what I had done, and must therefore take for granted what I was going to do. All power of judging for themselves had been denied both to the public and the local press. I felt that I should fail, and I did fail.

One of the first actors I met on my arrival was Harry Perry. I had known him years before, and we had acted together in our youth. He was standing in front of the theater reading, rather quizzically I fancy, one of the many cards on which were printed the previously mentioned, and, I think, always to be avoided, "opinions of the press." After we had shaken hands, he looked at me with the same old twinkle of mischief in his eye that I had remembered years ago, and said, pointing to the "opinions," "You must have improved greatly since we last met."

HARRY PERRY.

HARRY PERRY was one of the handsomest men on the stage, and a capital actor too. His animal spirits and personal magnetism, however, were the raw materials out of which his popularity was manufactured. In those parts that belonged to a farce light comedian he was quite unequaled. Youth, vivacity, and a ringing laugh made him altogether one of the most captivating fellows in his line. His

FRIEND OLIVIA.

BY AMELIA E. BARR,

Author of "Jan Vedder's Wife," "The Border Shepherdess," "A Daughter of Fife,"
"The Bow of Orange Ribbon," etc.

X.

A MEETING. (Continued.)

O Nathaniel and Olivia it was a charmed journey. The slow rumbling of the wheels in the wagon ruts, the ring of the whetstone sharpening the hay-makers' scythes, the call of the crake in the meadows, the never-ceasing murmur of running water—all these simple sounds made distinct impressions, and yet blended with their own whispered speech as perfectly as if Nature was composing a piece for six voices, and doing it with that delightful perfection of imperfection which charms all discords into sweetest harmony.

Who can blame them if they lingered on their way—if they did not reach Sandys until the sun was westering low on the horizon? Never could hours with just the same bliss come back to them. For love must have the flavor of its circumstances, and these continually change. This afternoon there was the parting with Jenifer Waring, and the expected meeting with Hannah Mettelane, and the long unbroken companionship of their happy journey; and, not without its influence, though unspoken of, the meeting with Anastasia de Burg. Unconsciously, even this had drawn them closer together. Anastasia was a bitter element in herself, but the very act of eluding her special notice turned the bitterness into that sense of elation which is the result of escape from anything evil. Perhaps, indeed, when the light of heaven shows us clearly the pitfalls and dangers of the earth road which led us to the Holy City our sweetest songs of gratitude will be not for the troubles we have conquered, but for those which we have escaped.

When they reached Sandys Olivia was pleasantly surprised. She had expected the house to express by many outward tokens of

figure was lithe and graceful, and, as was said of one of the old light comedians years ago, he had a five-act comedy in each eye. On the occasion I speak of he was quite intoxicated with happiness, being in the height of a honeymoon. His bride was Miss Agnes Land,—now Mrs. Agnes Booth,—a young lady who had lately arrived from Australia, and whose talent and beauty combined with his own made them valuable members of the theatrical profession.

neglect the anxiety and loss which was in its owner's heart. But Hannah Mettelane was not a woman who delighted in ceremonious and mournful symbols of sorrow. Joy in the Lord, and doing her duty in it, was the cheerful law of her life. In all troublous events she could find some comfort, though it was only the negative admission that things might have been worse. She had no children, and Olivia was dear to her. Indeed, the girl had spent much of her life in the low, wide-spreading Mettelane farmhouse under the almost motherly care of Hannah Mettelane.

She was at the open door of Sandys to meet them, her broad beaming face one general smile of welcome; and it fully included Nathaniel, although she had never seen him before. But her woman's heart told her that he was Olivia's lover, and a true love affair was to Hannah Mettelane a true delight.

The house had its usual atmosphere of peace and content and spotless cleanliness. They went into the parlor. The basil pot in the window diffused its restorative aroma, and great nosegays of roses gave a delightful freshness and fragrance to the handsome old room. A cold capon, a dish of curds and cream, some delicate Christ Church tarts, and a bowl of ripe cherries were spread upon the whitest of linen. Red Rhine wine stood by Nathaniel's side, and Aunt Hannah brought with her own hands a foaming pitcher of delicious new milk. She understood also their desire to be everything to each other, and she invented a number of house duties in order to leave Olivia the pleasant task of entertaining her lover.

Nathaniel had told himself that he would not remain many minutes, but he could not resist the enchantment of the hour and the love which glorified it. He remembered his lonely mother affectionately, but yet he lingered until the twilight lost every tinge of color and

lay like a gray veil over the face of sleeping nature. Then he rose to say good-by, and at the same moment Hannah Mettelane entered the room with a letter in her hand. It was from her brother Roger, and the bearer of it was waiting to carry back the answer.

"You see, both of you," she said, "that things are a long way better than we thought for. Roger says he has got a little room, out of the main room, for himself and Asa, and maybe they are n't so bad off after all. Prisons can't be homes, and we must n't expect it of them. Roger is well and having a good conscience, and what is there better than that? There is only one bit of strange news that I can see, and perhaps now it is the best news of all: it's about a young man called John Whitehead; he is got out of prison and bonds of all kinds."

"Free?"

"Ay, my dear lad, free! Set free by God Almighty's own hand."

"Dead?"

"Nay, then, we had better say 'living forever.'"

"Poor John!"

"Not 'poor,' Olivia. No, indeed! Your father writes that the young man was happy to enter death land, and went away in a great state of love and rapture."

"Of what did he die?"

"Of jail fever, and want of all earthly comforts. Roger says his body was worn to ruin and ready to let drop the soul when they reached Appleby."

"He was Mary Whitehead's last son. Her eldest perished in Colchester jail, her second on Bristol common. How I wish I could comfort her! Poor, poor mother!"

"Rich is the mother of holy martyrs, Olivia! It is a great thing to have had three sons with such white consciences. I think she got a better portion for them than the mother of Zebedee's children asked for her sons. And Roger says John Whitehead preached 'the truth' to his fellow-prisoners until his voice failed him, and he could only whisper, softer and softer, 'Jesus Christ! Jesus Christ! Jesus Christ!'"

"He has found the way to rest, to rest forever," said Nathaniel; "and, oh, how glad he must have been when to him the weary controversies of earth suddenly became silent!"

Then Hannah Mettelane, softly weeping, went out of the room, and Olivia lifted her star-like eyes to Nathaniel. Never had the sympathy between them been so sweet and strong. Speechless with emotion, he led her to the open casement. The night incense of the rose beds was wafted across her flower-like face; the ineffable joy of a pure and perfect love made her tremble beneath his light touch. He whispered her name and drew her close to his heart.

Still softer was her answer, "My soul! My soul! I will love thee forever!"

This confession, spontaneous as the perfume of the roses or the song of the nightingale singing by his nest in the sycamore tree, filled Nathaniel with a rapture beyond words. He stood silently gazing into Olivia's eyes, seeing in the dusky gloom her face, white as a lily, shining with the love behind it. Their souls had met before; now they spoke to each other; were as truly one as "the sound in the echo or the thought in the word."

What did they say in that wondrous interval which was but moments yet seemed to stretch infinitely backward and forward? They said everything! though the only audible expression was the long sigh with which the mysterious communing ended.

It blended with the stir of the rising wind in the tree tops and the twittering of some birds in the ivy above the window. Then they were aware of quick footsteps, of voices faintly familiar, of the near and actual invasion of earth into their transient heaven. They looked towards the door and saw Hannah Mettelane enter. She had a lighted candle in her hand, and she was speaking with some one who was close behind her. It was George Fox.

He came forward and took the hands of Nathaniel and Olivia and clasped them together in his own hands. "I am come to put you asunder, children," he said; "but only for a little while. Olivia, thou must go to London and plead with Cromwell himself for thy father's life. There is no lawyer for him but thee. Judge and jury are bought and sold. In this corner of Westmoreland De Burg is stronger than justice; yea, even than thy father's gold."

"George Fox—"

"Nay, Nathaniel, in this matter I will hear no dissent from thee. Verily, I have considered all, and I see that there is no other way."

"At thy word I will go to London, friend George."

"And I will go with thee, friend Olivia. On the third day, early in the morning, be ready." Then, turning to Hannah Mettelane: "I can neither eat nor drink, dear neighbor. I must cross the sands to Ulverstone to-night, and thou knowest the tide will flow at its own time."

"How shall we go, George?"

"Thou must take thy own coach, Olivia. Horses can be changed at all the post-houses, and the hurry is not so great as to cause thee weariness."

"Thou wilt surely go with me, George?"

"Yea; and also friend Jacob Willis and his wife, who are under a constraint of the Spirit to visit the persecuted Friends in the Plymouth colony. Their ship sails from London in two

weeks; so then thou canst help them so far on their journey, and have the while the comfort of their presence."

Then, being pressed by the rising tide, he hurried away, and Nathaniel and Olivia watched him fade into the gray distance. His coming had been like the call of a bugle or the clash of a bell. The fighting, wrestling world was again pressing them hard, and Nathaniel felt it with a special resentment.

"Though the good man rides hard," said Hannah Mettelane, going to the window, "'t will be hurry all if he get across the sands ere the tide catch him."

"George Fox knows the way that he takes. Here is matter of more importance, Mistress Mettelane. It is not fit that Olivia should go to London without me, and in that case it is most fit she goes as my wife."

"I am of your mind, Captain Kelder; and why not?"

"There are two sufficient reasons 'why not,' Aunt Hannah. How can I marry while my father is in prison? 'T would indeed be a great occasion for people to speak ill of me. And, also, I know not if I should be welcome to Nathaniel's people. Indeed, I fear I should bring contention among them."

"You are to marry me, and not my people, Olivia."

"Nay, but I will not marry thee without the good-will of thy people. I will neither go to thy home, nor take thee into my home, without their liking."

From this opinion Olivia could not be persuaded. Although she made no complaint of Lady Kelder's neglect, she was keenly sensitive to it. She was aware that Nathaniel had informed his parents of their intention to marry, and she looked at least for some courteous social recognition of the intention. At this hour Nathaniel also felt it. He found it impossible to make excuses for his mother; and when he arrived at home he had thought over his supposed wrong until his heart was hot within him, and it gave him a certain satisfaction to say bluntly:

"I asked Olivia Prideaux to marry me to-morrow, and she refused. That is because you have not given her the welcome due to my intended wife."

"You must be moon-struck! Or love-struck! Midsummer madness! Marry to-morrow! What are you dreaming about?"

"She goes to London on her father's business, and I wish to go with her."

"I dare be bound you do. Well?"

"Mother, you are cruel. I never knew you so before. If you love me, go and see Olivia to-morrow and tell her she is welcome in Kelderby."

"Shall I tell a lie to pleasure Mistress Prideaux? As to Kelderby, how do you know

that it is mine, or yours, to offer? The selfishness of youth passes my patience! While all Kelderby — house and lands — hangs in the balance; while your father is fighting for his and your rights in a world now strange and hard to him; while I watch and pray, neither sleeping nor eating, weary to fainting with the restless walk that alone relieves my anxious heart, you are dawdling after that Quakeress, who has made us all this sorrow. And then, to crown your injustice, I am cruel because I humble not myself to her. Nathaniel, you are cruel! And I never knew you so before."

She began to weep bitterly, and Nathaniel was not able to endure that spectacle. He soothed her as best he could; he mingled his tears with hers; he found that his brave intention to insist upon Olivia's rights had ended in a reconciliation which left his mother decidedly the gainer. But who can blame him? Brutal is the son who is not vanquished by his mother's tears!

He went to his room utterly worn out with feeling. And yet he could not sleep. The face, the voice, the touch, the influence of Olivia, dominated him. He whispered her name continually. He felt all the bitterness and the sweetness of a love debarred and crossed, and yet potential above and beyond all reasonings. It was unfortunate that he had spoken to his mother at that time. She was miserable in the absence of the baron and in the danger of Kelderby. Indeed, suspense fretted every one; for no word had yet come back from Baron Kelder, nor was any just yet to be expected.

Meanwhile the baron was nearing the end of his journey. He had changed his horse frequently, but never his steady gallop, until he came to the long brick streets of London. For as soon as Odinel Kelder accepted the duty of rescuing his inheritance he forgot his years, and felt not the infirmities belonging to them. In the calm regularity of his late life he had accumulated a reserve of strength which now answered all his demands upon it, and he arrived at his journey's end not more weary than a man in the prime of life might have been. The sun was setting, and he went to an inn at Charing Cross and rested there all night.

Oliver Cromwell was still at Hampton Court, and Kelder's intention was to rise early and try to obtain an audience before the business of the day began. But he fell into a sleep so profound that nothing wakened him until the morning was far advanced. Indeed the business of the day was over when his name was given to the Protector. So little ceremony was then in vogue that the officer in waiting left the door open between the rooms, and Kelder could see his old general walking with a weary, sorrow-laden face in the long gallery.

His name broke Oliver's reverie in two. He

stood still and let it call back to his memory the man who bore it. The recognition came with a smile, and he walked towards the entrance and said: "Is it thou indeed? Come in then, for thou art right welcome." Kelder loved the man, and these friendly, honest words made his heart burn. And as they walked up and down the long gallery, hung with pictures representing the triumphs of Cæsar, they began to talk of the triumphs of the Puritan host, and of the days when they had fought side by side.

"Thy heart was then plain to me, Kelder; but now there are such jealousies and such a spirit of calumny among us, that my condition as to flesh and blood is very hard. Oh, I say so, I do truly."

"I love thee, and thou hast done great things for England."

"Through God. He blessed me therein as it pleased him. For I raised round me such men as thou art, Kelder, who had the fear of God, and made some conscience of what they did."

"We were never beaten—never!"

"That is a matter of praise to God, and it hath this instruction in it—to own men who are religious and godly. Oh, I love men that keep their integrity! men who have a single eye and a whole body full of light." And then Kelder's face answered the face at his side—the strong scarred face, threatening fierceness and rigors to the unfaithful, but tremulous with sensibility and full of love and sadness to those whom he trusted.

After some further discourse they heard the sound of music and singing, and Oliver, still talking, led Kelder into the great hall, where there were two fine organs. Mr. John Milton was playing on the larger, and a choir of boys sang to his music that fine canon, by Ben Jonson:

Look how the winds upon the waves grow tame,
Take up land sounds upon their purple wings,
And catching each from other bear the same,
To every angle of their sacred springs.
So will we take his praise and hurl his name
About the globe in thousand airy rings.

Cromwell was passionately fond of noble music, and it was but a few moments before the mounting joyful strains made him forget speech. He listened with pleased attention until they died away in low wandering symphonies. Then he turned suddenly to Kelder and asked what business in special had brought him to London so soon after his son's visit.

"To undo the business about which my son came"; and, beginning at Nathaniel's visit to De Burg, Kelder told Oliver the whole story precisely as the events of it had happened.

Cromwell's answer was delayed long enough to show a trifle of hesitation. "I like not," he said, "to fasten and to unloose; to say 'yea' and 'nay' as it were with the same breath.

But if a mistake hath been made, then it is the part of wisdom to unmake it with all the speed that may be. And in this matter it is evident that De Burg is without common gratitude and without principle. He will go to Charles Stuart, will he? Yea, if he can. We must look to that; indeed we must."

The wistful, speculative look called into his eyes by revealing music was all gone. He was mentally regarding the man, insensible to the kindness of kindred and the clemency of his country, who would defraud the one and betray the other. The implements of writing were at hand, and in fifteen minutes he had penned a private order to Secretary Thurloe concerning Kelderby, and sent a command to General Selden regarding De Burg.

Dinner waited while he completed this business; but as soon as the letters had been intrusted to the officer in waiting he turned pleasantly to the domestic rite, taking Kelder's company as a matter beyond the necessity of a formal request. The table was, as Nathaniel had described it, plainer and less delicately laid than the table at Kelderby. Wealthy burghers, all over England, dined with as much ceremony and plenty; and excepting the Lady Elizabeth Claypole, none of the party were dressed with any extravagance of material or fashion. Music in an adjoining room filled the pauses in conversation, and doubtless there were times when Cromwell, both from private and public causes, was glad of such excuse as it made for his silence.

But not so with Odinel Kelder. They had too many great and merciful events to recall to each other, and the Lady Elizabeth listened with a wife's interest and delight to Kelder's unaffected praises of her lord. No one could doubt his honesty; and Cromwell, weary of double-dealers, looked with pleasure in the clear face of this true friend. Even Bridget, his spiritually minded daughter, "a woman breathing after Christ, acquainted with temptations, humbled, and not exalted by her father's greatness," could not refrain acknowledging by a kind smile the genuine affection of this single-hearted adherent.

Music and singing passed the time after dinner; a madrigal, by Mr. Lock, being repeated several times to pleasure Kelder, who was able ever afterwards to recall some of its most taking falls. Then there was a psalm sung, which the Protector gave out from the small black psalm-book he had carried through all his campaigns; and after it the ladies retired to their own privacy. But Cromwell and Kelder drew closer to each other. They had a pipe of the Virginian weed, and then walked on the terrace. And as the stars grew larger and brighter they spoke of those sacred personal aspects of religion which are the secret strength of that "spiritual confidence" we are commanded to "restrain not."

The following day Kelder received back his bond, and with it the assurance of the Protector that Kelderby was freely in his own power again. He called for a taper and they burned the parchment silently upon the hearth; but when the blaze was dead and the bond was a shriveled band of gray ashes Cromwell spoke in a low, warning voice:

"Take it not ill what I say,—I know you will not,—or else you will be ruined yet. And truly 't is not I that say it; it is the counsel of the wisest man. 'He that is surety for a stranger shall smart for it: and he that hateth suretiship is sure.'"

But though his affairs were thus comfortably settled, Kelder did not immediately leave London. Cromwell clung to him with a simple regard he found it hard to resist; and nearly every night for three weeks the two men walked the terrace at Hampton Court and talked together of the things which both loved,—“the wisdom of God in a mystery,”—all those extreme thoughts which men seldom care to reach, beyond which no man can go. Perhaps neither had an intellect trained for subtle disputing, nor did they even try to measure with the foot-rule of their understanding the immutable wisdom of God. But in religious matters both had a child's heart, and both were seeking to enter the kingdom of heaven by the gate of spiritual wistfulness.

XI.

OLIVIA AND CROMWELL.

"Prosperity and adversity, life and death, poverty and riches, come of the Lord. . . . Love, and the way of good works, are from him."

. . . "the constant change and transmutation
Of action and of contemplation,
Downward, the Scripture brought from on high,
Upward, exalted again to the sky;
Downward, the literal interpretation,
Upward, the vision and mystery."

LADY KELDER had won a victory over her son, but she had no sense of triumph. What if she got her wish about Olivia, and lost it about Kelderby? The God whom she served was a jealous God, balancing his favors according to the service given. She could not expect too much from him. To clear Kelderby of all its obligations to De Burg, to clear Nathaniel of his obligations to Olivia, was perhaps beyond her desert. Of two evils she must choose the lesser. After hours of restless anxiety she resolved to sacrifice her personal feelings to the more permanent good. If only Kelderby were saved she would try—yes, she would try to accept Olivia.

The mysterious travail of sleep brought her only visions of confusion and anxiety. When the morning came she resolved to call upon Olivia, and judge with her own eyes and intelligence as to the capabilities of the girl for the honor Nathaniel designed her. The concession was a great one; how great Nathaniel could not understand, because the way to Sandys, so hard for his mother, was just the way he liked best of all to go.

"'T is the greatest trial of my life, I believe," she said to herself; and she honestly felt it to be so. On the contrary, Nathaniel was eager to accompany her; but she refused his attendance with a sharpness that had something of reproach in it.

"No, sir! I will take my woman with me. I have no mind to be audience to your veiled sweethearting. Simon, the shrimp-fisher, was here yesterday about his cottage. Give a little of your time to the necessities of the people until your father returns. And to-day there may be a letter from him. 'T is fit surely that either you or I be here to receive it."

Do women dress for men? Never as they do for their own sex. Lady Kelder took from their manifold scented wrappings her very finest garments—an overdress of dark violet velvet, with a quilted satin petticoat of the color of old ivory. A thick gold chain held her pomander case, the case itself being of fretted Moorish work studded with gems. She put it to her nostrils, and with a wretched little laugh said to Jael: "Faith! I shall need the camphor, I know! My heart hath a strange fainting sickness already. And give me my fan, Jael—the one of foreign feathers with the silver handle; and my headdress of ivory satin edged with Flemish point.

She stood a moment before her mirror looking steadily at the woman reflected there—a handsome, resolute woman, tenacious of her own opinions, and finding out for them warranty of Holy Scripture or holy men. When she turned away, Jael gave her a long mantle of black Genoa velvet, and gloves of Spanish leather, richly embroidered and perfumed with orange flowers. Nathaniel was taken with a heartache when he saw her. He understood that the visit, undertaken with so much ceremony, intended little kindness. Yet he felt himself the influence of such royal apparel, and conducted his mother to her coach with a deferential affection which would not be reasoned with.

That morning Olivia was strangely sad and fearful. A journey to London was as great an event then as a journey across oceans is now; and the very necessity for it implied a danger for her father that she had not apprehended. She was employed in preparations for it when

Lady Kelder's step upon the stone passage arrested her attention. Although it was a firm, slow step, Olivia knew at once that it was the step of a woman. She lifted her head and listened, for Hannah Mettelane had gone into Kendal to make some purchases, and she knew that the reception of any stranger must devolve upon her. As the visitor approached she laid down her work and stood up to meet her.

At the same time Gideon threw wide the door, and with some circumstance announced, "Lady Kelder." The two women looked steadily at each other—Olivia's face expectant, indeterminate, ready to reflect instantly a smile or a pleasant light; Lady Kelder's intent, curious, critical, for as yet she had seen Olivia only in a very hurried and cursory manner. Once they had passed each other on Kendal streets, and once, when Lady Kelder called upon Jane D'Acre, Olivia was just taking leave of her friend. She had therefore but a slight remembrance of the girl; now, however, she regarded her with a distinct purpose of examination.

She saw a tall, slender, girlish figure in a white linen dress, with a square collar of English lace encircling her throat. She saw an oval face, delicately rounded; eyes soft, deep, heavenly, with large and solemn gaze; a sweet mouth, rosy and tender; a steady round chin; a color like a wild rose; and a great abundance of soft brown hair. She felt also something of the unknown and unseen in her very simplicity, in the look and air of the girl, which checked every impulse towards what was trifling or disrespectful.

But what the tongue or pen stumblingly or slowly expresses, the eyes see in a moment; and Olivia's appearance and manner was flashed upon Lady Kelder's consciousness as she walked with stately grace from the door to the center of the room. There Olivia met her. Lady Kelder courtesied slightly, expecting from Olivia the deeper reverence due from youth to age. But Olivia's self-respecting creed forbade her to bend her knee to mortal man or woman. She simply extended her hand and said, "Thou art very welcome."

There was then a momentary pause; but Lady Kelder was not a woman who hesitated, or who advanced to the expression of her opinions by roundabout ways. She took the seat offered, and said:

"Mistress Prideaux, I ask you seriously, and I pray you resolve me truly, if 'tis your purpose to make a marriage with Captain Kelder?"

"I have promised to marry him—if God will."

"Oh, indeed! I observe that young people usually make God's will fit their own desires."

"My conscience is a swift witness. I desire only what God wills."

"My son wished to marry you to-day. In such a hurry of self-pleasing, wherein will you discover any will higher than your own?"

"I willed not to marry thy son to-day." 'T was out of a sudden great fear and love that he spoke. If thou knowest the circumstances, thou must understand his desire."

"Indeed, mistress, I do not need you to explain my son to me. And I am agreeably pleased to find that you have so much sense as to put the bride on an offer so beyond all reason. I must tell you that Kelderby itself stands in the 'nay' or 'yea' of the Protector, or else, in a case still worse, the honor of the De Burgs. It is inconceivable that Nathaniel should be wife-seeking when his inheritance, and his home, and the honor of his name stand in such jeopardy."

"Thou must know that my father's honor and my father's estate stand in still more perilous conditions. How then could I take the thought of marriage into my heart at this time?"

"'T is indeed a time laden with strange things, and you must see how inconvenient marrying and giving in marriage must be in the press and hurry of so many great events."

"I think not of it. My heart is wholly set upon my father's peril."

"Nathaniel says that you come not to Kelderby because I ask you not."

"Nathaniel puts my love and his own below what fits their right when he says so. Truly I will not come to Kelderby without thy welcome; but I marry not Kelderby, but Nathaniel Kelder."

"'T is an unnecessary pride that you show. A mother has some rights in the son she has borne."

"A true wife will never wrong them. I seek not Nathaniel Kelder; he seeks me."

"Ah! I thought surely that you loved Nathaniel."

"Thou must not conceive different, and put wrong words in my mouth. But I love him not better than duty and honor and truth. If thou art afraid I am going to wrong thy son in any respect, put all thy fears away. I love not Nathaniel Kelder for myself, but beyond myself. When thou understandest that, thou wilt have a true welcome for me; and perhaps, if God will, I may then come to Kelderby."

"What will you—"

"I will not at all. God wills."

"You must know that the Kelders are a very old family. 'T is indeed a trial when they mate not with their equals. I say nothing against Master Prideaux, who is doubtless an excellent and respectable man."

"I count the probity and sagacity of my

father so much higher than the traditional glory of dead men as living virtue is higher than dead virtue."

"Dead virtues are honorable, mistress."

"Yea, for the dead."

"On this matter truly we may have divided opinions, but if it comes to giving occasion for evil-speaking, we must be at one. There hath been talk and gossip about you and Captain Kelder, and the tongues of others are not in our control. Would it not be better to give the public assurance in regard to your position?"

"If I suffered talk and gossip to move me I should fear the tongue of man more than the eye of God."

"As you like, mistress. For myself, I have ever found my misfortunes more supportable than the comments of my friends on them. To be sure, if you heed not the words said of you—"

"If people speak ill of me, I ask what kind of people they admire, and then it often happens that I am quite consoled. Thou wilt find it in general a comfortable answer. Wilt thou eat and drink with me?"

"I am neither hungry nor thirsty, and my servants and horses wait."

Olivia had risen as she spoke, and Lady Kelder involuntarily followed her example. Young and slight as the girl looked, she carried herself with great dignity. In Sandys the mistress of Sandys was the equal of the mistress of Kelderby. For in her home a woman has immeasurable though intangible advantages. She stands on her own ground, and thereby acquires a moral right which prejudices any antagonist.

The interview was evidently over, and Lady Kelder felt that she had gained nothing from it. The serenity of Olivia had been proof against every little wind of passion or ill-will. She had not lost an inch of ground. She had made no concessions and no promises, and she had told Lady Kelder nothing but what she already knew.

"She has a thousand virtues. If she had a single vice she would be more endurable," said Lady Kelder, as soon as her coach drove away. "Take my fan, Jael, and give me a breath of air. I never thought so well, and so ill, of my sex."

"She hath a name beyond all praise."

"A dowdy, Jael; a very dowdy, in a linen frock. It passes my comprehension. Nathaniel hath seen some of the finest women of the day."

"Well, my Lady, you looked like a queen, and I dare say she was a bit flustered at the meeting with you."

"Flustered! She had the composure of a goddess—I mean, of a saint."

"Was there any falling out with her, my Lady?"

"You might as well try to fall out with a prayer-book, Jael. But I would she had spoken the temper I saw in her eyes."

They were riding swiftly through the estate of Sandys, and Lady Kelder could not but notice the fine order in which park and meadows and cornfields were kept.

"I believe the old goldsmith weeds them as carefully as he dusted his shop and wares. I dare be bound he enters every furrow in his ledger. But 't is a grand old place, that is beyond denying. And 't is possible the proud little maid may have the grace to take nurture. They who live in Kelderby grow Kelder-like. What hinders?"

"That is but a fluffment of talk, my Lady. Everything hinders. I never heard tell in my time of nurture being stronger than nature. The cuckoo lays in the sparrow's nest, and the bird hatched is cuckoo to its last feather. The cuckoo lays in the thrush's nest, but no up-bringing will make it sing the thrush's song. It will cry 'cuckoo' to the long end of its life. The Quakeress may come to the Kelders' nest, but she 'll never change her nature with her name."

"By troth and faith! you are right, Jael. For I came out of Singleton Seat, and though I be married to Kelder's name, I shall be Joan Singleton till I be no more on earth."

Then she was silent awhile, and Jael watched her fingering her pomander chain or the sheath of her fan, and saw how her handsome face grew more and more fretful and disappointed. For Lady Kelder was upright enough with her own heart to be aware that her dislike to Olivia sprang from the girl's trifling peculiarities jarring her own antagonistic peculiarities. She knew quite well that these were a thousand times overbalanced by Olivia's excellences, and that she ought to conquer her unreasonable antipathy; but she did not; she could not.

She had two regrets in regard to her visit: first, that she had worn her best clothing, for Olivia had not seemed to notice it—certainly she had shown no symptom of being in any way subjugated by its splendor; second, that she had been neither as kind nor as disagreeable as she had intended. The sense of failure was with her. She had not conquered Olivia; neither had she irritated her.

When she returned home Nathaniel's face made her still more angry. It hoped and asked so much. The longing curiosity on it was almost painful, and she instantly reflected that it was "that girl" he was anxious and curious about. She spoke of the heat, of the dust, of the weight of her dress, and went to her room

to change it, without a word or a sign which could enable Nathaniel to interpret her. Of course it was cruel, but she felt as if at that hour she did well to be cruel.

Truly she pitied herself as she looked in her mirror and thought of the unpleasant and unprofitable journey she had taken. And Nathaniel's depressed and injured air did not tend to make her at all sorry for him. It was beyond reason that he should add this care to her anxieties about her husband and her home. So when at length he asked, "Did you see Olivia, mother?" she was rather glad to answer gloomily:

"Indeed I saw her."

"I am afraid—dear mother, I hope you have not quarreled with her."

She was standing with her back to him, at the open door of the china closet. She turned round in a passion. "God's mercy on me!" she cried. "May not the girl just as likely have quarreled with me? I will not talk with you about her. If you have no other subject, I will pity myself so far as to be silent."

Then Nathaniel suddenly rose and took a letter from the chimneypiece. "I had forgotten," he said. "'T is from my father, as you may see. The bearer is in the servants' hall."

"And you could think of any other thing or person? You are unworthy of your father, Nathaniel. But I wonder not! I wonder not!"

She was breaking the seal with trembling fingers as she spoke, and after a few moments' consideration of its contents she said, in a low, intense voice: "Kelderby is saved! Kelderby is saved!" And in the moment of her joy she forgot Olivia and fully forgave Nathaniel.

Privately, also, she was now quite reconciled to the events of the morning visit. She was glad there had been no nearer sympathy between Olivia and herself. If she had ever been weak enough to contemplate accepting Olivia as a compromise with the Almighty's sense of her deserts, she had now a double gratification in feeling that both her desires had been granted her. Kelderby was saved, and she had been saved from any promises regarding Olivia. Her home had been given back to her without any mortifying concession on her part. Was she made gentle and kindly by this favor? No! She was human enough to experience immediately one of those heart-hardenings which too often follow a lifted anxiety or a desire granted.

The animus of this unhappy meeting affected Olivia in a manner still more personal and profound. For though she went with Lady Kelder to her coach, and preserved a quiet civility of manner to the last moment of their interview, she was quivering with controlled emotion. And in the solitude of her room the

conflict was renewed. Her enemy was still with her. The battle had only been carried from the outward court to the inner sanctuary of life.

She stood silent, with her hands dropped and clasped before her, and her eyes dilating, as though looking far, far down into the depths of her soul. Lady Kelder had wounded her in every sense. Her love had been questioned, her pride humbled, she had been made to feel that she was the troubler of Nathaniel's house. She had been subjected to a criticism judicially cold; forced suddenly to meet a trial for which she was quite unprepared, and which in her present circumstances appeared a gratuitous sting added to sorrow strange and unavoidable.

At first she could hardly help blaming Nathaniel. He ought to have prevented Lady Kelder's visit; or, if that was impossible, he ought to have accompanied his mother. It was cruel to leave her to face alone the imperious discontent of the disappointed woman. A tumult of outraged feeling made spiritual anarchy in her usually reasonable soul, and sudden flashes of resentment, ending in spontaneous thoughts and plans of revenge, made her cheeks burn and her mouth quiver.

The struggle was harder and longer because her reverent spirit did not suffer her to press into God's presence while under such angry influences. There is a veil between the holiest part of our nature and the Divinity, even as in the visible temple there was a veil before the Shekinah; and Olivia did not dare, with an impatient heart, to pass beyond it. She stood silent until her will had conquered; until pride, anger, hate, revenge, and wounded self-love were lost in that wondrous depth out of which grows the love of God; till she heard the tender question that besought her complaint:

"Thou, then? Who art Thou?"

With streaming eyes and swelling heart she bowed herself, and answered, "Thou knowest me, and all my sorrows."

And yet how sweet it was to tell them over, and to feel in the telling the infinite sympathy of the Divine heart! Then what serene amazement took the place of all fears and of all conclusions! Her trouble grew lighter than a grasshopper, and she rose up from the internal revelation joyfully resigned to all that God willed.

Lady Kelder had passed beyond her horizon, and she looked outward with far-seeing gaze. A glory that never was on sea or land transfigured her face; a contagious warmth, a thrill of positive faith, radiated from her lovely form. For the most real of all splendors, the most wonderful of all miracles, is within us. And those who doubt must consider that the

human soul is the place where two worlds meet—where the Infinite touches the finite.

The reflex influence of this spiritual communion did not desert Olivia for many days. It gave to her final interviews with her lover a delightful peace. She passed over Lady Kelder's visit with a serene indifference that made it hard for Nathaniel to talk of the subject. And yet he understood from Olivia's reticence that the meeting had not been a pleasant one.

On the morning of her departure they stood together in the embrasure of a large window in the parlor. The lower casements were open to catch the dewy perfumes of the garden, and Nathaniel clasped her left hand between his own hands. She was very pale, and the hurry of the preparations for the journey moved her so much that he felt it slightly flutter in his grasp.

Jacob and Jane Willis both sat silent. With heads thrown slightly backward and closed eyes they communed with their own souls, seeking an assurance for their unusual journey. Fox was walking in the garden. He had his hat in his hand, and the sunshine brightened his long fair hair. His meditations were doubtless holy and happy, for his face was calm and reverent, though his eyes were towards the boxwood and the flowers. Hannah Mettelane was ordering the breakfast, and the servants were packing the luggage of the travelers in the boot of the coach. No one was regarding the lovers; they were practically alone.

"My father will doubtless be home in a day or two, beloved; then I shall make every haste to overtake you."

"Thou must not put me before thy duty; but if thou canst wisely come"—and she turned slightly, and raised her eyes to him.

He could not resist the something he saw in them. "You hope, Olivia! You are happy!" And he lifted her face in his hands and kissed it.

"I love thee, Nathaniel. Love always hopes. I will keep thy memory to make my happiness with, dear one. And thou must not doubt. I think true love is a promise, and surely it is God's good pleasure to give what he has promised."

"My soul, I love you! I will love you forever."

"Thou knowest I love thee truly."

"We have chosen each other out of all the world."

"I have chosen thee."

"You will be my wife?"

"I have told thee so."

"But when?"

"That I know not. The rose blooms at its own hour; wouldst thou tear its beauty out of the bud? Love will grow to marriage, dear

one; but shall not love have the glory of its perfect hour?"

"Can I love you more perfectly?"

"I think thou canst—or thou couldst wait with more patience. If thou lovest me for eternity, there is all eternity to love me in. And this time is my father's time. He asks me for the first and best of it. George Fox thinks that I may save his life. Few daughters have such honor given them. When my dear father is out of all trouble—"

"Then you will marry me?"

"When thy father and mother are willing for our happiness, then I will be thy wife. I will love thee first of all, and best of all. I will honor thee with my whole soul, I will love thee perfectly because I so honor thee."

He saw her soul in her eyes; it informed and vivified her face, her white slender throat, her small hands, until the flesh and blood grew translucent and ethereal.

To pure-hearted young girls Heaven gives such transparent fleshly veils; they have no false or sinful thoughts to hide. But as the heart grows hard and insincere the soul puts on many veils, and the light within becomes darkness. Then flesh and blood is simple clay.

When at length the hour of parting came he clasped her to his heart with passionate, sorrowful love. At this moment, with his tears upon her cheeks and his kisses on her lips, she would not wrong his love and hers with any pretenses. She suffered him to see that she wept and loved with him. She murmured sweet broken words of affection; with the long, long gaze of lingering love she watched his tall, dark figure till the green vault of the sycamores hid him from her view.

Great emotion makes many men silent, almost stern; and Nathaniel quickly left Sandys, though Mistress Mettelane urged him to rest there for a little while. For Hannah was one of those women, sweet and homely as honey, who would draw the sting of all men's sorrow into their own breast; and she pitied the young man, hiding with such proud reticence his anxious love and grief.

However, he consoled himself with the reflection that the baron would certainly be home in a day or two. His affairs settled, there was nothing to delay him in London; and Nathaniel raised himself in his stirrups and instinctively searched the horizon for the tall, thin figure he expected to see. The letter already received had made no mention of his return. "I have seen Cromwell, and Kelderby is quite released. I am in comfortable health." That was all, and at the moment of their reception such words had seemed full of all content; but now Nathaniel wished his father had added, "I take the road at once for the north."

In the mean time Olivia pursued her painful journey southward. The quaint old towns where they rested, or baited or changed horses, gave her a momentary interest, and Fox usually took her for a short walk while they were necessarily delayed. But the whole moving drama of streets and lanes and of white roads, along which crept the great pack wagons with their smocked drivers and belled horses, affected her much as the phantasmagoria of a dream. Hour after hour she sat in silence, listening vaguely to the measured talk of Fox and Willis, or, with shut eyes, recalling the fair garden and house of Sandys, and the happy and sorrowful scenes with which they were blended.

When she arrived in London she was suffering much from headache and exhaustion. The last day of the journey had been an agonizing interval, which she had borne with closed eyes and lips. The men scarcely understood her sufferings, and Mistress Willis felt a slight scorn for the girl so much more easily wearied than herself—a woman of sixty years. She reflected, as women usually reflect, upon the superiority of their generation and the decadence of the young people growing up at their side.

They went to the Blue Boar Inn in King street, and for that night Olivia permitted every thought of love or sorrow to escape her. Her slight form succumbed to physical suffering, her heart ached, she was soul weary; when the landlady left her alone in the darkish room she could have cried with joy for the simple relief of solitude. Weary and suffering, she laid her head down upon her pillow, and He gave his beloved sleep; sleep so deep and sweet and long that Fox became uneasy and asked the landlady to visit her guest.

The dusty sunshine of the narrow, noisy street stole in through the crevices of the shutters and lay in golden bars across the great oaken bed. Its spotless linen looked mystically white in the gloom of the veiled day, and the sweet face at rest upon the pillow had the lovelier pallor of life held in the solemn pause of sleep deeper than the tide of dreams. The landlady walked softly to the bedside and stood looking at the sleeping girl. How exquisitely still was the breathing miracle! The small, bow-shaped mouth had the faintest smile; the curtains of the eyes dropped their dark fringes on cheeks softly rounded and white with the warm shadowy white of a lily leaf. A band of sunshine turned the loosened hair into a glory. The small hands were lightly clasped, and, lying on the snowy white of the linen, showed, like the face and throat, the duskish pallor of flesh and blood. All around the bed hung the scent of lavender, bringing thoughts of

warm, sunny gardens to wander about the silent sleeping-place.

"God bless the girl!" the woman whispered. "I was once as young as she be"; and she softly drew the curtains so as to shade her from the light. But at the door she turned and took into her memory the dark, draped bedstead, with its soft, white interior, and the fair young sleeper in its dim, slumberous peace.

The next day Olivia arose thoroughly refreshed, and conscious of that spiritual exaltation which desires to face a crisis, and is straitened till its duty is accomplished. They went early in the day to Hampton Court, but Cromwell had gone to Westminster, so they were delayed for many hours. Indeed, Fox was advising Olivia to return to the city until the morning, when the officer brought him into the Protector's presence. He had not sent in Olivia's name lest the interview should be denied; and when she entered with Fox the Protector looked up with considerable annoyance from the writing on which he was engaged.

"George Fox, you are come here complaining again. I know you are, and I will not suffer it."

"Verily, Oliver; thy conscience tells thee the truth. Thou promised to bring in a bill putting faith before all forms. That would set free hundreds of good men, thy old companions in arms, who now die daily for Christ's sake."

Cromwell listened impatiently. "I will answer anon. Who may this maid be? Thy daughter?"

"She is a daughter of sorrow, and so thy daughter and my daughter and the daughter of all good men." Then he looked at Olivia, and she stepped forward and said:

"My father is in the hands of those that hate him. I pray thee to see that he get justice."

Cromwell looked at her with piercing eyes. Her innocent yet resolute face, lifted so fearlessly to him, touched his heart. But he was in that mood of being "weary in well-doing" into which the best men sometimes fall. He felt as if he had been kind and just and faithful all in vain. At that hour he was tired of doing good only to be unthankfully treated. So he considered the suppliant girl before he answered her. He saw that she was very lovely, and that her dress, though plain, was of the richest material. But he understood from her speech that she was a Quakeress, and like Joseph with his brethren, he hardened his face and spoke roughly to her, though the irrepressible quiver of her closed mouth made his own mouth quiver in sympathy.

"Who is your father?"

"He is called Roger Prideaux."

"Roger Prideaux! I have heard of him

from Baron Kelder. Yes, I will tell you the truth; I have heard all concerning him. He will sit upon two stools, will he? Then if he fall between them he only is to blame. Let the magistrates settle the business as seemeth right to them."

"But thou must not bear the sword in vain. Thou must see that they who judge judge righteous judgment."

She looked confidently into his face; but he shook his head and turned from her towards George Fox.

Fox answered the movement. "Thou must listen, Oliver; for if thou listen not, thy conscience will give thee but a hard time of it. I know that of thee."

At this moment the door opened and Odinel Kelder entered. He came without ceremony, having received such favor of Cromwell, and indeed being there that afternoon on an understanding of their mutual friendship.

Cromwell turned to him instantly. "Come you here, Baron Kelder. Know you this man and this young maiden?"

"Mr. Fox is known to me, and I give him my hand gladly, knowing him also to be a good man. The young maiden I know not."

"I am the daughter of Roger Prideaux; and I have come here to speak with the man whom God has set over England, that he may try with his judgment whether my father be worthy of imprisonment or not."

"Truly, Roger Prideaux is a worthy man. I have said so to my lord general before this. Mercy, in his case, cannot err."

"I ask not for mercy; my father hath done nothing worthy of punishment. I ask," and she looked straight into Cromwell's eyes—"I ask thee for justice. And thou canst not judge justly if thou wilt not hear the truth."

"You are a brave maid, you are indeed; and you shall tell me the truth, and I will see how it fits with what my friend Kelder has said before."

She looked then into Kelder's face, and that moment the baron forgave his son for loving her. Beginning at that fatal day when John de Burg begged his life at her hand, she told Cromwell the whole story. The words came with the force of simple truth. No oath and no witnesses could have certified them as she herself did—her upright air, her clear eyes, her steady voice, her modest confidence.

When she ceased speaking Cromwell turned to Baron Kelder, and Kelder said instantly, "I believe that Mistress Prideaux has spoken no word that is not true." And he looked so kindly at her that she had to drop her eyes to hide the mist of grateful pleasure that gathered there. But Cromwell answered: "This is a judgment very difficult, besides being a business that nearly concerneth all good men

that are loyal. I will take it into my own consideration."

"That is the utmost of my desire. The Lord chose thee to judge this nation; truly, then, I may put my confidence in thee."

"I think so, I do indeed! I will see that none do Roger Prideaux wrong, though I judge him not altogether innocent, for I fear that his heart hath hankered after the man Charles Stuart. But for you, little maid, the Lord hath given you wisdom and comeliness, and, I doubt not, a knowledge of himself. Come, I will take you to those who will refresh you, for you are weary, indeed you are; and I have daughters also,—four of them,—whom God knows I love with a most tender love."

All the sternness went out of his eyes, his face beamed; he stretched out his hand, and with a frank modesty Olivia laid her hand in it. As she did so she turned her pale, luminous face on Baron Kelder, saying:

"Thou didst bear a true witness. I am thy loving debtor for it."

"Nay, then, you must pay my son Nathaniel in loving-kindness." Cromwell had her left hand, she gave Kelder her right, and he bowed his head and touched the white palm with his lips, while Fox watched the little tableau with a gaze that had a blessing in it.

In a few moments the Protector returned to his visitors, and his first words had an irritable tone in them. "What is your concern now, George? You are ever a hard preacher."

The two greatest men of their day stood side by side, searching each other with glances that went beyond all visibles. "My concern, Oliver, is no less than the lives of the two thousand Quakers in prison for conscience' sake; and if the question is too hard for thee, so much more the pity of it! If it be a cross—"

"Talk you of the cross, as if a Quaker had a special bearing of it! I trow not. I also have crosses on the one side and the other, I am sure. And, also, better men than myself bearing burdens for England, with small thanks. Listen to this, and let Quakers learn therefrom the patience I wish they had, I am sure I do."

Then he took from his pocket a letter and opened it with some passion. "Here is a man that knew his calling from the first to this day. What man has discharged his duty better than Robert Blake? Has he not driven away the Dutch, and made Popish kings do right to Protestants, and the Pope himself pay 20,000 pistoles good penance money, and taught justice to the deys of Tunis and Tripoli?—a hard lesson truly; and yet in the midst of all these triumphs he writes thus to me: he writes with tears, he does indeed, out of a mind troubled and a body sick as ever was, yet withal as a man fearing God very bravely. I tell you the

Quakers are the Little-Faiths of their generation. Tell them that, George, and also tell them what Robert Blake says in his weakness and triumph"; and he stood still and struck the paper with his right hand, before he read the words aloud:

"My only comfort is that we have God to lean upon, although we walk in darkness and see no light—consoling myself in the mean time in the Lord, and in the firm purpose of my heart with all faithfulness and sincerity to discharge the trust reposed in me.

"I tell thee, George Fox, I myself have a service fullest of trials ever poor creature was set upon. The cross! The cross! Surely, if we turn ourselves upwards or downwards, without or within us, everywhere the cross is always waiting."

"Thy words do not meet the witness of my conscience."

"George Fox, Quaker consciences are too troublesome. I protest they are. Under this pretense they will not fight, nor will they pay tithes, nor will they swear. So many scruples! Such bad principles! Such provokingly good practice! I know not—no, nor doth any other know—what is best to give them. I would they could at least suffer in silence. I say, suffer in silence."

"Testimonies are required of them. Thou knowest well that there is not one instance in which even the weakest woman has denied or concealed her faith for fear of man's scorn, or the torture of the flesh. Bear in thy mind, also, that many of these sufferers are thy old comrades—fierce, strong, brave men, such as thou didst make them; yet when did any of them revenge himself? Verily, not one."

"If they would speak what any man might know! But this doctrine is full of hidden things—of mysticism."

"Out of the steel ranks of thy own Ironsides have come the mystics of England. These men who have laid down their swords for Christ's sake once followed thee through many a red lane of battle. And though God permitteth thee to be merciful, doubtless persecution is of his will. For 't is a deep plow, Oliver; it goes to the bottom of a man's nature. It goes far below all dogma. It goes below even the senses and the appetites. It summons the soul to do battle against the arm of flesh. Verily, I have seen the black heart of the sensualist burned clean and white in this fire."

"Then, George, if it be such a fire of God's kindling, I will not put it out. I will not, indeed."

They had been walking as they talked together, and had passed out of the smaller room into the great hall. Some one was at one of

the organs, and through all their conversation a soft fugue had kept up a mysterious and melodious dialogue. Suddenly there was an intrusion of metallic sounds, the clash of cymbals and tinkle of triangles, and accompanying these the roll of a drum. Cromwell became silent and stood still listening. In some occult way the half-barbaric sounds carried each mind far off to lands near sunrise, and while the spell lasted a clear voice in musical recitative filled the hall:

"Belshazzar the king gave a great feast to a thousand of his lords."

With a white, stern face Cromwell heard, and then led the way back to the smaller room. He was strangely troubled. For a few minutes he did not speak, and neither Fox nor Kelder felt any impulse to break the strained silence. The strong voice rising and falling to the ebb and flow of the tingling, rolling waves of sound was still faintly audible. Kelder stood as if listening to its echoes. Fox was listening also, but not to any echo of mortal sound. Cromwell broke the pause in a voice that had a singular unreality about it.

"'T is beyond our knowing," he said, "where dreams come from; yet 't is beyond my doubting that I dreamed last night of the king Belshazzar and the hand that wrote his death warrant. Verily, it is the unseen that terrifies us, Kelder. It was not the hand, but the hand being without the body, that froze the king and nobles with unearthly terror. Come, let us go and eat, for I am weary with many thoughts and cares."

They passed without further words into a more private part of the palace, and entering a room saw Olivia sitting between Bridget Ireton and Mary Fauconberg, the Protector's daughters. The Lady Elizabeth Cromwell stood at the spread table, but her eyes were fixed upon Olivia, whose face had an expression of holy enthusiasm upon it. There was evidently an interruption; but no allusion was made to the circumstance until the whole party sat in the summer twilight.

Then the Lady Cromwell said to her husband, "My dear, your coming in prevented our full knowledge of the finest words ever I did hear; and I think Mistress Prideaux will do us all great service if she make us audience to them."

Every one looked at Olivia, and with a slightly heightened color she said, "They were the last words of James Naylor, who truly died for the truth, though men perceived it not for the veil of mortal frailty. Yet in the end God suffered him the glory and peace of his presence."

"Naylor! The man was adjudged by the best in the land to be a blasphemer against God,"

answered Cromwell; but his speech was slow and heavy.

"The best in the land!" cried Fox. "Were they indeed the appointed keepers of God's honor? Thou knowest better, Oliver. 'T was a matter of conscience, and belonged to God's tribunal."

"His claim was beyond humanity, George."

"His punishment was beyond humanity. Foolish women, led away by the marvelous beauty of his comely countenance and by the music of his eloquent tongue, gave him honor he never claimed. Doubtless he ran out foolishly into imaginations, but he said not that he was Christ; only, that Christ dwelt within him. Such a word was too great to be carnally judged." And Fox looked upward, as if appealing to the God of justice.

"God may pardon such judges, but I would surely mete them their own measure," said Baron Kelder—"the red-hot iron through the tongue and on the brow, and the six hundred and twenty lashes which tore the body till the flesh would scarce hold the vital organs. 'T was an infamy of cruelty fathered upon the God of mercy and the Lamb who taketh away the sins of the world. And there was none to pity him."

"Odinel Kelder, I was in close prison myself at the time. Had I been a free man I would have besought our kind Oliver for the mercy that is truly in his heart. I would have pleaded for James Naylor with both God and man."

"He went too far, George, he did indeed; and he deserved some punishment, he did; I say so. Yet truly I interfered, even to the checking of Parliament with stiff words, about James Naylor."

"Well, then, he is now with God."

"I knew not that he was dead."

"Yea, gone away from all who loved and all who hated him and did him wrong. His end was in great peace, and in the passing over he breathed forth his soul in music; slowly, with his mutilated tongue, speaking the great words in his adoring soul. Olivia, let us hear the last thoughts of this blasphemer, whom the Parliament of England thought it did well to torture."

Then Olivia stood up, and resting one hand on Fox's shoulder she repeated the hymn to which James Naylor dismissed his soul.

There is a spirit which I feel that delights to do no evil, nor to revenge any wrong, but delights to endure all things in hope to enjoy its own in the end.

It sees to the end of all temptations.

As it bears no evil in itself, so it conceives none in thoughts to any other.

If it be betrayed it bears it, for its ground and spring is the mercy and forgiveness of God.

Its crown is meekness.

Its life is everlasting love unfeigned.

It takes its kingdom with entreaty and not with contention, and keeps it by lowliness of mind.

In God alone it can rejoice, though none else regard it or can own its life.

It is conceived in sorrow and brought forth without any to pity it.

Nor doth it murmur at grief and opposition.

It never rejoiceth but through suffering, for with the world's joy it is murdered.

I found it alone, being forsaken.

I have fellowship therein with them who lived in dens and desolate places of the earth.

Who through Death obtained the Resurrection, and Eternal Holy Life.

To these majestic words Olivia's sympathetic voice rose and fell in musical cadence. Her eyes sought heaven, and her face was like the glowing page of some holy book. Kelder kept back tears with difficulty, Oliver's sorrow-laden eyes were cast down with the trouble in them, Fox's face and attitude were that of triumphant rejoicing. But no one made any comments. Indeed, the first word spoken was irrelevant to the matter.

"What name did George Fox call you by, little maid?"

"I am named Olivia."

"For this life we have the same name—Olivia." He said the word slowly, with a lingering, gentle emphasis. "My daughter, know you the secret, sacred name? the new name of His adoption?" They looked at each other steadily, as if seeing with that sight which cleaveth flesh and blood and discerns spiritually.

Then Cromwell dropped her hand and walked on to the terrace with Odinel Kelder, and the women bade Olivia and Fox farewell, with all the pleasant confusion and iterated words that are the womanly conception of the rite.

Olivia was exceedingly weary, but so upheld by the certainty of Cromwell's interference in her father's case that she did not desire to rest until she had written to Hannah Mettelane, in whose letter she put these few lines to Nathaniel:

MY DEAREST HEART: This is to tell thee that all has gone well, and that we leave London for Sandys in two days. Mistress Caroline Peel and her daughter Sybil return in our company to the north. Nathaniel, know truly that all the space between us is full of loving thoughts for thee. I say thy name often, and whenever it passes my lips I kiss it on them for thee. To-day I saw thy father with Cromwell, and the meeting was pleasant, but I surely think that I shall see thee ere thou see him. For Cromwell stays him in London for love, but love so much stronger hastens me back to Sandys and to thee. So then, am I not as I have truly promised to be, ever thine

OLIVIA.

Amelia E. Barr.

THE SLAVE-TRADE IN THE CONGO BASIN.

BY ONE OF STANLEY'S PIONEER OFFICERS.

ILLUSTRATED AFTER SKETCHES FROM LIFE BY THE AUTHOR.

WITH STANLEY.

CANE HANDCUFF.

THE heart of Africa is being rapidly depopulated in consequence of the enormous death-roll caused by the barbarous slave-trade. It is not merely the bondage which slavery implies that should appeal to the sympathies of the civilized world; it is the bloodshed, cruelty, and misery which it involves.

During my residence in Central Africa I was repeatedly traveling about in the villages along the Congo River and its almost unknown affluents, and in every new village I was confronted by fresh evidences of the horrible nature of this evil. I did not seek to witness the sufferings attendant upon this traffic in humanity, but cruelties of all kinds are so general that the mere passing visits which I paid brought me in constant contact with them.

It is not alone by the Arabs that slave-raiding is carried on throughout Central Africa. With respect to slavery in the Congo Free State, the western limit of the slave-raiding operations of the Arabs is the Aruwihimi River, just below Stanley Falls, but intertribal slavery exists from this point throughout the State to the Atlantic Ocean. During my six years' residence on the Congo River I saw but little of the Arabs, and therefore in this article I am detailing only my experiences bearing upon the subject of slavery among the natives themselves.

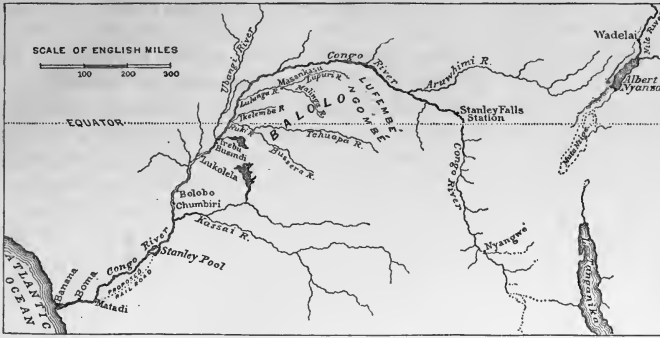

I first went to the Congo in 1883, and traveled without delay into the interior. Arriving at Stanley Pool, I received orders from my chief, Mr. Henry M. Stanley, to accompany him up river on his little boat the *En Avant*. Stanley at that time was engaged in establishing a few posts at important and strategic points along the upper river. Lukolela, eight hundred miles in the interior, was one decided upon, and I had the honor of being selected by him as chief of this post. As no white man had ever lived there before, I had a great deal of work in establishing myself. The position selected for our settlement

was a dense forest, and until now it had been more familiar with the trumpeting of elephants and the cry of the leopard than with human beings. At first the natives rather objected to my remaining at all, and stated their objections to Stanley. Said they: "We have promised to allow you to put a white man here, but we have been talking the matter over, and we have concluded it would be better to put your white man somewhere else. We, the assembled chiefs, have held a council, and have come to the conclusion that it is not desirable to have such a terrible creature in the district." Stanley said: "Why, what is there in him that you object to? You have never seen him." (I had not yet landed, being at that time very sick and unable to leave the boat.) They said, "No, we have not seen him, but we have heard about him." Stanley then said, "What have you heard about him?" They replied: "He is half a lion, and half a buffalo; has one eye in the middle of his forehead, and is armed with sharp, jagged teeth; and is continually slaughtering and devouring human beings. Is this so?" Stanley answered them, "I did not know that he was such a terrible creature; but I will call him, and let you judge for yourselves." Upon my appearing this illusion was immediately dispelled, as, after suffering several days from an acute sickness, I really did not look very formidable or bloodthirsty.

Here I lived for twenty months, the only white man, so that I had every opportunity of studying native character and customs.

NATIVE LIFE.

IN order to place before the reader a picture of savage life untouched by civilization, I could hardly do better than lightly sketch a typical village at Lukolela as I have intimately known it. The whole district contains about three thousand people, the land occupied by them extending along the bank for two miles, the villages being dotted through this distance in clusters of fifty or sixty houses. The houses are built on each side of one long street or in open squares. They are roofed with either palm leaves or grass, the walls being composed of split bamboo. Some of these dwell-

THE CONGO BASIN.

ings contain two or three compartments, with only one entrance; while others are long structures, divided up into ten or twelve rooms, each with its own entrance from the outside. At the back of these dwellings are large plantations of banana trees; while above them tower the stately palm trees, covering street and hut with their friendly shade.

It is in the cool of the early morning that the greater part of the business of the village is transacted. Most of the women repair, soon after six, to their plantations, where they work until noon, a few of them remaining in the village to attend to culinary and other domestic matters. Large earthen pots, containing fish, banana, or manioc, are boiling over wood fires, around which cluster the young boys and girls and the few old men and women enjoying the heat until the warm rays of the morning sun appear. Meanwhile the fishermen gather up their traps, arm themselves, and paddle off to their fishing-grounds; the hunters take their spears or bows and arrows and start off to pick up tracks of their game; the village blacksmith starts his fire; the adze of the carpenter is heard busily at work; fishing and game nets are unrolled and damages examined; and the medicine man is busy gesticulating with his charms. As the sun rises the scene becomes more and more animated; the warmth of the fire is discarded, and every department of industry becomes full of life—the whole scene rendered cheerful by the happy faces and merry laughter of the little ones as they scamper here and there engaged in their games.

At noon the overpowering heat of the tropical sun compels a cessation of work, and a lazy quietude prevails everywhere. Then all the shady nooks of the village are filled with groups who either sleep, engage in conversation, or pass their time in hair-dressing or in attending to some other toilet matter which native etiquette demands, such as shaving off eyebrows or pulling out eyelashes—an operation which is also extended to all hairs on the face except those on the chin, which are plaited in the form of a rat's tail. The closer the finger nails are cut, the more fashionable is it thought. At the finger ends the nails are cut down to the quick, and any one posing as either beau or belle always has some of the finger and toe nails pared entirely off.

The midday meal is now eaten, the whole village assuming an air of calmness, broken only by the occasional bursts of boisterous mirth from groups engaged in discussing the merits of the native wine.

All mankind have the same weakness in requiring at times drink stronger than water. Nature has provided the African with the juice of the palm tree, a most palatable beverage, resembling when fresh a very strong lemon soda, but intoxicating in its effects. It is obtained in the following way: the villagers in charge of this particular industry climb the tree, trim away some of the leaves, and then bore three or four holes, about half an inch in diameter, at the base of the frond, to the heart of the tree. From each of these holes will flow each day about half a pint of juice, a small gourd being first placed to receive it. The contents of these gourds are collected every morning. This beverage is called by the natives *malafu*, and is well known to all European travelers as palm wine.

Between three and four o'clock the village again resumes its air of activity, which is kept up until sundown. In this region, being close to the equator, the sun sets at six o'clock.

WAR HORN AND OTHER MUSICAL INSTRUMENTS.

All tools are put away, and work is suspended. The fires are again lighted, mats are brought out and spread about, and the principal meal of the day is eaten; after which the natives gather around the fire again and talk over the events of the day and the plans for the future. The young people repair to the open places and indulge in their native dances until midnight.

This dancing at night is a sight to be remembered. The performers arrange themselves in circles and dance in time to the

THE EFFECT OF SLAVERY.

THIS is a fair picture of the life carried on from day to day in a hundred Congo villages, and but for the existence of slavery it would continue undisturbed from one year's end to another. It is the presence of the slave in the village that brutalizes the otherwise harmless and peaceful community. It is the baneful influence that gives one man the power of life and death over the wretch he has purchased that impels the savage instinct to spill in executions and ceremonies the life-blood

of the man, woman, or child he has obtained—perhaps in exchange for a few brass rods or two or three yards of Manchester cloth. Here at Lukolela, for instance, I had hardly settled down in my encampment when I was introduced to one of those horrible scenes of bloodshed which take place frequently in all the villages along the Congo, and which will be enacted so long as the life of a slave is counted as naught, and the spilling of his blood of as little account as that of a goat or a fowl.

In this particular instance the mother of a chief having died, it was decided, as usual, to celebrate the event with an execution. At the earliest streak of dawn the slow, measured beat of a big drum announces to all what is to take place, and warns the poor slave who is to be the victim that his end is nigh. It is very evident that something unusual is about to happen, and that the day is to be given up to some ceremony. The natives gather in groups and begin studiously to arrange their toilets, don their gayest loin-cloths, and ornament their legs and arms with bright metal bangles, all the time indulging in wild gesticulations and savage laughter as they discuss the coming event. Having taken a hasty meal, they produce from their houses all available musical instruments. The drums are wildly beaten as

CONGO KNIVES.

beating of the drums, which is their only accompaniment, and occasionally break out into native songs. The surrounding tropical scenery stands outlined in bold relief, the nearer trees occasionally catching the lurid light of the fires, which also strikes on the gleaming bodies of the dancers, making a violent contrast of light and shade, the whole scene being rendered impressive by the wild but harmonious music.

At midnight, when all the villagers have retired to their huts, stillness reigns, broken only at times by the weird call of a strange bird, the cry of a prowling leopard or some other wild animal, and the varied sounds of tropical insects.

brate the event with an execution. At the earliest streak of dawn the slow, measured beat of a big drum announces to all what is to take place, and warns the poor slave who is to be the victim that his end is nigh. It is very evident that something unusual is about to happen, and that the day is to be given up to some ceremony. The natives gather in groups and begin studiously to arrange their toilets, don their gayest loin-cloths, and ornament their legs and arms with bright metal bangles, all the time indulging in wild gesticulations and savage laughter as they discuss the coming event. Having taken a hasty meal, they produce from their houses all available musical instruments. The drums are wildly beaten as

groups of men, women, and children form themselves in circles and excitedly perform dances, consisting of violent contortions of the limbs, accompanied with savage singing and with repeated blasts of the war horns, each dancer trying to out-do his fellow in violence of movement and strength of lung.

About noon, from sheer exhaustion, combined with the heat of the sun, they are compelled to cease; when large jars of palm wine are produced, and a general bout of intoxication begins, increasing their excitement and showing up their savage nature in striking colors. The poor slave, who all this time has been lying in the corner of some hut, shackled hand and foot and closely watched, suffering the agony and suspense which this wild tumult suggests to him, is now carried to some prominent part of the village, there to be surrounded and to receive the jeers and scoffs of the drunken mob of savages. The executioner's assistants, having selected a suitable place for the ceremony, procure a block of wood about a foot square. The slave is then placed on this, in a sitting posture; his legs are stretched out straight in front of him; the body is strapped to a stake reaching up the back to the shoulders. On each side stakes are placed under the arm-pits as props, to which the arms are firmly bound; other lashings are made to posts driven into the ground near the ankles and knees.

A pole is now planted about ten feet in front of the victim, from the top of which is suspended, by a number of strings, a bamboo ring. The pole is bent over like a fishing-rod, and the ring fastened round the slave's neck, which is kept rigid and stiff by the tension. During this preparation the dances are resumed, now rendered savage and brutal in the extreme by the drunken condition of the people. One group of dancers surround the victim and indulge in drunken mimicry of the contortions of face which the pain caused by this cruel torture forces him to show. But he has no sympathy to expect from this merciless horde.

Presently in the distance approaches a company of two lines of young people, each holding a stem of the palm tree, so that an arch is formed between them, under which the executioner is escorted. The whole procession moves with a slow but dancing gait. Upon arriving near the doomed slave all dancing, singing, and drumming cease, and the drunken mob take their places to witness the last act of the drama.

LOIN-CLOTH AND EXECUTIONER'S KNIFE AND HAT.

An unearthly silence succeeds. The executioner wears a cap composed of black cocks' feathers; his face and neck are blackened with charcoal, except the eyes, the lids of which are painted with white chalk. The hands and arms to the elbow, and feet and legs to the knee, are also blackened. His legs are adorned profusely with broad metal anklets, and around his waist are strung wild-cat skins. As he performs a wild dance around his victim, every now and then making a feint with his knife, a murmur of admiration arises from the assembled crowd. He then approaches and makes a thin chalk mark on the neck of the fated man. After two or three passes of his knife, to get the right swing, he delivers the fatal blow, and with one stroke of his keen-edged weapon severs the head from the body.

The sight of blood brings to a climax the frenzy of the natives: some of them savagely puncture the quivering trunk with their spears, others hack at it with their knives, while the remainder engage in a ghastly struggle for the

NATIVE WEARING APPAREL.

possession of the head, which has been jerked into the air by the released tension of the sapling. As each man obtains the trophy, and is pursued by the drunken rabble, the hideous tumult becomes deafening; they smear one another's faces with blood, and fights always spring up as a result, when knives and spears are freely used. The reason for their anxiety to possess the head is this: the man who can retain that head against all comers until sundown will receive a present for his bravery from the head man of the village. It is by such means that they test the brave of the village, and they will say with admiration, speaking of a local hero, "He is a brave man; he has retained two heads until sundown."

When the taste for blood has been to a certain extent satisfied, they again resume their singing and dancing while another victim is prepared, when the same ghastly exhibition is repeated. Sometimes as many as twenty slaves will be slaughtered in one day. The dancing and general drunken uproar is continued until midnight, when once more absolute silence ensues, in utter contrast to the hideous tumult of the day.

I had frequently heard the natives boast of the skill of their executioners, but I doubted their ability to decapitate a man with one blow of the soft metal knives they use. I imagined they would be compelled to hack the head from the body. When I witnessed this sickening spectacle I was alone, unarmed, and absolutely powerless to interfere. But the mute agony of this poor black martyr, who was to die for no crime, but simply because he was a slave,—whose every piteous movement was mocked by frenzied savages, and whose very death throes gave the signal for the unrestrained outburst of a hideous carnival of drunken savagery,—appealed so strongly to my sense of duty that I decided upon preventing by force any repetition of this scene. I made my resolution known to an assembly of the principal chiefs, and although several attempts were made, no actual executions took place during the remainder of my stay in this district.

THE VILLAGE CHIEFS.

A FEW words are necessary to define the position of the village chiefs as the most important factors in African savage life; especially as in one way or another they are intimately connected with the worst features of the slave system, and are responsible for nearly all the atrocities practiced on the slave.

The so-called chiefs are the head men of a village, and they rank according to the number of their warriors. The title of chieftain is not hereditary, but is gained by one member of a tribe proving his superiority to his fellows. The most influential chief in a village has necessarily the greatest number of fighting men, and these are principally slaves, as the allegiance of a free man can never be depended upon. A chief's idea of wealth is—slaves. Any kinds of money he may have he will convert into slaves upon the first opportunity. Polygamy is general throughout Central Africa, and a chief buys as many female slaves as he can afford, and will also marry free women—which is, after all, only another form of purchase.

MODES OF TORTURE.

ALL tribes I have known have an idea of immortality. They believe that death leads but to another life, to be continued under the same conditions as the life they are now leading; and a chief thinks that if when he enters into this new existence he is accompanied by

a sufficient following of slaves he will be entitled to the same rank in the next world as he holds in this. From this belief emanates one of their most barbarous customs—the ceremony of human sacrifices upon the death of any one of importance. Upon the decease of a chief, a certain number of his slaves are selected to be sacrificed, that their spirits may accompany him to the next world. Should this chief possess thirty men and twenty women, seven or eight of the former and six or seven

NGOMBÉ SHIELD.

LOLO MAN.

of the latter will suffer death. The men are decapitated, and the women are strangled. When a woman is to be sacrificed she is adorned with bright metal bangles, her toilet is carefully attended to, her hair is neatly plaited, and bright-colored cloths are wrapped around her. Her hands are then pinioned behind, and her neck is passed through a noose of cord; the long end of the cord is led over the branch of the nearest tree, and is drawn taut at a given signal; and while the body is swinging in mid-air its convulsive movements are imitated with savage gusto by the spectators. It often happens that a little child also becomes a victim to this horrible ceremony, by being placed in the grave alive, as a pillow for the dead chief. These executions are still perpetrated in all the villages of the Upper Congo.

But the life of the slave is not only forfeited at the death of the chief of the tribe in which fate has cast his lot. Let us suppose that the tribe he is owned by has been maintaining an internecine warfare with another tribe in the same district. For some reason it is deemed politic by the chief to bring the feud to an end, and a meeting is arranged with his rival. At the conclusion of the interview, in order that the treaty of peace may be solemnly ratified, blood must be spilled.

A slave is therefore selected, and the mode of torture preceding his death will vary in different districts. In the Ubangi River district the slave is suspended head downwards from the branch of a tree, and there left to die. But even more horrible is the fate of such a one at Chumbiri, Bolobo, or the large villages around Irebu, where the expiatory victim is actually buried alive with only the head left above the ground. All his bones have first been crushed or broken, and in speechless agony he waits for death. He is usually thus buried at the junction of two highways, or by

the side of some well-trodden pathway leading from the village; and of all the numerous villagers who pass to and fro, not one, even if he felt a momentary pang of pity, would dare either to alleviate or to end his misery, for this is forbidden under the severest penalties.

HOW THE NATIVES ARE ENSLAVED.

THE varying fortunes of tribal warfare furnish the markets with slaves whose cicatrization marks show them to be members of widely differing families and distant villages. But there are some tribes, and these the most inoffensive and the most peaceful, whose weakness places them at all times at the mercy of their more powerful neighbors. Without exception the most persecuted race in the dominions of the Congo Free State are the Balolo tribes, inhabiting the country through which the Malinga, Lupuri, Lulungu, and Ikelemba rivers flow. I may here mention that the prefix "Ba" in the language of these people implies the plural; for instance, Lolo would mean one Lolo—Ba-lolo signifying Lolo people. These people are naturally mild and inoffensive. Their small, unprotected villages are constantly attacked by the powerful roving tribes of the Lufembé and Ngombé. These two tribes are voracious cannibals. They surround the Lolo villages at night, and at the first signs of dawn pounce down upon the unsuspecting Balolo, killing all the men who resist and catching all the rest. They then select the stronger portion of their captives, and shackle them hand and foot to prevent their escape. The remainder they kill, distributing the flesh among themselves.

LOLO WOMAN.

A SLAVE-SHED.

As a rule, after such a raid they form a small encampment; they light their fires, seize all the bananas in the village, and gorge upon the human flesh. They then march over to one of the numerous slave-markets on the river, where they exchange the captives with the slave-traders of the Lulungu River for beads, cloth, brass wire, and other trinkets. The slave-traders pack the slaves into their canoes and take them down to the villages on the Lulungu River where the more important markets are held. Masankusu, situated at the junction of the Lupuri and Malinga tributaries, is by far the most important slave-trading center. The people of Masankusu buy their slaves from the Lufembé and Ngombé raiders, and sell them to the Lulungu natives and traders from down river. The slaves are exhibited for sale at

Masankusu in long sheds, or rather under simple grass roofs supported on bare poles. It is heartrending to see the inmates of one of these slave-sheds. They are huddled together like so many animals.

IN THE SLAVE-SHED.

THE accompanying pictures, from sketches which I took at Masankusu, will give some idea of the suffering which is endured by captives in numberless slave-markets. They are hobbled with roughly hewn logs which chafe their limbs to open sores; sometimes a whole tree presses its weight on their bodies while their necks are penned into the natural prong formed by its branching limbs. Others sit from day to day with their legs and arms maintained in a fixed position by rudely constructed stocks, and each slave is secured to the roof-posts by a cord knotted to a cane ring which either encircles his neck or is intertwined with his woolly hair. Many die of pure starvation, as the owners give them barely enough food to exist upon, and even that they grudge them. These hungry creatures form indeed a truly pitiable sight. After suffering this captivity for a short time they become mere skeletons. All ages, of both sexes, are to be seen: mothers with their babes; young men and women; boys and girls; and even babies who cannot yet walk, and whose

A CAPTIVE.

mothers have died of starvation, or perhaps been killed by the Lufembé. One seldom sees either old men or old women; they are all killed in the raids: their marketable value being very small, no trouble is taken with them.

Witnessing groups of these poor, helpless wretches, with their emaciated forms and sunk-en eyes, their faces a very picture of sadness, it is not difficult to perceive the intense grief that they are inwardly suffering; but they know too well it is of no use to appeal for sympathy to their merciless masters, who have been accustomed from childhood to witness acts of cruelty and brutality, so that to satisfy their insatiable greed they will commit themselves, or permit to be committed, any atrocity, however great. Even the pitiable sight of one of these slave-sheds does not half represent the misery caused by this traffic—homes broken up, mothers separated from their babies, husbands from wives, and brothers from sisters. When last at Masankusu I saw a slave woman who had with her one child, whose starved little body she was clutching to her shrunken breast. I was attracted by her sad face, which betokened great suffering. I asked her the cause of it, and she told me in a low, sobbing voice the following tale:

“I was living with my husband and three children in an inland village, a few miles from here. My husband was a hunter. Ten days ago the Lufembé attacked our settlement; my husband defended himself, but was overpowered and speared to death with several of the other villagers. I was brought here with my three children, two of whom have already been purchased by the traders. I shall never see them any more. Perhaps they will kill them on the death of some chief, or perhaps kill them for food. My remaining child, you see, is ill, dying from starvation; they give us nothing to eat. I expect even this one will be taken from me to-day, as the chief, fearing lest it should die and become a total loss, has offered it for a very small price. As for myself,” said she, “they will sell me to one of the neighboring tribes, to toil in the plantations, and when I become old and unfit for work I shall be killed.”

There were certainly five hundred slaves exposed for sale in this one village alone. Large canoes were constantly arriving from down river, with merchandise of all kinds with which they purchased these slaves. A large trade is carried on between the Ubangi and Lulungu rivers. The people inhabiting the mouth of the Ubangi buy the Balolo slaves at Masankusu and the other markets. They then take them up the Ubangi River and exchange them with the natives there for ivory. These natives buy their slaves solely for food. Having purchased

slaves they feed them on ripe bananas, fish, and oil, and when they get them into good condition they kill them. Hundreds of the Balolo slaves are taken into the river and disposed of in this way each month. A great many other slaves are sold to the large villages on the Congo, to supply victims for the execution ceremonies.

Much life is lost in the capturing of slaves,

A LUFEMBÉ SLAVE-HUNTER.

and during their captivity many succumb to starvation. Of the remainder, numbers are sold to become victims to cannibalism and human sacrifice ceremonies. There are few indeed who are allowed to live and prosper.

CANNIBALISM.

CANNIBALISM exists among all the peoples on the Upper Congo east of 16° E. longitude,

and is prevalent to an even greater extent among the people inhabiting the banks of the numerous affluents. During a two-months' voyage on the Ubangi River I was constantly brought into contact with cannibalism. The natives there pride themselves upon the number of skulls they possess, denoting the number of victims they have been able to obtain. I saw one native hut, around which was built a raised platform of clay a foot wide, on which were placed rows of human skulls, forming a ghastly picture, but one of which the chief was very proud, as he signified by the admiring way he drew my attention to the sight. Bunches of twenty and thirty skulls were hung about in prominent positions in the village. I asked one young chief, who was certainly not more than twenty-five years old, how many men he had eaten in his village, and he answered me thirty. He was greatly astonished at the horror I expressed at his answer. In one village again, as I had bought a tusk of ivory, the natives thought perhaps I might buy skulls, and several armfuls were brought down to my boat within a few minutes.

I found trading somewhat difficult on this river, as the standard of value on the Ubangi was human life — human flesh. I have been asked on several occasions to barter a man for a tusk of ivory, and I remember that at one village the natives urged me to leave one of my boat's crew in exchange for a goat. "Meat for meat," they said. I was repeatedly invited, too, to help them fight some of the neighboring tribes. They said, "You can take the ivory, and we will take the meat"—meaning, of course, the human beings who might be killed in the fight. The more unfriendly of them would frequently threaten that they would eat us, and I have no doubt they would have done so had we not been strong enough to take care of ourselves.

During my first visit to the upper waters of the Malinga River cannibalism was brought to my notice in a ghastly manner. One night I heard a woman's piercing shriek, followed by a stifled, gurgling moan; then boisterous laughter, when all again became silent. In the morning I was horrified to see a native offering for sale to my men a piece of human flesh, the skin of which bore the tribal tattoo mark of the Balolo. I afterwards learned that the cry we had heard at night was from a female slave whose throat had been cut. I was absent from this village of Malinga for ten days. On my return I inquired if any further bloodshed had taken place, and was informed that five other women had been killed.

While in the Ruki River at the beginning of this year, I was furnished with another proof of the horrible fate of the slaves. At Esengé,

a village near which I stopped to cut wood for my steamer, I heard ominous beating of drums and outbreaks of excited mirth. I was informed by one of the natives from the village that an execution was taking place. To my inquiry whether they were in the habit of eating human flesh, he replied, "We eat the body entirely." I further asked what they did with the head. "Eat it," he replied; "but first we put it in the fire to singe the hair off."

There is a small river situated between the Ruki and the Lulungu, called the Ikelemba. At its mouth it is not more than 140 yards wide. Its waters are navigable for 140 miles, and it flows through the land of the Balolo. In proportion to its size it supplies more slaves than any other river. By looking on the map it will be seen that the Ikelemba, Ruki, and Lulungu run parallel to one another. The large slave-raiding tribes inhabit the land between these rivers, and bring their slaves to the nearest market, whether on the Ikelemba, Ruki, or Lulungu.

LOCAL SLAVE-MARKETS.

THERE are clearings at intervals all along the banks of the Ikelemba, where on certain days are held small local markets for the exchange of slaves. As one travels up stream small settlements are passed more and more frequently, and fifty miles from the mouth all the country on the left side of the river is thickly populated. It is noticeable that the villages are all on the left side of the river, the opposite side being infested by marauding and roving tribes who would raid any settlement made on their banks. All the slaves from this river are Balolo, a tribe which is easily recognizable by the exaggerated tattoo marked on the forehead, side of the temples, and chin.

During my ten-days' visit to this river I met dozens of canoes belonging to the country at the mouth of the Ruki River and the Bakuté district, whose owners had come up and bought slaves, and were returning with their purchases. When traveling from place to place on the river the slaves are, for convenience, relieved of the weight of the heavy shackles. The traders always carry, hanging from the sheaths of their knives, light handcuffs, formed of cord and cane.

The slave when purchased is packed on the floor of the canoe in a crouching posture with his hands bound in front of him by means of these handcuffs. During the voyage he is carefully guarded by the crew of standing paddlers; and when the canoe is tied to the bank at night the further precaution is taken of changing the position in which the hands are bound and pinioning them behind

his back, to prevent him from endeavoring to free himself by gnawing through the strands. To make any attempt at escape quite impossible, his wrist is bound to that of one of his sleeping masters, who would be aroused at his slightest movement.

In one canoe which I noticed particularly there were five traders, and their freight of miserable humanity consisted of thirteen emaciated Balolo slaves, men, women, and little children, all showing unmistakably by their sunken eyes and meager bodies the starvation and the cruelty to which they had been sub-

jected of their natures, and their peaceful, trusting disposition, that they easily fall a prey to the degraded and savage hordes in their district. They have artistic taste and mechanical ingenuity, and make exquisitely woven shields and curiously shaped and decorated spears and knives. They are exceedingly intelligent, faithful, and, when properly officered, brave.

IN THE FAR INTERIOR.

FOR many months I traveled on the Upper Congo and its affluents and had on several

Kerr. del. A. S. T. A.

A SLAVER'S CANOE.

jected. These slaves are taken down to the large villages at the mouth of the Ruki, where they are sold in exchange for ivory to the people in the Ruki or the Ubangi district, who buy them to supply some cannibal orgy. A few, however, are sold about the district, the men to be used as warriors, and the women as wives; but compared with the numbers who suffer from the persecution of the slave-raiders, few indeed ever live to attain a secure position of even the humblest kind in a village.

The wretched state of these Balolo has always saddened me, as intellectually they are a grade higher than the tribes surrounding them; and it is really owing to the gentler fiber

of their natures, and their peaceful, trusting disposition, that they easily fall a prey to the degraded and savage hordes in their district. They have artistic taste and mechanical ingenuity, and make exquisitely woven shields and curiously shaped and decorated spears and knives. They are exceedingly intelligent, faithful, and, when properly officered, brave.

As evidence of what can be done by gaining the confidence of the natives, through a policy of firmness and fairness, I think I may safely quote my experience at the Equator Station. I remained there for nearly a year,

SPEARS, SHIELD, AND ARROWS.

with only one Zanzibari soldier ; all the rest of my people were natives I had engaged from the neighboring villages. I was surrounded on all sides by powerful people, who, had they wished, could easily have overcome me and pillaged my post. But not the slightest act of hostility or of an unfriendly nature was ever attempted, and I felt just as secure among them as I do in the city of London or New York.

It is true the natives had nothing to gain by molesting me, and they were intelligent enough to perceive that fact. In reality, my presence was, to a great extent, beneficial to their interests. I had cloth, looking-glasses, spoons, cups, and trinkets, and these I exchanged with them ; every now and then I would organize a little hunt after elephants or hippopotami ; and as my part in the consumption of either of these animals was a very small one, most of the meat I gave away to the natives.

My life during my stay at the Equator Station

was a pleasant one. The people were of a happy and gay disposition ; all were friendly and talkative. They would sit for hours and listen most attentively to my tales of Europe, and their intelligent questions proved them to be possessed of keen understanding. There is no more attentive audience in the whole world than a group of African savages, if you can speak their language and make yourself understood. When I was tired of talking to them, I would ask them questions concerning their manners, customs, and traditions. As I was much impressed by their cruelty, I always made a point of expressing my abhorrence of it, and have even told them that one day I should strike a blow for the slave. My audience on such occasions consisted principally of slaves, and these poor wretches were always much gratified to hear my friendly opinions towards themselves. My arguments, I could see, often appealed strongly to the chiefs themselves, as I asked them : " Why do you kill these people ? Do you think they have no feeling because they are slaves ? How would you like to see your own child torn away from you and sold into slavery, to satisfy the cravings of cannibalism, or to be executed ? " They even said, some of them, at the time, that they would not hold any more executions. These executions did take place, but in a secret manner, and all news of them was kept from my ears until some time afterwards, when I learned of them from my own men. But I would have been unable to prevent the carrying out of such a ceremony with the force I had at my disposal in a single Zanzibari soldier !

SOME BARBAROUS CUSTOMS.

I REMEMBER one execution which took place, the details of which I learned afterwards. It was to celebrate the death of a chief who had been drowned while on a trading expedition. As soon as the news of his death was brought to the village, several of his slaves were tied hand and foot and lashed down into the bottom of a canoe. The canoe was then towed out to the middle of the river at night ; holes were bored in it, and it was allowed to sink with its human freight. When we are able to prohibit the terrible loss of life which the children of to-day are compelled constantly to witness, more humane feelings may develop themselves, and surrounded by healthy influences they will, unspoiled by at least open exhibitions of cruelty, grow into a far nobler generation.

Natives suffering at the hands of the slave-traders have repeatedly asked me to help them. At Malinga, where human flesh was offered me for sale, the assembled chiefs voted me

several tusks of ivory if I would live among them and defend them against the Lufembé, and enable them to resist the persecutions they were exposed to from the neighboring tribes, who were continually making raids into their districts, capturing their people. They said: "We are being starved to death. We can make no plantations, because when our women visit them they are caught, killed, and eaten by the crafty Lufembé, who are constantly prowling around and taking away any stragglers they may see." One old chief, Isekiaka, told me that already from time to time twelve of his women had been stolen from him, and several of his children. Indeed, so wretched is the condition of the people on the upper reaches of the Malinga that numbers of them have been driven by the Lufembé from their plantations on the mainland, and are actually compelled to live on the river in miserable huts, the floors of which are supported on piles. From these dwellings they suspend their nets, and as the river is full of fish, they subsist almost entirely on the produce of their hauls. This has given rise to a curious state of things; for, as the Lufembé grow only manioc, and have more roots than are sufficient for the tribe, they are only too glad to exchange these for fish caught by their victims. And so when a market is held an armed truce is declared, and Lufembé and Malinga mingle together and barter, with their products held in one hand and a drawn knife ready in the other.

It can be readily imagined that the incessant persecution which the natives are suffering renders them cruel and remorseless. Throughout the regions of the Malinga they become so brutalized by hunger that they eat their own dead, and the appearance of one of their villages always denotes abject misery and starvation. I have repeatedly seen young children eating the root of the banana tree, vainly endeavoring to obtain some kind of nourishment from its succulence. That they are able to exist at all is a mystery. Every living object they are able to obtain is accepted as food; different kinds of flies, caterpillars, and crickets are all eaten by these people.

When one has lived for some time in Central Africa, one comes to understand the little impression that acts of the most atrocious and wanton cruelty make on the savage mind. Surrounded from childhood by scenes of bloodshed and torture, their holidays and great ceremonies marked by massacres of slaves, the mildest and most sensitive nature becomes brutalized and callous; and if this is so with the free, what must be the effect upon the slave, torn when a child from its mother, perhaps at the age of two years, and even in its infancy compelled to suffer privation. If indeed

this child runs the gauntlet of cannibalism and execution ceremonies, it can hardly be expected that he will sympathize with any suffering.

The people on the lower part of the Upper Congo seldom practice slave-raiding. It is only when we come to the Bakuté district that we are brought much in contact with it. The large villages around Stanley Pool,—Chumbiri, Bolobo, Lukolela, Butunu, Ngombé, Busindi, Irebu,—Lake Mantumba, and the Ubangi River all rely principally upon the Balolo tribes for their slaves. All these villages except Stanley Pool are daily making human sacrifices, either in connection with the death of some chief or for some other ceremonial reason. Any kind of commerce transacted in this part of Africa only increases the bloodshed, because the native's ambition is to get as many slaves as possible around him; and when he sells a tusk of ivory or any other article he devotes nearly all of the cloth, brass wire, and beads which he obtains in exchange to the purchase of fresh slaves. So that he is surrounded by numerous women and warriors dur-

SPEARS AND "DEVIL DODGER."

TWO OF MY CREW.

ing his lifetime, and has his importance signalized at his death by the execution of about half the number of his people.

SUPPRESSION OF SLAVERY.

I FREQUENTLY talked with these people, and explained to them the iniquity of slavery; but they argued: "We have a great deal of hard work in our trading expeditions to obtain these slaves; why should we leave them all behind us for others who have not worked? We have bought them, they are our slaves, and we have a right to do what we like with them."

The ceremony of execution, with its attend-

ant brutality, ought to be, and can be, stopped. The bloodshed is even greater to-day than when Stanley first saw these people in 1877; the reason being, as I have before mentioned, that contact with white men has made them richer, and has enabled them to obtain more slaves. The great powers of the civilized world are now discussing the antislavery movement, and if such discussions should result in some united action directed towards the suppression of the trade in the interior, there are a few peculiar features which might be turned to advantage.

First, and most important, this traffic is not complicated by religious fanaticism of any kind.

Second. These people are disunited; every village of fifty or sixty houses is independent of its neighbor, and small family wars are continually taking place.

Third. There is nothing so convincing to the African savage as physical superiority.

Now all these points are in favor of the antislavery movement.

The absence of religious fanaticism, the disunited condition of the natives, and their acknowledgment of physical superiority ought to be taken advantage of, and always borne in mind when plans for the suppression of the slave-trade and its attendant barbarism are projected. In my opinion, it will be some years before the slave-trade carried on by the Arabs can be successfully grappled with, but there is no reason why any delay should occur in striking a blow at the intertribal trade.

The Congo Free State has moved a step in the right direction by establishing near Stanley Falls an intrenched camp, with

the object of forming a barrier to keep the Arabs, with their Manyema banditti, east of that position. Every country in the world should support the State to effect this object, as it will play a most important part in the history of Central Africa. When Stanley left Wadelai the Mahdists were already there. If these hordes join with those at Stanley Falls it will require most strenuous efforts to save the whole Congo Basin from their devastations. While we are still able to keep the Arabs east of the Falls, no time should be lost in eradicating the existing bloodshed west of that point. It is a big work, but it is a duty which the civilized world owes to

Remple-
39

the helpless slave. Although black, and a savage, still he is a human being. It should always be remembered that the suppression of slavery in Africa does not mean merely striking the fetters from the limbs of the slave; its end is not only the substitution of paid for forced labor, but also the relief of enslaved humanity throughout all these regions from a life of unspeakable horror, from tortures that only the savage African can invent, and from a certain and violent death.

From Banana Point to Stanley Pool slavery does exist, but of such a mild character that when operations are actually begun Stanley Pool should be the starting-point. If half a dozen fast boats were placed on the river at Stanley Pool, each armed with twenty black soldiers, officered by two or three Europeans who had proved by their past services that they were capable of dealing with the question, and if such a force had the recognition of the civilized powers and was allowed to strike a blow at the evil, thousands of human lives would be saved.

These boats would be continually moving about the river, and those in command would begin by making a careful study of local politics. They would have to convince the natives of their determination to stop these diabolical ceremonies of bloodshed. The natives should be warned that any villages which in the future were guilty of carrying out such ceremonies would be most severely punished. Some of the better-disposed native chiefs would have to be bought over to the side of the white man. Spies should be engaged all over the district, so that a boat on arriving would immediately hear of any execution that was about to take place or that had taken place; and I would suggest that any village which still continued these acts of cruelty, after having been fairly and fully warned, should be attacked, and a severe example made of the principal offenders. A few such punishments would soon have a most salutary effect. These operations I should recommend to be carried on between Stanley Pool and the Falls. Posts should also be established in commanding positions to control the mouths of the slave-raiding rivers. Each point should be supplied with a boat such as I have recommended for the lower river. Other stations should be established in the center of the slave-raiding district. Slaves at the time in the markets might be redeemed and placed in some settlement, where they could be trained as soldiers or learn some useful craft. I have, whenever it was possible, purchased the redemption of slaves, and on the completion of such purchase have always taken the precaution to place in the freed-man's hand a paper to the effect that he had

been redeemed by me from slavery, and that the expedition I represented would make a specified payment per month while he remained in its service.

EFFECT OF LIBERATION.

It was curious to observe the different effects that the announcement of such a redemption had on slaves freed so unexpectedly. As a rule, the bewildered man would go from one to another of my boat's crew, asking all sorts of questions as to the meaning of the ceremony. What was to be his fate? Was he to be exchanged for ivory? or was he to be eaten? And it would take some time and patience to explain to him, after his first surprise was over, the full import of the paper I had placed in his possession. Others, more intelligent, would immediately understand the good fortune that had befallen them; and it was strange to see the startling change in the expression of their countenances, which a moment before betokened nothing but unresisting acquiescence in their miserable destiny, and to note their inert and weary bodies, which seemed at once to become erect and vigorous when released from the degrading fetters.

After having bought all the slaves which were exposed for sale, warning should be given that any attempt to purchase human beings for slavery would be the signal for war, and that the purchasers would be severely punished.

The most important part of the movement is to convince the slaves of our earnestness and sincerity. I feel confident that should operations be carried on in the way thus suggested most satisfactory results would ensue.

The reason for the native villages being disunited is, that there seldom exists a chief strong enough to form a combination. This weakness should be taken advantage of, and capable white men might, through their personal influence, unite the tribes under their leadership. Sooner or later the Arabs at Stanley Falls will have to be battled with. At present they remain there, not because the white men will not allow them to come lower down, but because they are in the center of such a rich field, and they know that by coming down the river they must rely entirely on their canoes, as roads in the interior are few and far between, owing to the swampy nature of the land. They would also have the populous and warlike districts of Upoto, Mobeka, and Bangala to fight against, which would not be so easily overcome as the small scattered hamlets around Stanley Falls, which at present they are continually persecuting.

All the natives on the Upper Congo, quite up to the limits at present reached by the Arabs, should be controlled as much as possible by Europeans. They should be combined together under Europeans, so that when the time arrives that the Arabs decide to move west they would be met at their frontiers by a barrier of well-armed and resolute natives.

The slave-trade of to-day is almost entirely confined to Africa. The slaves are caught and disposed of in that continent, and the number of those who are shipped to Turkey and other parts are indeed few compared with the enormous traffic carried on in the interior. We have the authority of Stanley and Livingstone and other explorers concerning the iniquity existing in the eastern portion of Equatorial Africa.

COPPER ANKLET.

In India we have an example of what determination and resolution can accomplish; as the inhuman ceremonies of the suttee, car of Juggernaut, infanticide, and the secret society of the Thugs have all been suppressed by the British Government. The opportunities for reaching the center of Africa are yearly improving. Since Stanley first exposed to the world's gaze, in 1877, the blood-stained history of the Dark Continent, rapid strides have been made in opening up that country. The work for Africa's welfare so determinedly pursued by Livingstone has been most nobly carried on by Stanley, and the rapid progress which is at present taking place is due entirely to Stanley's efforts. A great obstacle has always existed between the outside world and Central Africa, in the stretch of unnavigable water between Matadi and Stanley Pool. The railway now being constructed will overcome this difficulty.

E. J. Glave.

THE HERR MAESTRO.

THE mistake was Maria's, not mine. Maria had but lately left Hungary for Venice, and, like me, was still learning Italian, but with this difference: she picked up hers from the one man-servant of the establishment—poor, much-scolled Giovanni with the curly hair and the rings twinkling in his ears, who helped her to make the beds; from unscrupulous gondoliers who, in the hall below and on the water-stairs without, wrangled with the travelers they brought to the *pension*; from the American artists who lived in the upper rooms and who talked a hybrid Venetian with a strong Western accent; in fact, from anybody and everybody who came and went in the Casa Kirsch. But I made less of my opportunities, and learned mine only from an old Italian master who arrived every day with admirable punctuality just as I knew the giants on the clock-tower in the Piazza were hammering three, and who was announced as regularly by a loud knock on my door and Maria's cry, "*The Herr Maestro, Signora!*" so that now it is by that name I always think of him.

Lena, Maria's sister, who knew her Venice well and English into the bargain, introduced me to him. She took me one morning along the Riva, where fishing-boats, kept at home

by gray and threatening skies, were moored in a long line, their brown nets hung up, their white woolly dogs on guard; past St. Mark's, the guides waiting for spring and its crop of tourists; under the arcades where early Venetians were already drinking coffee at Florian's; then by Bauer's, through an endless labyrinth of *calli*, up and down bridges, over dull canals, into a little sleeping *campo*. All the green blinds of the windows overlooking it were closed; no one was in sight; but when at a house if possible more deeply sunk in slumber than the others, she picked out one of the bells and pulled it; it raised a muffled jangling, and the door opened itself slightly and slowly in the mysterious Venetian fashion.

We pushed by it to a narrow dark passage on the first landing, but still no one appeared to ask our business. We called, but there was no answer. Somewhere, not far off, children were drearily chanting what sounded like the multiplication table, and that was the only sign or sound of life. It was so dark we could not see where to turn; but presently, just as we thought to go down and ring again, a servant came and showed us into a front room, where there was a bed in one corner, two chairs, and a table. It was forlornly poor and bare and cheerless. There was no need to open the closet-door to discover the family skeleton; it had established itself in the best room. The servant was quickly followed by her mistress, a tall, dark woman, middle-aged, with grayish

hair loosely twisted about her neck, and a hungry, calculating look on her thin, pale face.

Her husband was out, but he would return soon, Lena translated; the Signora must wait, and she gave me a chair. There was quite a new light in her eyes when Lena spoke of my proposed lessons.

And then the children's voices stopped in the distance, and a younger woman—the daughter of the other. I soon found out—

ALONG THE RIVA.

joined us. There was the same eager look in her equally thin, pale face, the same light in her eyes, when she heard the reason for my visit. The room was very gloomy with its drawn blinds on this dull morning, and though I am not sure I really looked to see what mother and daughter wore, it seemed to me their clothes were as gray and colorless as I felt their lives must be.

I had just succeeded in explaining that I was not *Inglese* but *Americana*, an explanation one makes to one's advantage in Italy, when the *Herr Maestro* arrived. He was an elderly man, about sixty-five perhaps, short and thin, and stooping a little from the shoulders. His

gray hair was carefully brushed to hide his baldness, there was a touch of color in his clean-shaven cheeks, and a gray mustache hid his mouth. He wore a long brown overcoat, fastened its entire length, and trimmed at the neck and wrists with broad bands of black astrakhan. Later, in the pitiless sunshine that streamed from across the lagoon into the pension windows, I could see that this coat was elaborately darned about the pockets and the buttonholes, that the astrakhan was worn and in places threadbare, and that the great old-fashioned brown cravat holding up his high standing collar was faded and soiled. But in

the dim twilight of his own room these details were lost, and as he came in, a high silk hat in his hand, a cane jauntily held under his arm, he had quite the air of a man about town.

He greeted me with gracious, old-fashioned courtesy, and his bow went far to counterbalance the shabbiness of his surroundings. He spoke

looked relieved, for they knew every time I saw him would put a few francs into his poor, patched pockets.

That very afternoon our lessons began, and they continued for many months with the regularity that was so greatly to the credit of the Herr Maestro. It was still early in the season,

"WILL MADAME HAVE THE GOODNESS TO RECITE THE VERB?"

a fairly fluent French, and in it he placed himself unreservedly at my service. In all our arrangements about lessons my pleasure seemed to be his one consideration. When it came to the question of his charge for a daily lesson of an hour, I fancied I detected a little eagerness in his manner, but it was gone in a moment. Madame must suit her own interests and convenience in all these matters, he declared. He might have been a friend volunteering to guide me through the channels of the lagoons, rather than a master engaged to pilot me through the intricacies of the Italian grammar. He could not come at the hour I named, because he was then in attendance on the daughters of a countess, and somehow he made it seem as if his coming to me from such very distinguished patrons was an additional favor.

And yet all the time his wife and daughter, neither of whom spoke French, kept looking from my face to his with their pathetic, hungry eyes, as if their very life depended on my decision. They seemed to understand that the *a rivederci*, which I ventured upon in hopes it was the proper thing to say, meant that I expected to see the Maestro again; and they

and there were so few people in the pension that we usually had the lesson in the parlor, where it was pleasant in the afternoons with the sun shining in at the windows. From the table where I sat I could see a great stretch of blue lagoon, and crossing it now a tawny red or orange sail, now a long black gondola. I remember I used to think it not the least of the Herr Maestro's virtues that he could keep me awake at this hour, when nearly everybody was napping in Venice. The tap, tap of the slippers over the bridge just below ceased for a while; the gondoliers' cries were stilled; and I knew that many were sleeping in their gondolas, and that all along the Riva men were stretched full length, dreaming in the sun. But when the lesson was almost at an end, from over the water would come the bugle of the soldiers on the homeward way from daily drill in the Lido, followed by the noise of their disembarking and marching, and the sleepers awake; and under the window again rose the familiar cries and clamor without which nothing is done in Venice.

Only once the Herr Maestro failed me, and that was on a day when the rain was falling in

torrents, and the angry wind was sweeping the deserted Riva and the gray lagoon, and it seemed as if the deluge had come. All the fishing-boats were at home, lining the Riva, and the little canal by our house, and pulled up under the bridge. By evening it was so wet that, instead of going, as was our custom, with Inglehart,¹ the artist from upstairs, for dinner to the Antica Panada, and for paper and coffee to the Café Oriental, we had our supper in the big kitchen of the pension, while the family ate theirs at another table, the cook at still another, and poor Francesco stood in one corner with his plate on the dresser. It was no wonder the Herr Maestro staid in his dreary rooms when even the fishermen and their dogs found it too wet to venture out of their little canvas cabins.

When I saw how shabby the Maestro was, for all his brave assumption of elegance, and I remembered the hungry faces at home, I asked him when he would prefer my paying for my lessons. He had shown such indifference about this part of our bargain at first that I felt a delicacy about bringing him the money and saying, "Here is in advance for the first week," as I should have done. He dismissed the subject with a fine, large wave of the right hand. Madame must not trouble about such trifles; at the end of the first week, if Madame chose; or of the first month, that would be better still; or just as Madame was leaving. Ah! that indeed would be best of all. "And now will Madame do me the favor to recite the verb 'to have'?"

After this it was not easy to return to the subject, and during one week, while I struggled with verbs, we never mentioned it. But at the end of that time, on a Saturday it was, just before he came, the Padrona knocked at my door. She hoped the Signora would pardon her, but yesterday the Maestro had borrowed of her ten francs, promising to pay with the money from the lessons. And so would the Signora kindly say when she paid the Maestro?—the Padrona would then know when the little matter could be settled. This made me less fearful of offending the Maestro's dignity, and at once upon his arrival I explained that on consideration I decided it would be best to pay at the end of every week, and I handed him the first instalment.

"As Madame wishes," he said, with an expressive shrug, as he pocketed the money.

Had he realized how much I was going to learn from him, he would have felt justified in making an extra charge. At first I let him have his own way, knowing it would help me

to have mine when the time came. He had pronounced theories about teaching, and, with due deference to his position as master, I consented to cover sheet after sheet of paper with verbs passive and active, verbs regular and irregular, and to conjugate them aloud.

"And Madame, she is quite well?" was always the beginning of the lesson. Then would come out his snuff-box. "And now will Madame have the goodness to recite the verb she wrote yesterday?"

"I have," or "I am," or "I love," I would begin, while he nodded, and tapped his satisfaction on his snuff-box. Not until the last person of the last tense, however, would he open it and reward himself with a well-earned pinch.

"Ach! but Madame's memory, it is marvelous! and Madame's progress!"

It was pleasant to listen to his praises, and in Venice, where it is difficult to force one's self to great effort, the verbs were soothing. But the second week I brought to my lesson the books I wished, for certain reasons of my own, to translate. It was nonsense, the Herr Maestro said, to try to read for many weeks to come. Madame was a credit to him as a pupil, but Madame herself would doubtless admit she had still much to learn. And again, these little books were all in the Venetian dialect, and none but the vulgar would speak Venetian. When he saw, however, that I was determined, "As Madame wishes," he said, and without further delay we fell to work.

The books in question were volumes of Bernoni's admirable collection of fairy tales, songs, and legends. They seemed childish to the Maestro; my desire to read them to him was but another folly of the *forestieri*. But it was funny to see how interested he became despite himself. He began to enjoy the hour with them so much that often he staid ten or fifteen minutes after his time to finish one story or to read another. Some days, indeed, it was half-past four, or nearer five, when he bowed low at the door and gave me the never-failing "Allow me to salute you, Madame." And then, too, he found that, though I could not speak, I could understand, Italian, and, unconsciously almost, he dropped his French. The stories and songs, foolish as they were, constantly reminded him of strange things he had heard, strange things that had happened to him. As often as not the afternoon reading became an afternoon talk. And now it was amusing to hear the Maestro in his excitement speaking pure Venetian—the Venetian that belonged to the vulgar. The soft *ghe ze* was as often in his mouth as in that of a gon-

¹ This is not meant for plagiarism; I know whom Mr. Howells meant by Inglehart, and I mean the same man.

dolier, or as in the mouths of the girls chattering about the wells in the little *campi*.

It was in the course of these talks the Maestro taught me so many things he had not agreed to teach. In the first place, he told me much about himself. He was not a Venetian, but an Austrian. He had, however, as a boy loved Italian, and that at a time when to study or to speak it was a criminal offense in his country. He was, when quite young, a schoolmaster, but once it was discovered he was secretly studying the hated language, he was banished. He came immediately to Venice, where he had married and had lived ever since. "One could live in the old days, Signora. There was money to be made. But now it is different. It is almost impossible to find the bread to put in one's mouth. My daughter has a school for children, but, body of Bacchus! what does she make? Sixty or sixty-five francs a month, barely enough to pay the rent. The little money I make, it goes to pay a debt. My one son has a misery in his head; it is years since he could work. My other son is a schoolmaster in Cioza. It is a good position: he makes 3000 francs a year; but he has no economy, and his wife is a good-for-nothing."

This was the first time he had ever hinted at his poverty. When he rose to go home he hesitated a minute, and then: "Will the Signora pardon me if I ask a favor? Could the Signora perhaps kindly pay me for a week in advance? It would be a very great convenience."

It was Friday afternoon, just a week since he had borrowed money from the Padrona. I do not know why, but it suddenly struck me that it is on Saturday the lottery is drawn.

Another day we spoke of religion. The Herr Maestro had very positive opinions. Monks and priests and churches were nothing to him, but, soul of a pig! he believed in God and in future rewards and punishments. It was a fine sermon the cardinal had preached on Easter Sunday in St. Mark's. It was a pity the Signora did not hear it. Body of Bacchus! It was logical and learned. A people governed without religion, the cardinal declared, never prospered, and the government must look to the future, when they would have to regret their present system of secular education. "It is true, Signora,"—and here he lowered his voice and looked cautiously around the room,— "and there are other things the government will have to regret!" And it seemed that under the threadbare coat of the modest Herr Maestro there beat the heart of a patriot. He was a red republican; and, the ice broken, he had no further hesitation in confiding his republicanism to me. But he was very careful. There was always the same lowering of his

voice, the same look around the room; and if, by any chance, some one came in, he would stop abruptly and return to Bernoni.

What treason we used to talk in the sunlight! It is all very well for rich people, this present government, he used to say, but it is terribly hard for the poor. Here in Venice the millionaires, they make more money; the poor, they starve. If the people did not love the queen so they would think the Piedmontese worse than the Austrian. It was from the Maestro I first heard of the widespread discontent throughout Italy, now breaking out in conspiracies led by army officers, now in the rebellion of students. It was from him I first heard of the wretchedness of the peasants of Lombardy. They are paid twenty or thirty centimes a day, perhaps, for working in the fields; they can afford to eat nothing but polenta, and bad polenta at that; they cannot buy wine, but must drink the polluted water that runs by their miserable huts. And what was the result, would the Signora know? They go mad, and are shut up—yes, shut up by hundreds—in the island of San Lazzaro. And when the Signora goes by, she can hear the yells of these poor mad creatures, these human beings like ourselves, Signora, but starved into madness!

I remember the afternoon he told me the story of this wretchedness—a story I have since learned to be but too true. The spring was yet young in Venice, and through the open window came in the soft sea air blown from the Adriatic over this very island of San Lazzaro, rising, a fair spot in the lagoon, for the greater pleasure of the tourist. The Maestro would not let me forget that even the sunshine of Venice has its dark shadows.

I confess I grew very fond of this patriotic, tender-hearted Herr Maestro, whom I strongly suspected of being half starved himself. But no poverty could subdue the love of freedom that of old had set him to the study of Italian in a land where this study was a state offense. He made such a brave fight, too, against his troubles. I used to watch him sometimes when, our lesson over, he sauntered down the Riva towards the public gardens, his cane under his arm, his hands in his pockets, with all the jauntiness of a Venetian Beau Nash. And with me his manners never lost their princely elegance, their gentle courtesy, notwithstanding the habit into which he speedily fell of borrowing money on Fridays.

For before long the question was, not whether I should offer him money for my lessons, but whether I should refuse to lend him all he asked for. That fine, large wave of the hand that seemed so impressive meant nothing after all. As soon as he had asked for money the first

time, he found no further difficulty. The next Friday it was for two weeks in advance he begged the Signora would oblige him, and the next Friday it was for a month in advance. Then he began to borrow ten francs, twenty, thirty at a time, and always on Fridays. Now in Italy, the worst of it, where money is concerned, is that you are always suspecting the people of trying to cheat you. They are not dishonest, but they have their own way of doing business, and they think the forestieri come to their country for no other reason than to be fleeced. Two or three little remarks of the Maestro made me believe he shared this general impression. He told me wonderful tales of rich *Inglese* walking along the Riva and dropping gold pieces into the extended hands of chance beggars. And so, when he himself took to borrowing from me, I was careful to explain that I was really not any better off than he—that I, too, worked for my living. Then, when he gave no sign of giving up this bad borrowing habit, I made a feint of consulting J—. “I must go and ask my husband,” I would say, as I left him to go upstairs.

“Don’t you think perhaps he’s only another fraud?” I would ask J—, with exemplary caution.

“I’m sure of it,” J— would answer; “but, poor old fellow, he’s so old! Any way, give it to him just this once.”

And so our lessons went on until the time came for me to leave Venice. On my last Friday I was sitting in my room, when, about eleven in the morning, there was a timid knock at the door.

“*Avanti*,” said I, for I had profited by my studies.

The door opened, and in came the Herr Maestro. Never before had he announced himself so unceremoniously; never before had he arrived before three, the appointed hour.

He was so grieved to come early, but very important business would occupy him in the afternoon. Would I, perhaps, for this once, take my lesson in the morning?

I was not very busy, so I put up what I was at, and got out my Bernoni. We began without delay to read some Chioggian songs. I noticed the Maestro was not very attentive. He did not correct me once; he did not help me in my translation from the Chioggian into French. Presently he shut the book. “Signora,” he said, “I must speak. I am in so great trouble.” And he turned to me with tears in his eyes.

“What is it?” I asked, for it was sad to see my poor, brave Maestro give up at last.

“Oh, it is money!” he answered; “that awful debt—three thousand francs! If I do not pay it, Signora, I shall be lost. My family will be turned out upon the streets.”

Now for me to give him, then and there, three thousand francs was an impossibility, even had I felt inclined to do so. I thought it the truest charity to tell him this at once. “Why not go to your son in Chioggia?” I suggested.

He took out his old blue handkerchief and wiped his eyes. “Signora,” he said, “I am so tired of my life. I am so old, I often wish I could die. It would be a happiness if death would come to-day!”

It was pitiful to see him in his trouble, and yet in the midst of my pity I could not stifle a certain doubt of which, truth to say, I was ashamed.

“I dare not go home if I have nothing to take with me,” he went on. “I know it is too much to ask the Signora to relieve me of all my troubles, but five or ten francs, some little sum, perhaps she would give me. Even that would be something.”

“I must ask my husband first,” I said, trying to steel myself. “He will be home soon.”

“But the Signor will be angry perhaps?” he urged.

I knew too well I could assure him he had nothing to fear on this score, and we went on with the songs, his poor hand trembling as he turned the pages, his voice breaking as he talked.

Presently J— came in. I at once told him the Maestro’s story. As the latter did not understand a word of English, we could speak freely.

“What do you think?” said I, as I finished. “Do you suppose it’s all true?”

“The lottery’s drawn to-day, and there’s to be *tombola* in the square on Sunday,” he answered, saying exactly what was in my mind. It certainly was a strange fact that it was always at the end of the week the Maestro’s debt was so pressing.

“Of course it would be more sensible not to give him anything until we asked the Padrona about him,” I said.

“Of course it would,” said J—.

“It’s hard to refuse, is n’t it?” I added.

“Yes,” agreed J—; “and he’s so old. If he does lose it right off, no great harm’s done.” And he got out his purse.

Well, we gave him a few francs; few enough if the old man really was borne down with the burden that made death seem a great good to him, more than enough if they were to be played away on unsuccessful numbers.

He got up without a word, the poor Herr Maestro, but tears were in his eyes and on his cheeks. He went over to J—, took his hand and kissed it, then came to me and kissed mine. Still silent, he turned and went out of the room.

It is not pleasant to have your hand kissed by a man whose hair is gray, and whose shoulders are bent, and for whom you have done nothing. We went out on the little balcony, and looked after him as he walked up the Riva in the sunshine. All his jauntiness had come back again; his hands were in his pockets, his cane under his arm. Was he going to the wife whom he could now more easily face, or to the familiar little shabby office with the numbers upon the wall?

The next day, Saturday, J—— and I and Inglehart, and one or two others, made a long-talked-about journey to Chioggia, and there was no lesson. Sunday was always a holiday for the Herr Maestro and his pupils.

It was early Sunday afternoon when we began to hear the tap, tap of many slippers over the bridge, and gay voices, and much laughter; and when we went out we found all the pretty girls with their faces turned towards St. Mark's. Five and six in a row, they were walking arm-in-arm with no heavy water-buckets to carry. Their long hair, if possible more elaborately braided than usual, and wound round and round their heads, was unhidden by bonnet or handkerchief, and their bright shawls were draped gracefully about them. The Apollo-like loafers, with their coats thrown over one shoulder, their big hats over the opposite ear, and their thick curls and twinkling earrings, were magnificently moving in the same direction. A certain number of foreigners were abroad in the land. All the fruit-stalls, with their golden piles of oranges, were reaping a copper harvest. Here a crowd had gathered about the toothless, blindfolded seer, who all that spring was prophesying about Naples and the cholera, so that her "Una volta soltanta perre Napoli" came to be yelled by the small boys before she could prophesy it herself; and there soldiers and gondoliers and groups of women were watching a family of acrobats. But the gaiety was at its height in the square. A band was playing at the end near the Piazzetta; the

tombola-stand was set up in the center; in front of the Quadri and Florian's tables and chairs had been brought out, and half of Venice seemed to be drinking coffee and eating ices. Those who could not find or afford tables were walking up and down, and as the crowd grew larger and larger, people kept falling into the ranks, until a regular procession was formed, its two detachments coming and going with an order and regularity the little blue-coated soldiers might have done well to emulate in their daily march up the Riva.

Before the afternoon was over, by good chance we secured a table; and there, over a cup of coffee, we listened to the music and watched the people. What a row they all made, from the *Barabow-wow* — as we only knew it — of the Venetian newsboy and the *candeti! caramei!* cries, to the *thinguethkeithkatola* (this is phonetic spelling) of the match-boys and the "Lo Times! Lo Standard, L'ultima edizione del Nei gark Her-r-r-ald, Signore!" of the superior newsvender. It was now almost time for the tombola to be drawn, and on every side men and women were holding little bits of paper in their hands, and others selling these papers passed, making bargains as they went. Once and again in the procession we saw the Herr Maestro, jauntier than ever, his wife on one arm, his daughter on the other.

At last the music stopped; everybody pressed around the tombola-stand; there was a silence unbroken, save now and then, when, as the numbers were shown, there was a great shout, and the lucky holders rushed up the steps, flourishing their papers. But the Maestro was not among them.

Was he in the square simply because relief from his most pressing needs made a holiday possible to him? or had he staked his little all and lost?

We were to leave Venice on Tuesday; my last lesson was for Monday. He never came. I never knew.

Elizabeth Robins Pennell.

SUGGESTIONS FOR THE NEXT WORLD'S FAIR.

BY THE DIRECTOR-GENERAL OF THE PARIS EXHIBITION.

THE Paris Universal Exhibition of 1889 has just scored a success so brilliant and so immense that the question must needs be asked whether it would be wholly prudent, apart from any consideration of utility, to attempt to repeat, anywhere, before the lapse of a long interval, an international enterprise of this nature. Many years must pass before the ineffaceable souvenir of what has just been accomplished can become dimmed; and there is reason to fear that the sumptuous and unexampled setting of the celebration of 1889 would in itself be an obstacle to the success of any other exhibition that it might be sought to organize sooner than the beginning of the coming century. No country of Europe, at least, displays any disposition to try the experiment.

But here we have the United States of America apparently resolved to set at once at defiance and at rest the doubt which I have expressed as to the fate of any exhibition which might be decided upon in the near future. Discussion is warm as to a universal and international exhibition to be opened in 1892 either at New York or at Chicago. I acknowledge that the Americans are the only people who could find justification for making an attempt so audacious, for the position of America is exceptional.

The Americans are a youthful people; they possess neither an art of their own nor a history. Yet they have won for themselves a rank and an influence so great that every one of us desires to learn to know them better, despite the ocean and distance. Already I hear numbers of my compatriots express their intention to cross the Atlantic upon the occasion of the exhibition in the United States—a journey to which their business affairs and their normal humor for traveling would never have persuaded them. And what people are saying in France they will soon be saying everywhere.

The first piece of advice that I take the liberty of giving to the organizers of the exhibition of 1892 is, that they shall aim at novelty and at the extraordinary, but without neglecting due order and method. They will thus keep themselves in accord with the characteristics of their nation, which is a new one in the company of civilized nations—a nation which is extraordinary in the development, so swift

as to make the brain reel, which it has succeeded in giving to its economic and social progress; a nation which proves that it possesses a practical spirit by the implacable logic of its conceptions and its acts.

Exhibitions, as they were conceived forty years ago by those great thinkers and great utilitarians, Michel Chevalier, Prince Albert, Cobden, Henry Cole, and Le Play, had as their object the bringing together of men and of things, whereby it was held that they would reveal the chief industrial and scientific gains made throughout the world, and would enable men of action and friends of progress everywhere to understand one another better than mere correspondence or the reciprocal notoriety of their achievements could render possible. At that time the great avenues of communication by rail and by steam navigation were not yet open under such conditions of speed and of cheapness as we enjoy to-day; the philosophic programme of these creators and organizers of the first great universal exhibitions had thus an immediate and direct application.

Little by little, and in proportion to the gradual obliteration of distance, the true character of such exhibitions became modified; they no longer abounded in revelations; it became their object to supply an effective, a palpable, an eclectic compendium of all the manipulations recognized as truly useful and in the spirit of progress which had been accomplished, whether in the domain of the arts or in that of pure or applied science, during the interval between two exhibitions. These gatherings nevertheless continued to compose their chief display of the implements and materials used in the practice and support of the industries of the world, arranged in classes of objects of similar nature or complementary to one another.

DISPLAYS OF IDEAS.

It became necessary to do more than this, and to give to the exhibition a form less baldly material. From this on, it was no longer deemed enough to heap together masses of people and things; it became the aim to realize what I have termed *displays of ideas*. The primary conception of such an organization of exhibitions, more absolutely complete than the old, came to me at the time when I was intrusted, in 1881, with the direction of the International Electrical Exhibition, held in the Palace of the Champs Élysées. It occurred to me that an exhibition

of this nature could not attain fully the ends sought if it were so restricted as to appeal only to the eyes of the public—that is, if it were merely to display *results* to visitors in general still ignorant of this newest branch of physical science, without giving them the means of appreciating at least some of the causes and of the researches which had brought these results into being. Actuated by this reasoning, I induced the government to call together an International Congress of Electricians, for whom the exhibition became a masterful laboratory; and the crowds of visitors to the exhibition manifested a redoubled interest in the apparatus and the experiments displayed, when these were explained to them through the published accounts of the sittings of the Congress, with all the prestige attending the foremost electrical authorities of the world.

I had the good fortune to secure the adoption of an analogous method in the organization of the Exhibition of 1889. To consider this organization on the material side, I had, in a pamphlet published in 1885, demonstrated that what I styled a *disseminated* or *scattered arrangement* should be substituted for the former compact arrangement—that is, that it was best to form as many independent aggregations, separate one from the other, as there should be distinct groups in whatever system of general classification of exhibits should be adopted. I perceived that in this way there would be secured not only greater facility of circulation for the visitors and convenience in the examination of the exhibits, and this with enhanced picturesqueness and monumental variety, but also a subdivision of the vast exhibition of products, as a whole, into veritable laboratories, distinct from one another and corresponding to the most characteristic branches of industry and commerce. These laboratories would be fitted to supply economic and scientific data to the international congresses which it was my intention to organize, and which I actually succeeded in instituting; and the reports of the sittings of these congresses will contribute to the immortalization of the ideal side of the exhibition which has just closed in Paris. The congresses were in every way successful, because their programmes had been carefully studied and drawn up in advance by committees of specialists appointed for the purpose. With the object of giving still further encouragement to the expression and interchange of thought, I supplemented the group of congresses by the arrangement of courses of lectures, which afforded to the speakers invited an opportunity to treat their subjects in such detail and

under such form as they judged best. I most earnestly advise the commissioners of the exhibition of 1892 not to separate in their preliminary labors the preparation of the material side of their work from that of its economic and ideal conception. I suggest that they secure at once the coöperation of some person of mark to hold the office of secretary-general of the congresses and lecture-courses, with a seat in the council of organization of the exhibition.

The directors of the exhibition of 1889 did not rest satisfied with having arranged side by side with their exhibition of things the exhibition of ideas which had its being in the congresses and the lectures. They sought further to show, by the agency of data, of documents, of striking object-lessons, what is being done everywhere and by all peoples to better the lot of man. It was essential to demonstrate how the advance of moral and physical hygiene must contribute to guide the destiny of the laboring-classes into smoother channels, and to guarantee to them an easier life and a comfortable old age; to show how the community, quite apart from charity, can, by social measures intelligently ordered, attain to mutual assistance and to the most assured provision for the future. To this end we provided a section of social economy, of which the success surpassed all expectation. In this section the United States of America took an important and conspicuous place.

CLASSIFICATION.

THE general plan of an exhibition depends, as follows from what I have said, upon the system of general classification adopted. This classification has to deal, first of all, with the productions of the fine arts, of manufactures and other industries, of the farmer, and with alimentary supplies. A second and independent classification should include the sections of the retrospective arts, of social economy, and the organization of congresses and lectures.

I judge that the system of general classification of products which was followed in 1878 and 1889, after having been first put into execution in 1867, must be considered for the future as the necessary code of any well-arranged exhibition. This system is conceived in accordance with the most invulnerable logic and the most natural synthesis. Three groups, food, clothing, and habitation, with their respective accessories, are devoted to the products which supply the primordial and inevitable needs of man; three groups subordinate to these have to do with research as to the nature, with the theoretic elaboration, and finally with the industrial supply, of these prod-

ucts. Industry is provided for: first, by the group of raw materials, with the industries of extraction concerned with them; secondly, by the group of liberal arts, that is, of the material and processes of intellectual work; and thirdly, by the group of machinery and mechanics in general. In addition to these the group of agriculture, including horticulture, and the group of the fine arts, complete the number of eight essential main divisions. These main divisions are then subdivided into classes, of which the number and the denominations can have sufficient elasticity to take in all the rubrics of the practice of the arts and trades, of agriculture, of commerce, and of the arts of design.

It is self-evident that the march of time is unceasing and productive of uncertain effects, and that this forbids us to look upon any human conception as immutable. Nevertheless, the fundamental lines of a system elaborated in accordance with the natural order of things may be considered as permanent as the laws of nature themselves. I judge, therefore, that it would be a grave error to abandon or to alter the main divisions of the classification which I have just explained, although I concede that this classification can be rigidly carried out only on paper and for the purposes of cataloguing the exhibits. I recognize, nevertheless, that modifications or perhaps simplifications may be made in the subdivision of the classes; some may to advantage be consolidated with others. For instance, the class of painted and stamped yarns and tissues might well be abolished, so that the several classes established, every one for a distinct variety of yarn or of fabric according to the material,—flax, wool, cotton, or silk,—should include every one all that has to do with its particular variety of yarn or of fabric. The class of agricultural machinery, again, might be removed from the main group of machinery and placed under the group of agriculture. But the American commissioners of 1892 will be thoroughly competent so to remodel the plan which I have roughly sketched that it may provide such secondary subdivisions as will correspond most perfectly to the genius and the habits of their people.

As we have said, it was our object in Paris to scatter, even to separate as completely as possible from one another, the various buildings, differing in size and in architecture, which, as convenience dictated, were appropriated to as many groups of products. In order to put such a plan into execution it is necessary to have at hand a sufficient area of unencumbered ground. The Champ de Mars, the Esplanade of the Invalides, the Park of the Trocadéro, the Quai d'Orsay, and the embankments of the Seine, together furnished

us an area of about 900,000 square meters, of which about a third, or 300,000 square meters, was taken up by the chief buildings of the exhibition. It is my opinion that the coming exhibition in the United States should dispose of an area still more considerable, so far as possible in one piece, and of regular form. It would not be necessary to roof in more than 300,000 or 350,000 square meters; but it is important to have open spaces of sufficient extent to permit the laying out of parks and gardens on a liberal scale. These provide for agreeable repose, with the possibility of walking in the open air, amid the beauties prepared by the gardener's art and fine effects of verdure, all of which will be appreciated by the visitor who is affected by the lassitude of mind and body which must necessarily result from his passage through the buildings and galleries of the exhibition.

BUILDINGS.

It is to be desired that at once upon entering the inclosure of the exhibition, by a monumental gateway, the visitor should have before him a prospect of the exhibition as a whole, such as lay before our guests in 1889, while traversing the Pont d'Iéna, or in their descent of the slope of the Trocadéro. The fine arts and machinery buildings could appropriately balance each other on the right and on the left—the one devoted to the most lofty expression of the conception of the ideal, the other to the most highly developed realization of the practical genius of man. The visitor would thus be dominated, at the moment he entered the inclosure, by the sentiment of the splendor to which can equally attain the application on the one hand of the esthetic principle, and on the other of the mathematical principle—those two great principles between which has always oscillated the glory of nations.

Two other buildings should in like manner form pendants one to the other—that devoted to industrial products and that for agricultural products; and in relation to both these could appropriately be placed the department of alimentary products. Agriculture is the great mother of all things; its fruits nourish the world. Industry, on the other hand, perfects, ameliorates, and disseminates the artificial conditions of that life of which agriculture maintains the vitality. It would be in the spirit of a wise and instructive philosophy to set thus face to face nature aided by man as he is impelled by his primary needs, and nature caused to promote the requirements of industrial production by the same man, who by the aid of science penetrates her secrets, and undertakes to obtain from her, whether she will or no, the

conditions necessary for an easy, comfortable, and brilliant life, such as the simple products of the earth could not of themselves give him. In the midst of these four or five chief buildings should rise the pavilion of liberal arts—the temple of intellectual activity which dominates all, the fine arts as well as the industrial arts. Intellectual work, or, to give it a simpler name, study, is at the foundation of all progress; the apparatus which it has evolved for itself promotes and facilitates the numberless applications of science in all their forms, useful or agreeable, modest or imposing. It is in study that the modern world has its being; to study belongs the place of honor.

As to the styles of architecture to be adopted for these various buildings,—palaces, galleries, and pavilions, as we in France should style them,—I have no counsel to offer. The American commissioners of 1892 do not need to be told that the fundamental law of architecture is that the conception of the lines, proportions, forms, construction, and decoration of any edifice ought to be such that it shall as a whole correspond to and reveal its purpose. It is because of this fundamental law that never yet has success been attained in the attempt to house a universal exhibition in a single building and at the same time to make this building architecturally good. It is needful that the various buildings requisite for the exhibition of 1892 shall be themselves exhibits, displaying at once the art, the science, and the inventive genius of the architects and engineers of America. In working out the plans, all harassing thoughts of the economy which might be realized by making merely temporary buildings must be put aside. The architect must forget that the exhibition is to be a festival of limited duration; otherwise, he will build nothing intellectually satisfying, and will fall short of the beauty which every type of edifice ought to possess; and, in fine, he will lessen greatly the chance of making afterward remunerative sales of the building materials or of organic parts of his structures.

I will not enter upon the organization of the accessories of the exhibition of 1892, such as places of amusement, the refreshment service, and divers other public services. Everything will depend upon the scheme adopted for the chief divisions of the enterprise. The exhibition must be full of gaiety and liveliness, yet it must avoid anything that might impress upon it a trivial character—anything that savors of the circus or variety-show. This danger is to be overcome by exercise of administrative firmness and judgment in the allotment of privileges or licenses. It is essential to seek out among such attractions as may be admissible without compromising the dig-

nity of the administration and of the American people such as shall have, so far as possible, the quality of absolute novelty, even, if it may be, to the extent of approaching the marvelous. In the realization of this programme it may be expected that electricity will play a conspicuous part. But under this head I have nothing to teach to the people among whose citizens are enrolled the illustrious names of Edison and Elihu Thomson.

CATALOGUE.

THERE are two matters which should have the particular attention of the American commissioners of 1892—the catalogue, and the recompenses to be offered. A good general catalogue is absolutely necessary: it must be complete or its usefulness will be impaired, and in like manner it must be absolutely correct and exact; it must be portable and convenient to use with reference to the number, shape, and size of its volumes. From this it is plain that the question of the catalogue has always been and probably always will be, to the administrators of a great exhibition, one of troublesome difficulty and responsibility. There is but one way to succeed in getting together the subject-matter for such a catalogue within the proper time—that is, in season for the catalogue to be ready on the very day of the opening of the exhibition. This way consists in requiring artists and other possible exhibitors to give early notice of their intention whether to take part in the exhibition or to remain aloof; and upon the allotment of space to intending exhibitors, they must be required to send in a detailed list of their exhibits a full year before the opening. In order to constrain them to respect this time limit, which, everything considered, is to their own advantage, it is necessary to enforce a penalty in the event of infringement; and this penalty can be applied best in the making of a moderate charge per line for all insertions in the catalogue, which charge should be doubled, tripled, quadrupled, quintupled, sextupled, according to the number of months of delay. Beyond six months after the time, no further entry for the catalogue should be accepted. Every exhibitor should be permitted to dispose, at the rate fixed, of two lines for his name and address, and of a maximum of ten lines for a summary description of his exhibits in the respective classes in which they belong. I suggest as the normal rate per line, forty cents, or two francs. The American commission would be immediately responsible only for that part of the general catalogue having to do with the sections of its own nation. Every country taking part in the exhibition

would be called upon to prepare its own portion of the general catalogue, and to print it in English in the same size and type adopted for the American catalogue. The collection of all these national catalogues, all printed in English, and in the same size and style, would constitute the general catalogue. Every country would be at liberty to publish separately a special catalogue in its native tongue, and to offer it for sale at its own risk, as well as the volumes of the general catalogue having to do with its own sections. This arrangement would cause the general catalogue to be divided into a great number of fascicles, which would be distinguished by numbers allotted in advance. Under no other arrangement could the sale of such a catalogue be made a success, for by this method the visitor would be able to purchase separately whatever fascicle or fascicles might be needful for the portion of the exhibition which might at any time have particular interest for him. No exhibitor, surely, would complain of the small payment asked for his place in the catalogue—a charge which could not be burdensome, while the mention in the catalogue would be greatly to his profit. The income from the charges would be applied to the expenses of the respective committees intrusted with the catalogues of the different nations, and in like manner would be applied whatever might come in from the advertisements, which could be permitted on the covers and at the end of every fascicle.

NO PRIZES.

THE question of recompenses calls for a considerable simplification of the practice in former exhibitions. It is my deliberate opinion that there should be no more international juries to judge the products on exhibition and to award prizes. About all exhibitors of standing have already received premiums at one or other of the many universal exhibitions which have followed one another during the past forty years. The fear of not securing awards equal or superior to past successes, or of failing to be ranked as beyond competition owing to service as members of the jury, would have the effect of keeping away many producers without whose presence the United States exhibition would fall short of the brilliancy and the interest which ought by good right to characterize it. It is my judgment that the juries of admission to the exhibition, in the United States and in all the other countries taking part, should be so organized as to assure their action at once with great strictness and with perfect impartiality. The principle must then be established that the admission itself to exhibit is in the very beginning a

recompense, or at least an acknowledgment of merit, to the exhibitor, who will afterward receive further recompense in the appreciation of his products by the public, as well as in the business which will accrue, and the orders that will come to him. I may add that the terms of the general report of the exhibition, which might be drawn up by an international committee of men representing all specialties and taking the place of former juries, will place in their proper light any industrial or artistic excellences to which the admiration of the public, founded, as it is, often on mere appearances, may not have rendered full justice. It is not practicable that future exhibitions should offer to manufacturers, artists, agriculturists, anything more than an opportunity to bring forward their works for comparison with those of their fellows in foreign lands—a comparison platonic, indeed, in theory, but in practice full of instruction, of warning, and of revelation. I cannot urge the American commissioners too strongly to weigh carefully my opinion in this, shaped as it is by experience. I advise, however, that a diploma of admission and a commemorative medal be awarded to every exhibitor.

In treating of the matter of recompenses, I have just used the word "comparison." A comparison of objects of similar nature and use is the grand end sought in all international exhibitions. In order that this end may be perfectly attained, reform is necessary in some of the methods consecrated by preceding exhibitions. The formation of national sections should be abandoned, separated one from the other in so-called national departments, in which the exhibits are arranged more or less exactly according to the general system of classification. The ideal would be to secure the arrangement of all exhibits according to kind, however foreign to one another their place of production, in international galleries appropriated to groups or to classes. In this way it would be possible for the visitor, for example, to examine and to make a comparative study of the art of the worker in bronze or of that of the cabinet-maker, by means of specimens in juxtaposition representing the work of all the different nationalities, in each class. I admit that I put forward with some timidity an innovation so radical as this. How shall we ever be able to persuade all the national commissions to renounce the privilege of having every one its own quarters, to forego the collective display of the productive energy of every people for the spectacle in every group of a uniform whole, and no longer to seek to form within the general exhibition a lesser exhibition, often in itself imposing, displaying the arts and industries of the fatherland? What an increase of difficulty, on the other hand, would

attend the making of the catalogue and the determination of the space to be attributed to the different classes !

COURTESY TO FOREIGNERS.

WE are not informed of the plans which have been considered, or which are likely to be adopted, beyond the Atlantic, for the financial organization of the coming exhibition. I shall begin by asking that the foreign guests of the United States in 1892 may be protected from all fiscal annoyances. Upon the occasion of the Centennial Exhibition at Philadelphia the burdens imposed by the custom house were so heavy, and the service of inspectors was maintained in a form so harsh and so exasperating, that numbers of Frenchmen are afraid of encountering in 1892 such treatment as international courtesy never fails to avoid. The announcement should be made now, without loss of time, that the grounds of the exhibition will be considered as assimilated to a bonded warehouse; that duties will be imposed only upon such objects subject to them as may be actually consumed or sold in America; in a word, that only articles which are not re-exported shall pay the duties in force upon objects of their kind. In addition it is to be desired that the supervision of the inspectors of the American customs be exercised with that patience, moderation, and freedom from undue suspicion which guests from abroad have the right to expect. We have reason to hope that the commissioners and the authorities of the United States have already taken the necessary precautions to prevent the recurrence of a state of things that was deplored even by their fellow-citizens.

In my opinion, the whole cost of the projected exhibition of 1892 ought to be shared between the National Government and the city in which the exhibition is held. The Americans are a rich people; they can afford to pay roundly for the glory which awaits them. They would be tying their hands to a regrettable extent if they were to limit themselves to a fund to be furnished by a guarantee association.

THE SUM REQUIRED.

Now as to the sum required.

The cost of the official buildings, taking for their area 400,000 square meters, can be put at an average of \$30 per square meter, or.....	\$12,000,000
Cost of 500,000 square meters of parks and gardens, at \$5 per square meter,	2,500,000
Running expenses.....	1,600,000
Salaries and expenses of the general administration.....	1,000,000
Total.....	\$17,100,000

This, considering the estimated difference in the purchasing power of money, may be taken as about equivalent to eleven or twelve millions in France—the actual cost of our exhibition of 1878. The exhibition of 1889 cost us less, because the palace and park of the Trocadéro were already made to our hands, and because a portion of its park area was in existence beforehand in that part of the Champ de Mars abutting on the Seine. My rough estimate of cost for the new exhibition is made with reference to a site where it would be necessary to create everything, as was the case in the Champ de Mars in Paris in 1867 and again in 1878.

NO RENTALS.

I DO not favor the idea of requiring exhibitors to pay a rental for their space. Such a measure would be contrary to the precedent of all the great French exhibitions, to which I do not hesitate to refer as models; it would likewise be beneath the dignity of an enterprise supervised by the American Government; it would, in fine, be harassing, and yet not lucrative. An exhibitor who pays his rent takes the ground that everything he needs must be supplied him, and holds that he is chargeable with nothing but the transportation to the exhibition of his showcase and his articles. If his space is given to him gratuitously, on the other hand, he does not begrudge expenses of installation, which are often considerable; and he does not expect the administration to meet extraordinary expenses, which figure up, in general, to much more per square meter than the amount of rental of the same square meter.

I think, too, that the administration ought to furnish flooring without charge to the exhibitor, just as it gives him his roof, and that it should also give him, if it can be managed, his shades or awnings. My estimate of \$30 per square meter for construction ought to cover the flooring and the means of protection from the sun.

Water, gas, and steam power, too, should be supplied without charge; their cost, as well as that of electric lighting and of the provision of means of communication by rail, ought to be included in and covered by the estimate for running expenses.

The handling of packages upon arrival and departure, as well as transportation, unpacking, and repacking, are expenses which can properly be left to the exhibitors.

I do not advise an issue of bonds like that which was put on the market in France with the object of bringing in in advance the product of the admissions, which had been appropriated for the repayment of the guarantee fund, because I hold that the organizers of this

exhibition should have recourse to no other financial resources than the governmental and municipal appropriations. For that matter, I believe that prize-bearing obligations are not current in America. [M. Berger urges the organization of a lottery, chiefly for the partial reimbursement of the expenses of exhibitors. His argument as to this is omitted, as the suggestion is, of course, out of the question here.—EDITOR.]

All profits of the exhibition, derived from admissions, from the sale of privileges, and from the final sale of materials, should be divided between the Government and the city in which the exhibition is held, in the proportion of the contributions of each.

The admission fee might expediently be fixed, as it was last summer in France, at twenty cents for the daytime and forty cents for the evening after five or six o'clock. There should be no temporary closing of the exhibition, and no attempt to put out persons already within the inclosure at the hour of change in the price.

NO SALES.

I HAD a notion to permit at Paris, or at least to propose, the free sale of exhibits sufficiently portable to be taken away by the purchaser, under the conditions that the vacant places should at once be filled by objects of identical character, and that a percentage should be collected on such sales by the administration. I perceived, however, that this was impracticable, because the committees of admission would be overwhelmed by a horde of producers and tradesmen, who would give the exhibition the character of a mere bazar, and would deprive it of the academic quality

alone suitable to such an international gathering. I decided, therefore, to allow such a current sale only in the case of productions of the Orient and of the far East, where the manufacturers are without exception and above all traffickers, so that these classes of objects without this license would hardly have been represented on the Champ de Mars. In the light of this experience, I urge the directors of the United States exhibition to refuse all authorization to make sales during the exhibition, and to publish this decision everywhere and in advance, and to depart from their rule only in highly exceptional cases. If any other course is followed, unending confusion will be certain. The suppression of the customary jury of recompenses is an additional reason for rigid maintenance of the prohibition to sell, for it is sure that the suppression of this jury will bring together a vast and unparalleled number of exhibitors of high standing and merit, who will be glad of the chance to make their products known without having to submit them to the verdicts of judges who are too often their professional rivals; and such exhibitors as these would have good reason to complain if the mercantile spirit were allowed to dominate in a great celebration undertaken only as a masterly manifestation to the world of the supreme merits to be found in the domains of the fine arts, of agriculture, and of the industrial arts.

The United States will be well able to make a most magnificent display; and it will be a privilege to our old Europe to go to admire what a people of splendid energy has known how to accomplish during a century of freedom.

Georges Berger.

THE HARBOR OF DREAMS.

ONLY a whispering gale
Flutters the wings of the boat;
Only a bird in the vale
Lends to the silence a note
Mellow, subdued, and remote:
This is the twilight of peace,
This is the hour of release,
Free of all worry and fret,
Clean of all care and regret,
When like a bird in its nest
Fancy lies folded to rest.

This is the margin of sleep;
Here let the anchor be cast;
Here in forgetfulness deep,
Now that the journey is past,
Lower the sails from the mast.
Here is the bay of content,
Heaven and earth interblent;
Here is the haven that lies
Close to the gates of surprise;
Here all like Paradise seems—
Here is the harbor of dreams.

Frank Dempster Sherman.

THE FURROW.

HOW somber slope these acres to the sea
 And to the breaking sun! The sunrise deeps
 Of rose and crocus, whence the far dawn leaps,
 Gild but with scorn their gray monotony.
 The glebe rests patient for its joy to be.
 Past the salt field-foot many a dim wing sweeps;
 And down the field a first, slow furrow creeps,
 Pledge of near harvests to the unverdured lea.
 With clank of harness tramps the serious team.
 The sea-air thrills their nostrils. Some wide crows
 Feed confident behind the plowman's feet.
 In the early chill the clods fresh-cloven steam;
 And down its griding path the keen share goes.
 So from a scar but flowers the future's sweet!

Charles G. D. Roberts.

GIOVANNI BELLINI, 1427?–1516.

(ITALIAN OLD MASTERS.)

THE author of the article on G. Bellini in the encyclopedic "Art and Artists of the Middle Ages and Renaissance" of Dr. Dohme bases his treatise on a remarkable sample of the shallow profundity with which the study of art has been obscured by so many of the German critics, deep in their research and authoritative in their statements of fact, but, from Winckelmann down, utterly uncomprehending in their theories of art. He says "Venice was seized later than any other part of Italy by the artistic movement." This is so curiously untrue that one is obliged to conclude that the author had never been in Venice; or, if so, that he had visited only the Accademia and the churches in search of pictures. The fact is that in no part of Italy was the "artistic movement" so early or so spontaneous. When every other section of Italy owed all its art to the Lombards or Germans, and the only vestige of art of any form was Gothic or Byzantine, without any modification, as just before Cimabue, Venice had already asserted her artistic vitality by the assimilation and individualization of all that was vital and artistic in the arts of Byzantium. When St. Mark's was being built, there was no art in Tuscany which was worth mentioning, nor was there ever any native art in Rome. Until Giotto came on the scene there was more art and more "artistic movement" in Venice than in all the rest of Italy besides, but

it was not in the form of religious painting, which seems to be all that our German author has any perception of. Most of the earliest has perished, but the mosaics of St. Mark's remain, with the Cathedral itself and the Ducal Palace, to defy the western world of that epoch to measure itself collectively with the "city of the lagoons."

But in Venice the life of the individual was lost in that of the state. The passion for state ceremonials and the splendor of state pageants were enough to absorb the artistic feeling of the people; and as nobody lived for himself, so nobody thought of ordering pictures for himself. The main motive of all private encouragement of art in all ages has been personal vanity or desire for the approbation of one's fellow-citizens. These motives were rigorously suppressed by the Venetian polity; and all that existed in Venice before a time much later than the beginnings of a Venetian school of painting, be it art, be it riches, be it manhood itself, existed solely for the state. The aristocracy itself, to which our German author attributes so much, diverted only at a later period the art of Venice to the building and decoration of its private palaces; for there was never a time subsequent to A. D. 800 at which Venice had not more art in its architecture than all the rest of Italy together, if we leave out the Norman and Saracenic work in Sicily. That Venetian art did not take the form of church decoration is a consideration of no importance.

But from the purely artistic point of view,

as distinguished from the didactic, Venetian art, as soon as it began to show itself in forms of pictorial convention, began to differentiate from all other Italian art. The school of Murano may be taken as a reflection of the mosaic school, which from the eighth century must have been of great importance in Torcello and Venice; but the Vivarinis had a distinct and influential lead in the painting of the state. Of the brothers Antonio and Giovanni (called the German) we know only that they painted always together in the first half of the fifteenth century. There is in the Accademia a picture signed "Joannes et Antonius de Murano f mccccxxxx," and the last record we have of them is in the occurrence of the name of Antonio as witness of a document in 1452; and we have no evidence of Giovanni having worked with him later than 1447, when their names occur for the last time together. Bartolommeo, who is the best known of the family, is said to have been a brother of Antonio; but I am inclined to suspect a confusion of names, as he must have been about forty years younger than Antonio, his pictures being dated as late as 1499, forty-seven years later than any occurrence of the name of Antonio. He was the contemporary of Jacopo Bellini, the father of Giovanni and Gentile, though somewhat younger, and most certainly exercised an influence on the sons, as his pictures show the distinct color-motive of Venetian art—the first to show this among the work of Venetian artists. He perhaps in common with Jacopo had been influenced by Gentile da Fabriano, as the latter had been by Flemish art; and it is probable that to the younger Van Eyck was due the first suggestion of the quest of pure color of the painters of Venice.

Giovanni Vivarini had probably received a part at least of his art education in Germany; and it is not likely that he was ignorant of oil-painting, as Bartolommeo worked in both oil and tempera. But oil as a vehicle had been used by Pietro della Francesca, and I believe by Filippo Lippi, so that the reputed introduction of the method by Antonello da Messina must be apocryphal. Many influences may therefore have combined to give birth to the peculiarly Venetian school, but those influences, so far as they were exotic, were common to all Italian art; it was only when they fell on the Venetian nature that they produced a distinctive fruit. Even the triumphs of Titian never communicated their influence to any other school. In Venice the development of color is normal and complete: it begins with Vivarini, possibly contemporaneously with old Jacopo Bellini; and in Giovanni—Giambellino he is always called by the old writers—is seen in all its stages but the final,

which it reaches with Giorgione and Titian, in whom for the first time is seen the full power of a musical chord.

Meyer (*Künstler Lexikon*) says that the brothers Bellini studied perspective under Girolamo Malatini, who was at that time a teacher of mathematics in Venice. In 1454 the family moved to Padua, where, he says, the brothers came into contact with Mantegna, who entered into the most intimate relations with the family, and finally married the sister Niccolosia. The relations of the two great masters of North-Italian art have been much and conjecturally discussed, but we must remember that Bellini was now twenty-six—according to Burton possibly twenty-eight—and Mantegna twenty-three, and had been an independent master since he was seventeen. We are told that Squarcione, the master of Mantegna, had broken off his relations with him on account of his defection to the Bellinis; but this must be a supererogation, since Mantegna had been working in his own name for six years. It has been said that the work of the two masters at a certain epoch is hardly to be distinguished apart, which is surprising considering the essentially different nature of their temperaments. The explanation is perhaps to be found in the fact that they both were at one time pupils of old Jacopo; and Meyer says that "It is clear from the book of drawings now in the British Museum, from the hand of Jacopo, the father, that both Mantegna and Giovanni borrowed certain portions of their designs from this book." This book was done in 1430. Is it not probable, then, that at some earlier time, and before the manner of either of the young painters had become to any extent individualized, they had been pupils of Jacopo?

The first work that the Bellinis were engaged in at Padua, so far as we know, was the altarpiece in the Gattamelata chapel of S. Antonio, but, as is shown by an inscription, the father considered his sons as independent masters and as employed by him as such. Jacopo Bellini died in Padua and the brothers returned to Venice, where we find Giovanni at work in 1464 on some pictures for the school of S. Girolamo—works now lost. In 1472 he painted the altarpiece of SS. Giovanni and Paolo, supposed to be the last of his works in tempera, and in 1473, according to Meyer, both he and Bartolommeo Vivarini became acquainted with the work of Antonello in oil, through a "Madonna and Child" by the last, executed for S. Cassiano in Venice. In 1478 Giovanni painted the altarpiece of S. Giobbe in oil, and Vasari tells how he was, on account of this work and the earlier one in SS. Giovanni and Paolo, invited to decorate the council chamber in the Doge's palace. Gentile, the

elder brother, had already been commissioned with this work in 1474, but on his being sent to Constantinople at the request of the Sultan, Giovanni was called in to fill his place. His entry on this post was in 1479, and his compensation was to be the first vacant reversion to the office of "broker" in the Fondaco de' Tedeschi, a position which was apparently a sinecure with some profitable privileges. In 1480 a new grant was made of eighty ducats a year in the interim, with a provision for the expense of colors and implements, so that he should be of an unconcerned mind and nourish himself and his family, which is the only indication that remains to us of his having a family or of his personal history. Three years later he is freed of all expenses on account of his guild, so that he can without any anxiety give himself to the work which the state had assigned him. At the same time (1483) he is named "*Pictor Nostri Domini*" (the Doge) and painter to the state. In 1481 both brothers were at work in the council chamber of the Ducal Palace, and in 1488 Giovanni began executing his own designs there—an item of information which gives us an idea of the deliberation and preparation with which he approached his work. For, though he had always been allowed to give time to private commissions, and, in fact, had so many of them that the Signiory, in 1494, finding him too much occupied with these private commissions, threatened to employ Perugino with him, which menace brought him again to his official work,—though he is seen to have interrupted it to paint a "*Baptism of Christ*" for the Church of the Santa Corona in Vicenza,—he was nine years preparing his designs for this work.

In 1488 Vivarini was appointed to work with Bellini in the council chamber at the salary of sixty ducats a year, together with his pupils. Of all the work here executed, historical subjects, portraits of the Doges, decorations, etc., comprising the better part of the life labor of one of the noblest of painters, nothing remains, the

conflagration of 1577 having swept it all away. What remains to us are the altarpieces which he painted for the Venetian churches, and a few mythological subjects of his later years. He is to be studied mainly in Venice, where most of the altarpieces which were painted for the churches of the city are collected in the Accademia, a few being still exposed to the smoke of the candles of the altars and the chances of conflagration such as that which destroyed one of the chief of them, the great altarpiece of SS. Giovanni and Paolo, burned through the idiotic carelessness (it deserves no weaker phrase, though the popular opinion in Venice is that the priests of the church lighted the fire intentionally, to punish the Government for the removal to the Accademia of so many of the church pictures) of the ecclesiastical authorities, to which was also due the destruction at the same time of one of the masterpieces of Titian, the "*Peter Martyr*." These altarpieces generally follow a conventional scheme of Bellini's adoption: the Virgin, seated on a throne and under a canopy, is surrounded by saints and angels, the latter sometimes playing on musical instruments, and with a landscape showing on both sides of the throne.¹ The feeling of the whole is naturalistic without in the least tending to realism: the passages of open sky; the trees and distant mountains, which Giovanni seems sometimes to crowd into the composition at the risk of its harmony; the naïve and easy attitudes of the Virgin and Child; the studied arrangement of the folds of his draperies; and the warm glow of the flesh tints, which, though not at all realistic, still convey the idea of living flesh more distinctly than if they were realistic—all these qualities, new to the art of that day and probably more surprising than in ours, still distinguish the work of Bellini among the painters of Italy. To my mind one of the most important of his pictures is the "*Peter Martyr*" of the National Gallery of London. It might be considered the forerunner of modern landscape painting if it were alone in his art. The figures

¹ The charming picture of the Madonna and Child [see frontispiece], enthroned with SS. Peter, Catherine, Lucia, and Jerome in S. Zaccaria of Venice, is one of the best of these. The Madonna is seated on a high Renaissance throne, the Child standing on her knee with his left foot on her left hand—very human and real both of them. Behind the throne is the usual canopy with Renaissance ornament on the terminal pilasters, the dark hollow of its concavity furnishing the required mass of shadow which relieves the group on the throne and the throne itself. On one of the steps to the throne sits a lovely little angel in dark green and yellow robes, playing on a viol. Sta. Lucia at the right (spectator's) shows an exquisite fair profile quite individual and portrait-like. She is dressed in a gray-blue and red drapery. St. Catherine is opposed to her formally in the composition, and in the arrangement of color, a dark mass. They face each other. SS. Peter and Jerome are in similar manner opposed

to each other, and at each side of the canopy is a narrow strip of landscape, on one side a fig tree and on the other an elm or an ash—for the species is not always well marked. The draperies of the two are large and carefully composed and contrasted, St. Peter's gathered up on his left arm, like a toga, while the folds of St. Jerome's fall from the waist in straight lines. The fondness for Renaissance ornament is one of the things in which Giovanni resembles Mantegna, but this was characteristic of the epoch. The most lovely Renaissance churches that have ever been built were being raised in Venice, and in architecture as in sculpture the Renaissance was in its fullest life. Donatello had been in Padua a splendid example of the vitality of the "new birth," and there was the greatest danger that the Ducal Palace, after the fire of 1577, would be pulled down and rebuilt in the pure Renaissance, so entirely had the Renaissance come to reign in Venice.

are of little importance compared with those in his church pictures generally, and are in an important landscape, by which the painter, as by the naturalistic treatment of the subject, may have intended to distinguish this particular modern martyrdom from those of the early days of Christianity. The background against which the figures are relieved is a thicket of laurel, each leaf carefully touched and each group carefully composed, not from nature, but from knowledge of the tree, no endeavor being apparent to realize the actual effect of foliage, but the aim being simply to dwell inexhaustibly on the lovely forms of the laurel leaf in its varying positions. In the distance is a lovely hill landscape in the sunlight with an Italian town of the day rising beyond the grove. It is a work of Giovanni's old age, painted in 1514, when he was eighty-six. This must have been about the time when Albert Dürer visited him, and wrote the letter which is one of the most interesting items of personal knowledge of Bellini's character we have, and is fortunately preserved textually. Dürer writes to a friend:

I have many good friends among the Italians who tell me I should not eat and drink with Italian painters [pointing clearly to the danger of being poisoned through jealousy, a curious testimony to the moral character of the men who were, as we now imagine, so filled with the religious sentiment in their art, but who, as we see by other incidents, even in the life of Bellini, were full of professional envy and animosity]. Many are inimical to me, and also imitate my work when they see it in the churches; they also blame it because they say it is not in the old style, therefore not good, but Giambellino has praised me much, before many noble people. He would much like to have something of mine, and came himself to me and begged me to do something for him and he would pay me well. And every one says what an upright man he is. I am much attached to him. He is very old, but still the best in painting.

Dürer's testimony is important, for he was an artist of the intellectual type and that which furnishes the soundest criticism of the art of others. When, therefore, he, with the work of Titian—then in his prime—before him, says that Bellini is the best painter of Venice, he pronounces a judgment which deserves the gravest consideration, for he knew his art theoretically and practically, and was at the same time so broad in his feeling that he was not, like a painter of more limited if more intense sympathy, likely to take a partial view of the art of another painter, and his words encourage me in my own judgment of Giovanni, that he held the position in the school of Venice that Phidias did in that of Greece; he was at that summit level of art at which all the best elements and all the classic dignity and severity were still preserved, and the sensuous element

was kept in check by the intellectual and the feeling for the ideal in form. Later Giorgione and Titian revel in a far more complete abandonment to the fascinations of art and in the pursuit of "art for art's sake," just as in the Greek school Praxiteles and Scopas carried the triumphs of art, if not its refinements, to a stage beyond the Phidian. We give an intellectual adhesion to the preëminence of the Elgin marbles; but, in my opinion, every artist who is honest with himself says to himself that he likes the Hermes and the Venus of Milo better than the pediment of the Parthenon, just as he prefers the "Sacred and Profane Love" to a masterpiece of Giovanni Bellini. And we must remember that the great work of Bellini's life went in the conflagration of the Ducal Palace, and that what we have is mainly the things he did to live by or to lay up money. Titian is sometimes reckless of his own reputation and is feebler than himself, but Bellini in the work of his eighty-sixth year is as firm in his touch and as severe in his purpose as in the earliest picture we have of his. Titian carries the power of color further and gives its orchestration a sweep which Bellini could not have approved, but Bellini's were the principles and the patterns which Titian only embroidered on—that poetry of color in which the truth of nature transcends her facts and sends her messages of beauty home to the heart in a passion which the severest prose version can never awaken. The Giottesques, even down to Gozzoli, had employed color as the means of brightening the church, and the Florentine Renaissance, as the matter-of-fact language of nature, her prose; but Bellini, and the Venetians with him, sought it as music, and wrought out its contrasts and chords to heighten its brilliancy or intensify its tenderness, or subdued its crudity to the warmth and glow of flesh, or the pathos of twilight on the landscape.

The question of the introduction of oil-color has an enormous importance in the history of Venetian art. I have expressed doubt that Antonello could have been the first to bring the new vehicle to the knowledge of Bellini. As its use is indisputable in the pictures of Pietro della Francesca, and I believe of Filippo Lippi, who was in Padua, it is hardly possible that in the studies of the Vivarinis the knowledge of it should not have been included. But used as a simple vehicle to hold the pigment, and in solid painting, oil presents to a painter who is a thorough master of his material no advantage whatever. Tempera, on the contrary, had some advantages which recommend it even to our own times. A painter who is certain of his work can give it a brilliancy and prismatic force with almost absolutely permanent value such as cannot be attained in a similar use of

oil as the vehicle, *i. e.*, when both are used in solid and opaque tints. But when the oil is used as a transparent vehicle and the system of execution becomes more or less a process of glazing, the character of the work is transformed and the increase of power and brilliancy in the tints is enormous. And this it is which enabled Bellini to elaborate a system of color which would have been impossible to a painter in tempera or fresco. In these vehicles the last tint covers all that went before, so that the gradual increase of force or the studied adjustment of the opposition or harmony of the tints is impossible. In transparent color a painter may tune his work as he would a violin, and arrive at an exactitude of distinction which is out of the question in tempera. But other painters have used the same means to very little effect. Bellini had learned the use of some vehicle which did not blacken with time, and the careful and most deliberate preparation of his work, which is betrayed by the precision

of his drawing even in the least important accessories, gave to his manner a sureness and firmness of execution of the highest importance in any method, but especially in that which he finally adopted.

But these are mechanical elements of art. All the scientific and all the theoretical knowledge, as well as all the power of drawing, of Michelangelo would have been in vain had not the Venetian temperament—the sentiment of and delight in color, which no other school has ever developed—been implanted in Bellini. He found the music of color, but where we need not attempt to discover. Mystery of genius! Here we drop analysis; here the vivisection of the soul, were it possible, alone could help us.

Bellini died on the 29th of November, 1516, and was buried beside his brother Gentile in the church of SS. Giovanni and Paolo. Over his tomb ought to be inscribed, "He gave to the world a new art."

W. J. Stillman.

NOTES BY TIMOTHY COLE, ENGRAVER.

VENICE, August 23, 1889.—The Madonna and Child enthroned, of the Frari Church at Venice, forms the altarpiece of the sacristy. It measures, inclusive of its frame, about 8½ feet in width, and is composed of three panels separated from one another by the framework. The central one, representing the Madonna and Child enthroned under a canopy, is higher than the two side ones by some 29 or 30 inches. It is 31 inches wide by about 75 inches high, and is arched at the top. In the detail given I have left out this canopy from where the arch begins to spring, in order to get the main portion as large as possible on the block, thus cutting off some twenty odd inches of the original. The rest of the panel is given entire.

The panels on each side are 19 inches wide by about 46 inches high, and represent the four Evangelists standing, two on each panel. The whole is inclosed in a beautiful frame richly ornamented with arabesques in low relief. It consists of a predella, upon which rest four pilasters which separate the panels from each other. These are surmounted by cornices over the side panels, while from those portions of the cornices supported by the inner pilasters springs the arch over the center panel. Over the cornices of the side panels, and surmounting the framework proper, are grotesque figures of winged mermaids whose fish-like bodies wind and end in scrolls. There are two over each side panel, between two handsome candlesticks. The arched center panel is capped by a handsome ornament of fruit mingled with grotesque fish, from the center of which rises an urn from which flames ascend, as from the candlesticks also.¹ The frame forms part of the picture, and is repeated in

it; as for instance in the side panels where the pilasters of the exterior of the frame are shown in perspective behind the Evangelists. So are they seen in the center panel receding in perspective and forming the support to the cornice running round behind the Madonna.

The work is painted on wood, in oil apparently, and is very rich and mellow in coloring. Above the Madonna is a dome filling the arch. This is heaven opened, and is formed of golden clouds parting to each side, disclosing a glory of light. Here appears a Latin inscription of two lines to the Madonna. This golden portion seems to glow with a light of its own—an effect obtained perhaps by glazing upon a gold ground. The background behind the Madonna, and below the warm marble cornice, is of a deep rich carmine burning like a ruby. It is ornamented with a pattern in gold, which in the lighted portion sparkles with a soft and quiet luster. The drapery is of a rich, harmonious blue, the dark folds of which are intensely deep. The underrobe is red, similar in tone to the background, but brighter. The throne is of a reddish-brown marble, glowing golden on the lighted side, while the clouds and veins in the marble give added richness of color. Bellini's name, in gold, is inscribed in the middle, with the letter F (*fecit*) beneath and the date 1488. The flesh tints are mellow and bright as though illumined by a golden light. How charming are the angels at the foot of the throne—the one crowned with myrtle piping, the other accompanying his song on the lute! How buoyant and resolute the Child stands! The Mother scarcely rests her hands upon him. The Child occupies a height in the picture of fifteen inches.

T. Cole.

¹ Evidently a later addition to the decoration of the frame.—W. J. S.

MADONNA AND CHILD, BY GIOVANNI BELLINI.

(DETAIL OF ALTARPIECE IN THE SACRISTY OF STA. MARIA GLORIOSA DE' FRARI, VENICE.)

THE SHRINES OF IYÉYASŪ AND IYÉMITSŪ IN THE HOLY MOUNTAIN OF NIKKO.

AN ARTIST'S LETTERS FROM JAPAN.

BY JOHN LA FARGE.

WITH PICTURES BY THE AUTHOR.

PORTRAIT-STATUE OF IYÉYASŪ IN CEREMONIAL DRESS.

JULY 25.— From where we are in the Holy Mountain, our first visit would be naturally to the shrine of the shōgun Iyéyasū, whose extreme walls I see among the highest trees whenever I look

from our balcony over our little waterfall.

Iyéyasū died in 1616, having fought, he said, ninety battles and eighteen times escaped death, having almost destroyed Christianity, and leaving his family established as rulers of Japan. In obedience to his dying wishes, his son and successor removed the body of his father from its resting-place in the south to this final tomb at Nikko. Here, in 1617, with complicated and mystic ceremonial, he was buried and deified.

If you have no work on Japan near by to refer to, *sub voce* Iyéyasū, I can tell you, briefly, what he did or what he was, though I, too, have no books at my hand. He was a great man, a patient waiter upon opportunity, who at the end of the sixteenth century came upon the scene of a great civil war, then filled by two protagonists, the military ruler, Nobunaga, and his lieutenant, Hidéyoshi, who was to be known later as Taiko Sama. Their aim was to settle something more definitely, of course in

their favor; and, in fact, the death of the former and the triumphant success of the latter, who succeeded him, went far towards disposing of many contending claims, and towards a crystallizing of the feudal system, which had grown of centuries of civil war. This is the moment that we see reflected in the annals of the first Christian missionaries, to whom the military chiefs of Japan were alternately kind or cruel.

When Hidéyoshi died he had grown to be the master of Japan; he had been made Regent of the Empire, as a title of honor, for he was that and more in reality; he had become one of the greatest of Oriental warriors, and had begun life as a groom, the son of a humble peasant. The name of Taiko (great gate) he took like other regents, on retiring nominally from office, but with the addition of Sama (Lord) it is applied to him alone in popular memory. Naturally, then, he believed in a possible dynasty originating in him. At his death he could see, as his greatest fear for the future of the young son to whom he wished to leave his power, this man Iyéyasū Tokugawa, lord now of many provinces, but who had begun humbly, and who had assisted him in breaking many enemies, receiving a reward

with every success, and consolidating meanwhile his own smaller powers. The dying Taiko made complicated arrangements to secure the good-will of Iyéyasū, and also to prevent his encroachments. These arrangements, including and combining the agencies of numbers of princes and vassals, many of them newly Christianized, seem only the more certainly to have forced on a position in which Iyéyasū, with few allies, but with clear aims and interests, took the field against a larger number of princes, commanding more men, but not united in any intention as fixed as his was. These he defeated for once and all, on a great battlefield, Sékigahara, on some day in October in the year 1600. It was the greatest battle that Japan ever saw, and one of the bloodiest — remarkable for us because of the death of three of the Christian leaders against Iyéyasū, warriors distinguished before in many wars, who could not, being Christians, take their own lives in defeat, as their Japanese traditions of honor commanded. Hence the victor had them beheaded—a shameful death, and thereby heroic. These were almost his only immediate victims. Iyéyasū wisely forgave, when it paid, and merely weakened the beaten, increasing the possessions but not the powers of his adherents; and finally remained in undisputed power, with great titles from the mikado, who, though poor in power, was still a dispenser of honors, for, as with the greater gods, the *victrix causa* pleased.

Meanwhile the protection of the son of the great Taiko Sama, for which all this war had been supposed to grow, had not been effected, and even this one obstacle or reminder was to disappear from before Iyéyasū, but not for several years, and only just before his death.

He had, in Japanese custom, resigned his apparent power to his son, for behind him he could act more obscurely and with less friction. Then began the drama of the extinction of Christianity; slowly, for many reasons, not the least being that several Christian princes, with their vassals, had supported Iyéyasū in his struggle. And at length the son of Taiko Sama, Hidéyori, indirectly connected with the Christian side, fell before Iyéyasū. His strong castle at Osaka was said to have become a place of refuge for the persecuted and the discontented, even to the very Christians whom his father had cruelly persecuted.

Which was in the wrong and disturbed the waters, the wolf or the lamb, I do not know, but only that in June, 1615, the great castle was attacked by Iyéyasū and his son in as bloody a battle as was ever fought; and notwithstanding that for a moment victory hung in the balance, the Tokugawa Luck prevailed, the castle took fire, thousands perished, and Hidéyori and his mother disappeared.

Whether Iyéyasū was the author of the code of laws or rules at which he is supposed to have worked during these years of waiting, with the aid of learned scholars, to bequeath them to his descendants for the maintenance of the order of things he left, I do not know; nor perhaps was the information I once had about them at all accurate. They, or their spirit, however, served to guide the nation for

the next two hundred and fifty years; that is to say, until the second Commodore Perry came to Japan, with the increased weight of an outside world much changed.

Meanwhile the great man died, leaving a great personal fame behind him, over and above the powers he could transmit.

He was buried here, as I said. The place

SKETCH OF STATUE OF IYÉYASŪ
TOKUGAWA.

was chosen in 1616: at the end of the same year the buildings were begun, and in the beginning of the next year were partly completed. When the funeral procession arrived, in nineteen days from Iyéyasū's former resting-place, amid great ceremonies and religious rites the title of "Supreme Highness, Lord of the East, Great Incarnation," was given to the hero and ruler and son of the small laird of Matsudaira.

While he was being thus deified the persecution of the Christians increased in violence, passing into a hideous delirium of cruelty; wiping out its victims, but unable to affect their courage. There can be apparently no exaggeration of the sufferings of the martyrs nor of the strength of mind shown by them—a courage and constancy ennobling to Japan.

Hidetada, the son of Iyéyasū, is buried at Yeddo (Tokio); but Iyémitsū, the grandson, has a temple and a tomb here in the forest, alongside of his grandfather's.

He succeeded to power in 1623, and lived and ruled some thirty years more with an energy worthy of Iyéyasū, and carried the system to completion. The laws known as the laws of Iyéyasū are sometimes made out to be his. These laws, based on the old feudal habits, and influenced and directed by the great Chinese doctrines of relationships and duties, are not laws as we think of law, nor were they to be published. They were to be kept secret for the use of the Tokugawa house; to serve as rules for conduct in using their power, so as to secure justice, which is in return to secure

AVENUE TO TEMPLE OF IVÉYASŪ.

power, that exists for its own end in the mind of rulers. These laws, some of which are reflections, or moral maxims, or references to the great man's experience, made out a sort of criminal code,—the relations of the classes,—matters of rank and etiquette, and a mechanism of government. They asserted the supremacy and at the same time destroyed the power of the mikado, and by strict rules of succession, residence, and continued possession bound up the feudal nobles. They reasserted the great individual virtues of filial piety and of feudal loyalty, and insisted on the traditions of military honor. "The sword" was to be "the soul of the Samurai," and with it these have carried the national honor and intelligence in its peculiar expressions.

Full recognition was given to the teaching, "Thou shalt not lie beneath the same sky, nor tread on the same earth, with the murderer of thy lord." The rights of the avenger of blood were admitted, even though he should pay the penalty of his life.

Suicide, which had long been a Japanese development of chivalrous feeling and military honor, was still to be regarded as purifying of all stain, and, for the first time, allowed in mitigation of the death penalty.

Indeed, half a century later, the forty-seven Ronin ("wave-people"—Samurai who had lost their natural lord and their rights) were to die in glorious suicide, carrying out the feudal ideal of fidelity.

You know the story probably; at any rate you will find it in Mitford's tales of old Japan. It is a beautiful story, full of noble details, telling how, by the mean contrivance of a certain lord, the Prince of Ako was put in the wrong, and his condemnation to death and confiscation obtained. And how, then, forty-seven gentlemen, faithful vassals of the dead lord, swore to avenge the honor of their master, and for that purpose to put aside all that might stand in the way. For this end they put aside all else they cared for, even wife and children, and through every obstacle pursued their plan up to the favorable moment when they surprised, on a winter night, in his palace, among his guards, the object of their vengeance, whose suspicions had been allayed by long delay. And how his decapitated head was placed by them upon his victim's tomb, before the forty-seven surrendered themselves to justice, and were allowed to commit suicide by *hara-kiri*, and how they have since lived forever in the memory of Japan.

STABLE OF SACRED HORSES.

These laws, then, destroyed nothing; they reasserted certain Japanese traditions and customs, but made out, through many details, the relations of dependence of all classes of society upon the shōgun, as vassal indeed of the mikado, but supreme ruler who held the key of all. All this did Iyémitsū carry out, as well as the consequent seclusion of the country; the only manner of avoiding ideals which might clash with those upon which this consolidation of the past was based. And to many of these ideals, to the idea of the sacredness of the family, to the idea of subjection to the law of the ruler, Christianity, by its ideal of marriage, by its distinctions of the duty to Cæsar,—to name only a few reasons,—might be found an insidious dissolvent. Therefore, if it be necessary to find a high motive, Iyémitsū did what he could to trample out the remains of Christianity; which were to expire, a few years after his death, in a final holocaust as terrible and glorious as Nero himself could have wished to see.

From that time, for two centuries, all went on the same, until the arrival of the foreigners found a system so complete, so interlocked and rigid, as to go to pieces with the breaking of a few links.

That break was supplied by the necessity of yielding to the Christian and foreign demand of entrance, and in so far abandoning the old ways.

With this proof of weakness the enemies of the Tokugawa and those of the system began to assert themselves, circumstances aiding, and in 1868 the last of the race resigned all powers and retired to private life.

The details of the enormous changes, as they followed one another, are too many and sudden, and apparently too contradictory, for me to explain further. Even now I repeat this deficient summary of the Tokugawa story only because of wishing to recall who they were that have temples and tombs about us, and to recall, also, that such has been the end of the beginning which is buried here.

THE approach to the temple, to which most paths lead, is through a great broad avenue, a quarter of a mile long, bordered by high stone walls, above which rise high banks and higher trees. Between these dark green walls, all in their own shade,—in the center of the enormous path and in the full light of the sky,—a brilliant torrent rushes down in a groove of granite, hidden occasionally under

the road. Here and there drop out from the walls noisy columns of clearest water.

In the distance beyond, through a mass of closer shade, made by two rows of dark cryptogamia, that are planted on banks faced with stones,—for here the road divides into three different grades of ascent by enormous steps,—shine the high white walls of the temple grounds, edged with a red-lacquered fence and a black

Two monsters of uncertain lion-form occupy the niches on each side. From the upper side of the red pillars, as supports for the engaged lintel, stretch out the gilded heads of tapers,—protectors against pestilence,—of lions and elephants, and great bunches of the petals of the peony. Above, the architrave and frieze are painted flat with many colors and with gold, and the ends of the many beams which

SACRED FONT.

roofed gate of red and gold. In the open space before it, with wide roads diverging through high walls, crowned with scarlet fences, stands a granite Torii, some thirty feet high, whose transverse stones are crossed by a great black tablet, marked with the gilded divine name of Iyéyasū. On one side a five-storied pagoda, graceful and tall, certainly one hundred feet high, blood-red and gold in the sunlight, and green, white, and gold in the shadows of its five rows of eaves, rises free from the trees around it and sends a tall spear, encircled with nine gilded rings, into the unbroken sky. Bindings and edges of copper, bright green with weathering, sparkle on its black roofs, and from their twenty corners hang bells of bright green copper. Above the steep steps, against the white wall, we pass through the first gate. It is recessed, and two gigantic columns of trees stand in the corners.

support the roofing are gilded. Everywhere, even to the ends of the bronze tiles of the black roof, the crest of Iyéyasū's family, the Tokugawa, is stamped in gilded metal.

At the inside corner of the gate stands a gigantic cedar, said to have grown to this height since the time when Iyéyasū carried it about with him in his palanquin. Opposite to three red buildings, which are storehouses for the memorial treasures of the temple, stands closer to the wall a charming building, mostly gray,—partly owing to the wearing of the black lacquer with time,—and decorated with carved panels which make a frieze or string-course all around its sides. Above this line of green, red, blue, white, and gold, a large space of gray wood, spotted with gilt metal where the framework of the outer beams is joined, spreads up to the pediment under the eaves, which is all

YOUNG PRIEST.

carved and painted on a ground of green. The heavy roof above is black bronze and gilded metal and is spotted with the golden Tokugawa crest. Below the colored band, midway, the black wall has gratings with golden hinges, for this delicate splendor is given to a stable—the stable of the sacred horse of the god Iyéyasū. The patient little cream-colored pony has no look of carrying such honors; and I can scarcely imagine his little form galloping out in the silence of the night under the terrible rider.

A gentle splashing of water, which mingles with the rustling of the trees and the quiet echoes of the pavement, comes from the end of the court, where its edge is a descent filled with high forest trees. This lapping sound comes from the temple font, a great wet mass of stone, looking like solid water. It has been so exactly balanced on its base that the clear mountain stream overflows its sides and top in a perfectly fitting liquid sheet. This sacred

well-basin has a canopy with great black bronze-and-gold roof, supported by white stone pillars, three on each corner, that are set in bronze sockets and strapped with gilded metal. The pediment and the brackets which cap the pillars are brilliantly painted, and the recessed space below the curved roof-beam is filled with palm-like curves of carved waves and winged dragons. Next to this, and at right angles to it, is a heavy bronze Torii, through which we go up to another court, turning away from the buildings we have seen. On the dark surface of the Torii glisten the golden Tokugawa crests; on the great tie-beam, the upper pillars, and the central upright. Near us, the eaves of its lower roof continuing the lines of the water tank pavilion, is the closed library, red, delicately adorned with color under the eaves, and with the same heavy black roofing of bronze dotted with gold which all the buildings have in a heavy monotony. The steps lead us to another court, spotted with different buildings, among tremendous trees—a bronze pavilion with a hanging bell, a bell tower, and a drum tower, closed in with sloping walls of red lacquer, and a large lantern of bronze under a bronze pavilion, whose curious, European, semi-Gothic details contrast suddenly with all this alien art, and prove its origin a tribute from trading Christian Holland to the mortal deity worshipped here. On one side, where the forest slopes down in sun and shadow, stands a Buddhist temple, sole survivor of the faith in this place, now turned over to the official and native worship. The latticed gold-and-black screens were all closed, except in the center, through which we could see the haze and occasional glitter of the gold of gods and altar ornaments, and the paleness of the mats. On its red veranda stood a young Buddhist priest, whom our companions knew; a slight, elegant figure, a type of modesty and refinement. Farther back, on the other side of the veranda, an older companion looked down the valley at some girls whose voices we could hear among the trees.

The main entrance rises above the high steps to a little esplanade with heavy railing, on the level of a higher embankment. The court that we were in was full of broken shadows from its own tall trees, and from all this accumulation of buildings, red-lacquered and gilded, black-and-bronze roofed, spotted and stained with moss and lichens, or glittering here and there in their many metals. Long lines of light trickled down the gray trunks and made a light gray haze over all these miscellaneous treasures. Great lanterns (toro) of stone, capped with green and yellow moss, metal ones of bronze and iron, stand in files

together here and in the lower court, or are disposed in rows along the great stone wall, which is streaked by the weather and spotted with white and purple lichens. Along its upper edge runs the red-lacquered wall, heavily roofed, of the cloister which surrounds the farther court above. Its face is paneled between the metal-fastened beams and posts with two rows of deep carvings of innumerable birds and trees and waves and clouds and flowers. All these are painted and gilded, as are the frieze above and the intervals between the gilded rafters.

the guardian statues of foxes that protect the entrances of the primitive shrines of the land-god Inari. The far-projecting white capitals are the half-bodies of lion-like monsters with open mouths and stretched-out paws. Above these, below the carved balcony which marks the second story, the cornice is made of a wilderness of tenfold brackets, black lacquered and patterned with gold, and from each of the ten highest ones a gilded lion's head frowns with narrowed eyes.

The balcony is one long set of panels — of little panels carved and painted on its white

DETAILS OF BASES OF CLOISTER WALLS, INNER COURT.

On all this space and on the great white gate, the "Gate Magnificent," the full sun embroidered the red and white and colored surfaces with millions of stitches of light and shadow.

The gate, or triumphal arch, is a two-storied building with heavy bronze-tiled roof, capped and edged, like all the rest, with gilded metal, and spotted with the gilded crest of the Tokugawa. Its front towards us rises in the well-known curve, shadowing a pediment, full of painted sculpture. Eight white pillars embroidered with delicate reliefs support the white lintel, which is embossed with great divine monsters and strapped with gilded metal. In the niches on each side are seated two repellent painted images, inside of white walls, which are trellises of deeply carved floral ornament. These figures are warriors on guard, in ancient and Japanese costume, armed with bows and quivers of arrows, whose white, wrinkled, and crafty faces look no welcome to the intruder, and recall the cruel, doubtful look of

line with children playing among flowers. Above, again, as many white pillars as below; along their sides a wild fringe of ramping dragons and the pointed leaves of the bamboo. This time the pillars are crowned with the fabulous dragon-horse, with gilded hoofs dropping into air, and lengthy processes of horns receding far back into the upper bracketings of the roof. Upon the center of the white-and-gold lintel, so delicately carved with waves as to seem smooth in this delirium of sculpture, is stretched between two of the monster capitals a great white dragon with gilded claws and gigantic protruding head. But all these beasts are tame if compared with the wild army of dragons that cover and people the innumerable brackets which make the cornice and support the complicated rafters under the roof. Tier upon tier hang farther and farther out, like some great mass of vampires about to fall. They are gilded; their jaws are lacquered red far down into their throats, against which their white teeth glitter. Far into the shade spreads

DETAIL OF CLOISTER WALLS, INNER COURT.

a nightmare of frowning eyebrows, and pointed fangs and outstretched claws extended towards the intruder. It would be terrible did not one feel the coldness of the unbelieving imagination which perhaps merely copied these duplicates of earlier terrors.

So it is, at least in this bright, reasonable morning light; but I can fancy that late in autumn evenings, or in winter moonlight, or lighted by dubious torches, one might believe in the threats of these blinking eyes and grinning jaws, and fear that the golden terrors might cease clinging to the golden beams. It is steady to the eye to meet at last the plain gold-and-black checker pattern of the ends of the final rafters below the roof, and to see against the sky peaceful bells like inverted tulips, with gilded clappers for pistils, hanging from the corners of the great bronze roof.

And as we pass through the gate we are made to see how ill omen was turned from the Luck of the Tokugawa by an "evil-averting pillar," which has its pattern carved upside down as a sacrifice of otherwise finished perfection.

I noticed also that a childish realism has furnished the lower monsters of the gate with real bristles for their distended nostrils; and this trifle recalls again the taint of the unbelieving imagination, which insists upon small points of truth as a sort of legal protection for its failing in the greater ones.

Within this third cloistered court which we now entered is an inclosed terrace, some fifty yards square. Inside of its walls are the oratory and the final shrine, to which we can pass through another smaller gate, this time with lower steps. The base of the terrace which makes the level of the innermost court is cased with large blocks of cemented stone. Above it is a fence or wall with heavy roof and project-

ing gilded rafters. Great black brackets support the roof. Between them all is carved and colored in birds and flowers and leaves, almost real in the shadow. Between the decorated string-courses the wall is pierced with gilded screens, through which play the lights and darks, the colors and the gilding of the shrine inside. At the very bottom, touching the stone plinth, carved and painted sculptures in high relief project and cast the shadows of leaves and birds upon the brilliant granite.

Beyond this inclosure and the shrine within it the court is abruptly ended by a lofty stone wall, high as the temple roof, and built into the face of the mountain. From its very edge the great slope is covered with tall trees that look down upon this basin filled with gilding and lacquers, with carvings and bronze, with all that is most artificial, delicate, labored, and transitory in the art of man.

It is in this contrast, insisted upon with consummate skill, that lies the secret beauty of the art of the men who did all this. The very lavishness of finish and of detail, the heaped-up exaggerations of refinement and civilization, bring out the more the simplicity and quiet of the nature about them. Up to the very edges of the carvings and the lacquers grow the lichens and mosses and small things of the forest. The gilded temples stand hidden in everlasting hills and trees, open above to the upper sky which lights them, and to the changing weather with which their meaning changes. Nothing could recall more completely the lessons of death, the permanence of change, and the transitoriness of man.

We went up the steps of the recessed gate, which repeats the former theme of white and gold and black in forms of an elegance that touches the limits of good taste. Its heavy black roof, whose four ridges are crowned by

long bronze dragons and crawling lions, opens in a high curve on the front and sides to show under the bent white-and-gold ridge-beams a pediment strapped and intersected by spaces of small carvings, white and tinted, relieved by red perpendiculars of beams.

White and gold shine in the great brackets and the recesses of the rafters. Below the white frieze, carved with many small figures of Chinese story, the pillars and the lintel are inlaid in many carved woods, ornaments of dragons, plants, and diapered patterns on the

palings, or great beasts, types of power, might show great limbs through confining barriers. The long building, indeed, is a great framework, strongly marked, dropped on a solid base, and weighted down by a heavy roofing. The white pillars or posts which divide its face and corners stand clear between the black-and-gold latticed screens, partly lifted, which make almost all its wall.

Strips of the sacramental white paper hang from the lower lintel against the golden shade of the interior. Inside, pale mats cover the

LINTEL, BRACKET CAPITAL.

whitened ground. The opened doors repeat the same faint tones of wood, and of white and gold, and of gilded metals. The walls, which are open at the base, are merely lattice screens. Their exquisite flowered patterns fluctuate with gilded accents of whites, greens, lavenders, and blues.

The gate inside is, therefore, nothing but an ornamented trellis, made still lighter by contrast with the solid white doors, trellised at top, but whose lower panels are exquisitely embellished with inlaid carved woods and chiseled golden metal. We took off our shoes, and ascended the bronze-covered steps of the oratory and shrine, which come down from the red-lacquered veranda, behind the four carved white pillars of the descending porch. Great white dragons with spiky claws project from the pillars, and crawl in and out of the double transom. In the shadow of the roof golden monsters hang from the complex brackets. The friezes and bands of the temple face are filled with carving, delicate as embossed tapestry, while the panels, deeply cut into auspicious forms of birds and flowers, carry full color and gold far up into the golden rafters.

ALL recesses and openings are filled with half-realities, as if to suggest a dread or a delicious interior, as flowers might pass through

black-lacquer floor. Exquisite plain gold pillars, recalling Egyptian shapes, divide the gilded central walls. Here and there on the gilded tie-beams curved lines of emerald-green or crimson, like tendrils, mark with exquisite sobriety a few chamfered cuttings. On either side of the long room (fifty feet) are two recesses with large gold panels on which symbolic forms are freely sketched, and carved inlays of emblematic birds fill their farthest walls. Their ceilings are carved, inlaid, and painted with imperial flowers, mystic birds, and flying figures, and the pervading crest of the Tokugawa. For these were the waiting-rooms of the family, and, as A—— remarked, the impression is that of a princess's exquisite apartment, as if the Tartar tent had grown into greater fixity, and had been touched by a fairy's wand.

All was bare except for an occasional sacred mirror, or hanging gilded ornament, or the hanging papers of the native worship; and this absence of the Buddhist images and implements of worship left clear and distinct the sense of a personal residence—the residence of a divinized spirit, not unlike the one that he was used to in life.

Even more, on the outside of the building the curved stone base, like a great pedestal, with pierced niches filled with flowers carved and painted between the great brackets that

INSIDE THE "CAT GATE"—GATE TO THE TOMB.

support the veranda, makes the temple seem as if only deposited for a time, however long that time may be.

We merely looked at the central passage, that, dividing the building, leads down and then up to the shrine itself, and waited for the time when we shall get further permission, and I shall be allowed to sketch and photograph. As for me, I was wearied with the pleasure of the endless detail; for even now, with all my talk, I have been able to note but a little of what I can remember.

We withdrew, put on our shoes again at the gate, and turned below to the east side of the court. We passed the Hall of Perfumes, where incense was once burned while the monks chanted prayers in the court, as they did when Iyéyasū was buried. We passed the Hall of the Sacred Dances, whose open front makes a large, shady, dim stage, with a great red railing on its projecting edge. Within it moved a white shadow, the figure of a woman dancer. And then we came to a white-and-gold gate, inside of the roofed cloister wall. Above the

open door that leads to it sleeps a carved white cat, in high relief, said to have been the work of a famous left-handed sculptor, carpenter, and architect. Its cautious rest may not have been so far from the habits of the living Iyéyasū, to whose tomb, farther on, this is the entrance.

Framed by the gold and white of the gate and of the half-opened door rise the steps built into the hillside and all carpeted with brilliant green mosses. The stone railings, which for two hundred feet higher up accompany the steps, are also cushioned with this green velvet, and our steps were as noiseless as if those of the white cat herself. All is green, the dark trees descending in sunlight to our right and rising on the bank to our left, until we reach an open space above, with a bank of rocky wall inclosing the clearing.

Here is the small final shrine, and behind it a stone esplanade with a stone fence, within which stands, in the extreme of costly simplicity, the bronze tomb of Iyéyasū. A large bronze gate, roofed in bronze, of apparently a single

casting, with bronze doors, closes the entrance. Before the monument, on a low stone table, are the Buddhist ornaments — the storks, the lotus, and the lion-covered vases, all of brass and of great size.

The tomb itself is of pale golden bronze, in form like an Indian shrine: a domed cylinder surmounted by a great projecting roof which rises from a necking that separates and connects them — above the roof a finial in the shape of a forked flame. Five bronze steps, or bases,

of time, no apparent attempt at an equal permanency; it is like a courteous acceptance of the eternal peace, the eternal nothingness of the tomb.

We leaned against the stone rails and talked of Iyéyasū — of his good nature, of his habit of chatting after battle, of his fraudulent pretensions to great descent; and of the deadening influence of the Tokugawa rule, of its belittling the classes whose energies were the true life of the country. We recognized, indeed, that

TOMB OF IYÉYASŪ TOKUGAWA.

support this emblematic combination of the cube, the cylinder, and the globe.

The crest of the Tokugawa, ten times repeated, seals the door upon the burnt ashes of the man who crystallized the past of his country for three centuries, and left Japan as Perry found it. All his precautions, all his elaborate political conservatism, have been scattered to the winds with the Luck of the Tokugawa, and the hated foreigner leans in sight-seeing curiosity upon the railing of his tomb.

But the solemnity of the resting-place cannot be broken. It lies apart from all associations of history, in this extreme of cost and of refined simplicity, in face of the surrounding powers of nature. There is here no defiance

the rulers of Iyéyasū's time might have perceived the dangers of change for so impressionable a race, but none of us asked whether the loss of hundreds of thousands of lives of courageous Christians had been made up in the strength of the remaining blood.

Far away the sounds of pilgrims' clogs echoed from the steps of distant temples; we heard the running of many waters. Above us a few crows, frequenters of temples, spotted the light for a moment, and their cries faded with them through the branches. A great, heavy, ugly caterpillar crept along the mossy edge of the balustrade, like the fresh incarnation of a soul which had to begin it all anew.

John La Farge.

TOLSTOI.

SAY not sublimity is dead to-day.
A force Titanic labors on this page—
Tolstoi! The long-foregone Homeric rage
Over our throbbing hearts through thee holds sway.
Thou prob'st the mystery of death's decay,
The glow of youth, the weariness of age.
Yet, as the Orient kings left priest and sage
Their crowns before the infant Christ to lay,
Thou, to thy Master's mandates reconciled,
Deeming that wealth and ease of life are sin,
Stripped of the glory that renown can win,
Low kneeling, prayest of the Saviour mild,
"Renew in me the spirit of a child,
That to thy kingdom I may enter in."

Margaret Crosby.

A FRIENDSHIP.

SMALL fellowship of daily commonplace
We hold together, dear, constrained to go
Diverging ways. Yet day by day I know
My life is sweeter for thy life's sweet grace;
And if we meet but for a moment's space,
Thy touch, thy word, sets all the world aglow.
Faith soars serener, haunting doubts shrink low,
Abashed before the sunshine of thy face.
Nor press of crowd, nor waste of distance serves
To part us. Every hush of evening brings
Some hint of thee, true-hearted friend of mine;
And as the farther planet thrills and swerves
When towards it through the darkness Saturn swings,
Even so my spirit feels the spell of thine.

Ellen Burroughs.

A MYSTERY.

THAT sunless day no living shadow swept
Across the hills, fleet shadow chasing light,
Twin of the sailing cloud: but mists wool-white,
Slow-stealing mists, on those heaved shoulders crept,
And wrought about the strong hills while they slept
In witches' wise, and rapt their forms from sight.
Dreams were they — less than dream, the noblest height
And farthest; and the chilly woodland wept.
A sunless day and sad: yet all the while
Within the grave green twilight of the wood,
Inscrutable, immutable, apart,
Harkening the brook, whose song she understood,
The secret birch tree kept her silver smile,
Strange as the peace that gleams at sorrow's heart.

Helen Gray Cone.

THE SERPENT MOUND, SERPENT MOUND PARK, NEAR LOUDEN, ADAMS COUNTY, OHIO.

THE SERPENT MOUND OF OHIO.¹

IN September, 1883, in company with four fellow-archæologists, I started from Hillsborough, in Highland County, Ohio, on an excursion to several ancient earthworks which we had long wished to see. Our plans were so arranged as to take us first of all to the Serpent Mound, thence to Fort Hill, and down Paint Creek to the Scioto, stopping from day to day to visit the most interesting of the many ancient works along the route.

Approaching the "Serpent Cliff" by fording Brush Creek from the west, our attention was suddenly arrested by the rugged overhanging rocks above our heads, and we knew that we were near the object of our search. Leaving the wagon, we scrambled up the steep hillside, and pushing on through bush and brier were soon following the folds of the great serpent along the hilltop. The most singular sensation of awe and admiration overwhelmed me at this sudden realization of my long-cherished desire, for here before me was the mysterious work of an unknown people, whose seemingly most sacred place we had invaded. Was this a symbol of the old serpent faith, here on the western continent, which from the earliest time in the religions of the East held so many peoples enthralled, and formed so important a factor in the development of succeeding religions?

Reclining on one of the huge folds of this gigantic serpent, as the last rays of the sun, glancing from the distant hilltops, cast their long shadows over the valley, I mused on the probabilities of the past; and there seemed to

¹ See also an article in the last number by the same author.

come to me a picture as of a distant time, of a people with strange customs, and with it came the demand for an interpretation of this mystery. The unknown must become known!

This thought took complete possession of me, and on that same evening arrangements were made with Mr. Lovett, the owner of the land, to have the place cleared of underbrush that we might see the great work in its entirety. By noon of the following day the clearing was

THE SERPENT CLIFF AS SEEN FROM BRUSH CREEK.

SUNRISE VIEW OF THE SERPENT MOUND.

roughly made, and the view thus obtained of the serpent and the egg—as the oval work in front of its jaws has been called—led to a still stronger desire to know more, and a resolve to do all in my power to preserve this singular structure, which seemed so strangely transplanted from the mythology of the East.

When Squier and Davis, after their survey in 1846, gave to the world the first account of this earthwork, it was covered with a thick forest, from which many a noble tree has been cut, as indicated by stumps still standing at the time of our visit. Thirteen or fourteen years after their visit a tornado swept its path directly along the serpent hill, and with the exception of a few saplings the forest was laid low. This led to clearing the land, and to the cultivation for a few years of the portion occupied by the serpent. Nature soon covered the scars with a protecting sod, which was followed by a growth of sumach, redbud, and briars.

On my return to the East I took every opportunity of urging the importance of preserving the Serpent Mound, as well as other ancient monuments. In 1885 I again visited the serpent, and finding that its destruction was inevitable unless immediate measures were taken for its preservation, I secured a contract that it should remain intact for a year, and agreed upon a price for its purchase. Returning home I urged anew the importance of its preservation. Yet, although an interest was awakened in the object, I fear it might have come to

naught if Miss Alice C. Fletcher, meeting in Newport a few Boston ladies, had not taken the opportunity to appeal to them for assistance in the work which she knew I had so much at heart, and which was, at the same time, so thoroughly in accordance with her own views. Her earnest presentation of the subject had the desired effect. In the winter of 1886 several of Boston's noble and earnest women issued a private circular which had the indorsement of Mr. Francis Parkman and Mr. Martin Brimmer of the Corporation of Harvard University. Subscriptions were solicited to purchase the Serpent Mound, which was to be given in trust to the Peabody Museum for perpetual preservation, and also to enable me to carry on such explorations of the work and its surroundings as might throw light on its origin and purpose. This appeal was cordially met, and in June, 1886, I was provided with nearly \$6000 with which to buy such land as seemed to be required for the purpose in view, and to take steps for the preservation of the serpent, while at the same time I made such explorations as seemed desirable. The trustees of the Museum, of whom the Hon. Robert C. Winthrop has been chairman since Mr. Peabody founded the Museum, in connection with Harvard University, in 1866, accepted this additional trust, and about sixty acres of land were at once purchased in the name of the trustees. Soon after, several acres of land along the new pike leading from Hillsborough to

Peebles, the nearest railroad stations, were added to the purchase, and the whole was laid out as the Serpent Mound Park, of which Brush Creek forms the western boundary.

Here for three seasons, living in tents, I have carried on the work of protecting the serpent, exploring its surroundings, and laying out the grounds. This beautiful park, with the wonderful stories it tells of the past, is now, thanks to the women of Boston, open to all visitors. In appreciation of what has been done for the State, and also to encourage similar efforts, the park, by a special act of the legislature of Ohio, suggested by Prof. M. C. Reed of Hudson, is exempted from taxation and put under special protection of the laws of the State. Thus the first law for the protection of archæologic monuments in our country has been brought about, and it cannot be long before similar laws will be passed by other States.¹ Congress has lately had under favorable consideration a measure for the preservation of several archæologic monuments on the public lands. This petition was prepared by Miss Fletcher and Mrs. Stevenson, acting as a committee appointed by the American Association for the Advancement of Science.² The grand work is thus at last well begun, and we can but believe that it will be continued.

In this connection it should be recalled, with all honor to the pioneers at Marietta acting under the direction of General Rufus Putnam, that in laying out the town several portions of the ancient works were carefully preserved. These efforts, however, were not

wholly respected by a later generation, and the two great embankments, forming an avenue, named by the classical pioneers the Via Sacra, have been destroyed; one having been built upon and partly leveled, and the other made into bricks! Thus the city lost a beautiful avenue leading to the river, deeply regretted now by all its enlightened citizens; and archæologists have been deprived of studying a singular structure over which many have been puzzled as to its purpose. That the present and future citizens will properly guard, as a sacred trust from the old pioneers, the remaining works in the public squares and cemetery, is our most earnest petition.³

As will be seen by reference to the map of the Serpent Mound Park, a winding road leads from the pike up the steep hill to the plateau, which it crosses, and then winds down to the little wood of maples, oaks, and other trees in the southeastern corner of the park. Here, on the grassy hillside, under the spreading oaks and maples, is a delightful resort for picnic parties; and here one may find a refreshing draught of clear cold water from the spring bubbling out of the old devonian rocks. Over the spring a substantial house of stone has been built to keep it clean and pure. A little farther along is a sulphur spring, which flows from the rocks on the opposite side of the little ravine, along which runs a brook over a rocky bed.⁴

Following a graveled path winding up the hill from the picnic grove to the plateau, the first point of archæological interest is reached.

¹ With the hope that similar laws will be passed in other States in which are archæologic monuments that should be preserved, the Ohio law, which was passed March 27, 1888, is here given as one well worthy of imitation.

AN ACT

SUPPLEMENTARY TO SECTION 2732 OF THE REVISED STATUTES OF OHIO.

SECTION 1. *Be it enacted by the General Assembly of the State of Ohio*, That all lands in the State of Ohio on which are situate any prehistoric earthworks, and which have been or may hereafter be purchased by any person, association, or company for the purpose of the preservation of said earthworks, and are not held for profit, but are or shall be dedicated to public uses as prehistoric parks, shall be exempt from taxation.

SECT. 2. The owners of such prehistoric parks may establish all reasonable rules governing access to said parks; and any person willfully violating such rules or injuring said works, or any structure, trees, or plants in said parks, shall be fined in any sum not exceeding fifty dollars, or imprisoned not exceeding sixty days, or both, and shall also be liable to the owners of said parks in a civil action for all damages caused by such person.

SECT. 3. This act shall take effect and be in force from and after its passage.

² Near the close of the session Congress passed an act for the preservation of the ruin everywhere known as the Casa Grande, and this was brought about by

the special interest taken by Mrs. Mary Hemenway of Boston, who for several years past has been deeply interested in, and a most generous supporter of, archæological work in America.

³ The great Cahokia Mound in southern Illinois, the largest mound in the United States, should at once be protected by the State of Illinois, as it already has had a narrow escape from being used for ballast on a railway.

⁴ While provision is thus made for the comfort of transient visitors and picnic parties from the neighboring towns, it is important to add, for the information of visitors from a distance, that accommodations can be had at some of the farmhouses in the vicinity. It is probable that the increasing number of visitors will soon lead to building a summer hotel on the adjoining farm. The fact that over three thousand persons visited the park last summer is evidence of the need of such a house. The park can be reached by the following routes: Starting from Columbus, early in the morning, over the Scioto Valley Railroad, and changing cars at the Portsmouth junction with the Ohio and Northwestern Railroad for Peebles, reaching there about noon, where a suitable conveyance can be had for a drive of seven miles to the park. Or, leaving Columbus in the afternoon, by the Midland Railway, for Blanchester, changing cars there for Hillsborough, and then driving from Hillsborough to the park, about eighteen miles, over a fine pike. From Cincinnati morning trains over both roads run through to Hillsborough and Peebles, and the park can be easily reached in the afternoon by either route.

1, The Oval Embankment in front of the serpent's mouth. In this inclosure is a small mound of stones.
2, The Serpent. 3, A low Artificial Mound near the head of the serpent. 4, A very small Artificial Mound just west of 3. 5, 6, 7, Ancient Excavations, appearing like sink-holes. 8, 19, 20, 21, 22, 23, 24, and in space bordered by 18, 15, 20, 21, are Sites of Ancient Habitations. 9, Burnt Stones on the clay. 10, A recent Indian Grave over two graves. 11, Portions of Three Skeletons in a pile. 12, 13, Skeletons in the clay. 14, Grave with Two Skeletons. 15, Grave with Skeleton, over which was an ash bed. 16, Pieces of a large Clay Pot. 17, Small Burial Mound. 18, Several small Excavations in the clay, filled with dark earth. 19, 24, See above. This Village Site was afterwards found to extend 200 feet east and south. 25, Burnt space under the dark soil extending to the edge of large conical mound. 26, The Conical Mound, a monument over a single body. 27, 28, Cremation Places in the clay under the dark soil. 29, 30, 31, Very Ancient Graves deep in the clay. 32, Small Mound over four ancient graves in the clay.

This is a conical mound nine feet high and seventy feet in diameter (26). Northwest of this, and not far from the serpent, is an old burial-place which was afterwards the site of a village (8, 19), as shown by the ash beds, the many implements in various stages of manufacture, the many thousand chips of flint and other stones foreign to the locality, and the many potsherds and other objects scattered throughout the dark soil. A small mound (17), about a foot high, west of the path leading from the road to the serpent, and a few stones (10) nearer the path, mark the position of the cemetery, and all about there skeletons have been found in the dark soil or in the clay below it.

On the south side of the park road, on one of the projecting points of the plateau, now marked by several piles of stones (27-31) which were taken from around the graves in the clay below the soil, were graves of the first period of occupation. On the knoll west of this, over

which a wild cherry tree now casts its shade, is a low oblong mound (32), a monument over four ancient graves. From this knoll, looking towards the setting sun, there is a grand view of the valley and the hills beyond; and standing on this spot one can readily imagine why it may have been chosen as the burial-place of the honored among a people whose sacred temple was near by.

North of this knoll, on the declivity from the plateau to the cliff, are three circular pits, varying in size; and much of the clay used in building the effigy of the serpent was probably taken from these places.

Following the ridge of the hill northerly to the overhanging rocks, one is forced again to pause and admire the scene before him — the beautiful hill-girt valley with its acres of waving corn; the silvery line of the river with giant sycamores and graceful elms along its banks; and the vistas opening here and there,

where the broader and deeper portions of the river are bordered with dark-green undergrowth, brightened by gleams of rich color.

Turning from this view, and ascending the little knoll behind the ledge, eighty feet from the edge of the cliff is the western end of the oval figure (1) in front of the serpent's jaws. This oval is one hundred and twenty feet long and sixty feet in greatest width, measured from the outer edge of the bank, which is about four feet high and eighteen feet across. Near the center of the inclosed area is a small mound of stones, which was formerly much larger, since it was thrown down over fifty years ago by digging under it in search of supposed hidden treasure, the popular belief which has caused the destruction of many an ancient cairn. Many of the stones show signs of fire, and under the cliff are similar burnt stones which were probably taken from the mound years ago; for I have been informed by an old gentleman, who remembered the stone mound as it was

in his boyhood, that many stones taken from the mound were thrown over the cliff.

This portion of the hill was either leveled off to the clay before the oval work was made, or there was no black soil upon the hill at that time, as none was used in the construction of the embankment, nor left below it. The same is true of the serpent itself. Careful examination of several sections made through the oval and the serpent, as well as laying bare the edge along both sides of the embankments throughout, have shown that both parts of this earthwork were first outlined upon a smooth surface along the ridge of the hill. In some places, particularly at the western end of the oval, and where the serpent approached the steeper portions of the hill, the base was made with stones, as if to prevent its being washed away by heavy rains. In other places clay, often mixed with ashes, was used in making these outlines; and it is evident that the whole structure was most carefully planned, and thoroughly built of lasting material.

The geological formation of the hill shows first the ledge rock, upon which rests the decayed grayish rock forming the so-called marl of the region, the upper portion of which has by decomposition become a grayish clay. Over this lies the yellow clay of the region, filling in all irregularities, and varying in thickness from one to six feet. Upon this rests the dark soil of recent formation, from five inches to nearly two feet in thickness in different parts of the park. It is necessary to have this formation constantly in mind, as we must, to a certain extent, rely upon it in determining the antiquity of the works and burial-places.

Upon removing the sod within the oval the dark soil in the central portion was found to be nearly a foot in depth, where it must have formed after the oval work was built. How many centuries are required for the formation of a foot of vegetable mold we do not know; but here, on the hard gray clay forming the floor of the oval, was about the same depth of soil as on the level ground near the tail of the serpent, where it has been forming ever since vegetation began to grow upon the spot. The same results were obtained on removing the soil from the triangular space between the serpent's jaws; and that there was about the same amount of soil on the embankments is shown by the fact that the several plowings had not disturbed the underlying clay of which the embankments were constructed. The accompanying section through the western end of the oval illustrates this point.

Nine feet from the eastern end of the oval, and partly inclosing it, is a crescent-shaped bank, seventeen feet wide. From the extremities of this crescent, which are 75 feet apart, begin the

jaws of the serpent, formed by banks 17 feet wide and 61 and 56 feet, respectively, in length, measured on the inside from the point of union with the crescent to their point of meeting, 47 feet from the convex or eastern edge of the crescent. We must here notice that the open jaws are shown as if the serpent's head was turned upon its right side, and the crescent embankment seems to have been designed to express this by uniting the open jaws across the mouth, indicated by the triangular space. This design was also carried out by making the northern or upper jaw the longer of the two. The head of the serpent across the point of union of the jaws is thirty feet wide and five feet high. From this point the neck extends eastward more than one hundred feet, with a slight curve to the north. Then begins what may be called the body of the serpent, making a graceful curve to the south, then winding to the east and north, then again to the south, and westward down the declivity of the central portion of the hill, where another graceful convolution is made up the opposite ascent to nearly the same level as the head; here it folds round in another full convolution, and the tail follows with a long stretch to the southwest, terminating in a triple coil.

The end of the tail points across the deep gully in the hillside to the western end of the oval, which is 496 feet distant in an air-line, but 1348 feet if measured from the western end of the oval to the neck of the serpent, and then along the dorsal ridge to the tip of the tail, thus following all the curves. Measured from the tip of the upper jaw to the end of the tail, the serpent itself is 1254 feet in length. The average width of the body of the serpent is about twenty feet, and its height along the head and body is from four to five feet. From

SECTION THROUGH WEST END OF BANK OF OVAL IN FRONT OF SERPENT MOUND.

the beginning of the tail it gradually decreases in width and height until it terminates in a bank about a foot high and nearly two feet wide.

The graceful curves throughout the whole length of this singular effigy give it a strange, lifelike appearance; as if a huge serpent, slowly uncoiling itself and creeping silently and stealthily along the crest of the hill, was about to seize the oval within its extended jaws. Late in the afternoon, when the lights and shades are brought out in strong relief, the ef-

fect is indeed strange and weird; and this effect is heightened still more when the full moon lights up the scene, and the stillness is broken only by the "whoo-whoo, hoo-hoo" of the unseen bird of night.

That such a work, so carefully designed, and constructed under such difficulties along this narrow ridge terminating in the high rough cliff, was planned and built under some powerful influence, we can but believe. And what other than a religious motive can be conceived? Have we not here the evidence of the former existence of that ancient faith, which, rising probably in the East, ages before historic time, held millions of people under its terrible sway; and, spreading over Asia, Africa, and Europe, has not yet been wholly supplanted, in India and Africa, by later faiths?¹

That the serpent was prominent in the religious faiths of the Americans is beyond question, and that, to a certain extent, in combination with phallic and solar worship, it extended from Central America to Peru and Mexico, cannot be doubted, whatever its origin. Its existence in Yucatan is shown, as in Cambodia, by sculptures on the ruined buildings which can only be properly designated as temples. We know from history and art that this form of worship existed in Mexico down to the time of the Spanish invasion and conquest, and that it still survives in the rites of the Zūnis and Moquis, and probably other of the Pueblo tribes.

To this southwestern region, with its many Asiatic features of art and faith, we are con-

stantly forced by our investigations as we look for the source of the builders of the older works of the Ohio Valley. With these considerations in mind, and with the knowledge that structures similar to this in Ohio existed in the Old World,² where the serpent and other early faiths had their greatest development, will it be forcing the facts to argue—unless all religious symbolism is merely coincident, vague, and meaningless, which seems an absurd position to hold—that in the oval embankment, with its central pile of burnt stones, in combination with the serpent, we have the three symbols everywhere regarded in the Old World as emblems of those primitive faiths? Here we find the *linga-in-yoni* of India, or the reciprocal principles of nature guarded by the serpent; or life, power, knowledge, and eternity. Moreover, its position, east and west, indicates the nourishing source of fertility—the great sun-god whose first rays fall upon the altar of stones in the center of the oval. So that here we have associated the several symbols which in Asia would be accepted without question as showing the place to be a phallo-solar shrine combined with the serpent faith. Its very position³ on the high cliff terminating in the rough overhanging rocks, washed by the spring torrents, and near the three forks of the river,⁴ is to be considered when comparisons are made. This combination of natural features probably could not be found again in any part of the great route along which the people must have journeyed from the Mexican Gulf. Is this all to be taken as mere coincidence in the development of a

¹ Forlong, in his carefully elaborated volumes and wonderful compendium of facts relating to the faiths of man,* shows the existence of serpent worship in India and Africa to this day; and the survival, in part, of its symbols, together with those of other primitive religious faiths. Fergusson, in his critical and widely known volume,† also states that serpent worship still holds an important place in the religion of India. He also speaks of its great development in Cambodia, at the time when the country was conquered by the Siamese in the last half of the fourteenth century, and Buddhism superseded serpent worship. Fergusson thinks this latter faith was there introduced in the fourth century, and resulted "in some of the most wonderful temples which the world ever saw, and in the most remarkable development of pure serpent worship anywhere to be found." The greatest of these temples, discovered in the jungle only thirty years ago, is that of Nakhon Vat, which is "600 feet square at the base, and rises to a height of 180 feet in the center, of which every part is covered with carvings in stone, generally beautiful in design, and always admirably adapted to their situation, and to tell the story they were meant to convey. . . . Every angle of every roof is adorned

with a grim seven-headed serpent with a magnificent crest of what is apparently intended for feathers, and every cornice of every entablature is adorned with a continuous row of these seven-headed deities, but without crests. The former may be counted by hundreds, the latter by thousands. But it is not only there; every balustrade, every ridge, almost every feature of the building, bears the same impress."

² Forlong quotes, Vol. I., p. 287: "Mauretania had mighty dragon temples, avenues, and 'fields' of this faith 'over whose backs' grass was most abundant. Taxiles showed Alexander 'a serpent of five acres' in the Punjab. Strabo describes two somewhat similar ones, and Posidonius saw one in the plains of Macra, in Syria, such 'that two persons on horseback, when they rode on opposite sides, could not see one another; each scale was as big as a shield.'"

³ Forlong, on p. 255, refers to this: "As usual, we must carefully study the *topography* of the shrine; for it is always this, and not signs or miracles, from or by the gods, which *first* attracts wise priests. Fitting scenic effect is necessary towards the success of every drama we intend to place before the public, more especially if we wish to inspire an enduring reverence, awe, and worship, with tragic interludes."

⁴ In regard to this, Forlong, referring to the Ohio serpent, p. 290, writes: "A spot overlooking three streams being even more sacred than that which looks on to a hill with three cones, as does the serpent of Loch Nell. Three rivers form a Tri-Moorti of 'awful and sublime import.'"

* "Rivers of Life; or, Sources and Streams of the Faiths of Man in all Lands; showing the Evolutions of Faiths, from the Rudest Symbolisms to the Later Spiritual Developments." By Major General J. S. R. Forlong. London, 1883. 2 vols. 4to, and chart.

† "Tree and Serpent Worship; or, Illustrations of Mythology and Art in India in the First and Fourth Centuries after Christ," etc. 2d edition. London, 1873. 1 vol. 4to, with many photographic illustrations.

faith in America and in the Old World? There seems to be too much here to admit of such a theory; and when other facts, in other lines, point in the same direction, it is playing false with our reason to be too skeptical. Agreements, nay, identities, would then mean nothing in science, and comparative studies would be useless. Fergusson, in his "Tree and Serpent Worship," mentions the existence of serpent worship on some of the Pacific islands, and refers to its possible transmission across the Pacific to America, and says if it is proved "that this worship is indigenous in the New World, we are thrown back on the doctrine that human nature is alike everywhere, and that man in like circumstances and with a like degree of civilization does always the same things, and elaborates the same beliefs. It may be so, but I confess it appears to me that at present the evidence preponderates the other way" (p. 39). When this careful author thus expressed his views, he was not acquainted with the details now pointed out in the combinations of the Ohio serpent shrine.

In 1871 Mr. Phené made known his discovery of an interesting mound in Argyleshire, Scotland, a figure and brief description of which is given by Miss Gordon Cumming in "Good Words" for March, 1872. This work has so much in common with the Ohio serpent that Miss Cumming's illustration is here copied

THE SERPENT OF LOCH NELL. (REPRODUCED BY PERMISSION OF ISBISTER & CO., LIMITED, LONDON.)

for comparison, and I give a brief abstract of her description:

The mound is situated upon a grassy plain. The tail of the serpent rests near the shore of Loch Nell, and the mound gradually rises seventeen to twenty feet in height and is continued for three hundred feet, "forming a double curve like a huge letter S, and wonderfully perfect in anatomical outline. This we perceived the more perfectly on reaching the head, which lies at the western end. . . . The head forms a circular cairn, on which, at the time of Mr. Phené's first visit (several years previous), there still remained some trace of an altar (shown in the figure), which has since wholly disappeared, thanks to the cattle and herd boys." Mr. Phené excavated the circular cairn, or circle of stones, form-

ing the head, and although it had been previously disturbed, he found "three large stones forming a megalithic chamber, which contained burnt bones, charcoal, and burnt hazel-nuts," and an implement of flint was also found during the excavation. "On removing the peat-moss and heather from the ridge of the serpent's back, it was found that the whole length of the spine was carefully constructed, with regularly and symmetrically placed stones, at such an angle as to throw off the rain. . . . The spine is, in fact, a long narrow causeway made of large stones, set like the vertebræ of some huge animal. They form a ridge, sloping off at each side, which is continued downward with an arrangement of smaller stones suggestive of ribs. The mound has been formed in such a position that the worshipers, standing at the altar, would naturally look eastward, directly along the whole length of the great reptile, and across the dark lake to the triple peaks of Ben Cruachan. This position must have been carefully selected, as from no other point are the three peaks visible."

General Forlong, in commenting on this, says:

Here, then, we have an earth-formed snake, emerging in the usual manner from dark water, at the base, as it were, of a triple cone,—Scotland's Mount Hermon,—just as we so frequently meet snakes and their shrines in the East.

Is there not something more than mere coincidence in the resemblances between the Loch Nell and the Ohio serpent, to say nothing of the topography of their respective situations? Each has the head pointing west, and each terminates with a circular inclosure, containing an altar, from which, looking along the most prominent portion of the serpent, the rising sun may be seen. If the serpent of Scotland is the symbol of an ancient faith, surely that of Ohio is the same.

Why lies this mighty serpent here,
Let him who knoweth tell.

Why lies it here?—not here alone,
But far to east and west
The wonder-working snake is known,
A mighty god confessed.¹

On a preceding page brief mention has been made of mounds and burial-places on the plateau which spreads to the southeast from the coiled tail of the serpent. It is now essential to refer to the discoveries made during the exploration of these places; where, by the aid of the pick and the spade, much of the history of the past has been revealed. Here, under a mound, there, deep down in the clay, and here, again, in the recent soil, were the several pages of the book which we must now read. The language of this book is that of stones, bones, and ashes; and it will tell us anew of the great drama of life.

¹ Professor Stuart Blackie, in "Good Words," March, 1872.

BURIAL-PLACE UNDER VILLAGE SITE, SERPENT MOUND PARK; LARGE CONICAL BURIAL-MOUND ON RIGHT IN MIDDLE DISTANCE. THE STAKE SHOWS POSITION OF SKELETON IN CLAY.

It is said that fifty years ago that part of the plateau which is near the serpent was a foot or two above the level of the rest. Constant cultivation of the soil, and the washing away of the loose earth, has now reduced this portion to the common level, but it is evident from the difference in the color and character of the soil that this part of the plateau has been the dwelling-place of man. Beginning at one edge of this darker soil, it, and the clay below, for a foot in depth, was examined inch by inch, as the men worked forward in a line, throwing the earth behind them. Evidence was thus obtained of the former existence of habitations, shown by the burnt places and ash beds marking the sites of dwellings. In these ash beds and in the soil around them were thousands of chips and flakes of flint and other stones, as well as rough pieces of jasper, quartz, and other rocks, just as they were brought from the gravel bed of the opposite hill, or from other places, to be here worked into implements of various kinds. About the old hearths, and here and there in the earth, hundreds of finished implements were found—hammers which were simple nodules or pebbles of hard stone with abraded edges, or pebbles with pits pecked upon the sides; chisel-shaped implements with a sharp-cutting edge; axes of various sizes; knives of many shapes, some made of long flakes of flint or chalcedony and others beautifully chipped from various kinds of stone, some long and slender and others like long spear-points, which, in fact, they may have been; chipped drills and perforators; and many small chipped points of

different sizes and shapes, some of which were arrow-heads and others the blades of knives or dagger-like implements. Several ornaments made of stone were also found, and in the ashes were bones of deer and of birds, which had been sharpened to a point. Everywhere were pieces of rude pottery, the fragments of cooking and other domestic utensils. In the ash beds were also many bones of fish, turtles, birds, and mammals, the remains of animals used for food. All these things showed beyond question that here had been an ancient village; and although the land had long been subjected to the white man's plow, so that everything near the surface had been thrown out of place, it was still evident that the ash beds and objects found on and in the clay, below the twelve to fifteen inches of dark soil, were older than those near the surface. As our explorations were continued we discovered that here had been dwellings and burials of different times. Some of the graves were only deep enough to reach the clay, while others were in the clay; and over one, at least, a small mound had been raised, of which the plow had left only the base undisturbed.¹ In one place a grave had been made to a slight depth below the soil, and here had been placed portions of the skeletons of three persons. The skulls, with a large part of the long bones and some of the smaller bones of the three skeletons, had apparently been brought to the spot in a bundle and placed in this grave. These bones, while evi-

¹ An elderly gentleman has informed me that he remembers noticing in his youth many small mounds in the woods then covering this spot.

dently of considerable antiquity, were far more recent than several other extended skeletons near them in the clay. Does not this burial of bones show that the spot was revered, either as the home of ancestors, or from its vicinity to the sacred shrine, about which traditions may well have been preserved long after the immediate descendants of its builders had disappeared from the region? Not far from this pile of bones was a grave near the surface, about which stones had been placed on edge. This was in every way like the unquestion-

and was about nine feet long and five wide. A pavement of flat stones was placed over the bottom, and on them, at the south side, compressed into a mass of ashes and charcoal not over an inch in thickness, were the fragments of a skeleton. The pieces of skull found at the southeastern corner of the grave were twice the usual thickness. Over these remains were ninety-six large stones, brought from the creek; and on these stones were found portions of another skeleton. In this instance the body was extended along the eastern edge of the grave,

RECENT INDIAN GRAVE, SHOWING POSITION OF BURIAL OVER AN ANCIENT GRAVE MARKED BY THE STONES.

ably recent Indian graves on the surrounding hills, which are referred to in the note below.¹ This grave was so near the surface that the side stones had been thrown down by the plow, which had made one furrow directly through the skeleton. On the ribs of this skeleton was the shell of a box-turtle, and, near by, a bone from the foot of a deer. The grave had been made, all unwittingly, partly over an ancient grave of particular interest. This older grave had been made about five feet deep in the clay,

with the head to the southwest. Several stones were found over these fragments of bones, and four inches above the stone covering the skull was the bottom of the central portion of the most recent grave, in which the body had been placed with the head to the east. I mention these positions to show that there was no uniformity as to the position in which the bodies were placed. This was the case with all the burials about here. It may be that some peoples and tribes have particular customs in regard

¹ A hundred years ago there were several settlements of Indians in this part of Ohio, and so recently as the year 1800, and for several years after, a small band of Indians were living on the bottom-land near the forks of the river on the opposite side, and not far from the serpent cliff. The sites of the wigwams were pointed out to me by Mr. Hewes, whose grandfather settled on the place and had much to do with the Indians who were living there. On many of the hilltops about the valley I have seen groups of the graves of these recent Indians. The graves are only a foot or two in depth, and wide and long enough for the body to be placed, at full length, between rough stones set on edge around the body and projecting above the ground. Occasionally these graves are covered with flat stones. So far as my experience goes, very few objects are found with the skeletons in such graves.

These recent graves, found in Kentucky, Ohio, and to the westward, have often been described and discussed as having the same character as the carefully constructed stone graves of the Cumberland Valley in Tennessee. But there is in reality only a very general resemblance between them, and neither by their structure nor by their contents do they indicate one and the same people, but on the contrary they show marked differences; and the great antiquity of the Tennessee stone graves as a whole is in marked contrast with these recent graves on the hills along Brush Creek Valley. On the points of the hills are also many stone mounds, with an occasional earth mound, which are monuments over graves of far more recent times than the building of the serpent and other great earth structures of the Ohio Valley.

to this point, but our explorations have shown that no uniform rule was followed, in ancient times, in many parts of America.¹

Pages could be filled with instructive details relating to this burial-place and village site, with its fireplaces and graves, and little refuse piles containing animal bones and various objects upon the clay; showing that at one time either the dark soil had been cleared away and fires built upon the clay, or, as I consider by far the more probable, only a few inches of soil had formed at that period.

We must now turn our attention to the conical mound (26 on map), on the southeastern portion of the plateau, which is shown in a preceding illustration. This proved to be a monument over the body of a man who was buried in connection with important ceremonies.

First an area seventy by seventy-one feet in diameter was cleared of all the dark soil, and the clay was also removed for several inches

ally placed in them, shows that they were made for a purpose. It was evident from their character that they were not places where posts had stood, forming part of a wooden structure.¹ Over this cleared area, and of course covering all these holes and the trench, clay was placed, forming a level platform eighteen inches high. In the central portion of this platform, covering a space thirty by thirty-five feet in diameter, a fire had been kindled and kept burning until a bed of ashes a few inches in thickness was made, to which may have been added ashes brought from other places, perhaps in great part from the burnt area extending for nearly one hundred feet north of the mound as indicated by the dotted lines at 25 on the map. In this ash bed were found many small bits of pottery, pieces of burnt bone, and many stone chips; several broken stone implements and about a dozen perfect ones; also pieces of the shells of fresh-water

SKELETON ON ASH BED AT BOTTOM OF CONICAL MOUND.

in depth, making a clear, level floor. Eleven feet northwest of the center a trench was dug, 14 inches deep, 2 feet wide, and 5 feet long, and again filled with loose clay, in which were a few small stones and several broken bones of animals. On the south side, from 6 to 11 feet from the center, and from 1 to 5 feet apart, were four small holes in the clay, and 14 inches southeast of the center was another. Each contained stones or a few animal bones or ashes. On the north side, from two to six feet from the center, were four more of these holes, in which were small stones and animal bones. These holes varied from a few inches to over a foot in depth, and from two feet to nearly seven feet in diameter. Their position, and the fact that they each contained something intention-

clams; all of which is suggestive of scraping up ashes from various hearths and depositing all upon the heap. That a large part of the ashes was made on the spot was evident from the burnt clay below, and from the several continuous masses of charcoal, the remains of logs from two to four inches in diameter. When this ceremony was finished and enough ashes for the desired purpose had been obtained, the body of an adult man, nearly six feet tall, was placed, with the head to the east, at full length upon the hot ashes, and at once covered with clay, smothering the still smoldering logs and changing the embers to charcoal. Objects of a lasting nature do not seem to have been placed with the body, unless some of the chipped flint points found near

¹ I have recently explored a burial-place of the Massachusetts Indians at Winthrop, near Boston. Of eight skeletons found here all had their heads to the south, and of five adults and one child all but one faced the east, one adult facing the west. Two infants were in the same grave, resting upon their backs, between the

skeletons of a man and a woman, placed on their sides, facing the east.

² Post-holes, regularly placed, are often found under burial-mounds, but any one familiar with such holes would not mistake these strange little pits for them.

SECTION OF CONICAL MOUND, SHOWING INTRUSIVE BURIALS.

it in the ashes may be so considered. It may be asked if this was not an unsuccessful case of cremation, but I think that question may be answered in the negative; for while cremation was often practiced, as I have found on other occasions, it was by different methods, and the ashes and calcined bones were afterwards gathered up for burial, or buried in a peculiar manner at the place of burning.

Several peculiarities of this skeleton are worthy of notice. It was that of a well-developed man of ordinary size. The skull was crushed by the weight of the earth above, as shown in the photograph here reproduced. While this man was fully grown and probably about twenty-five or thirty years of age, he never had any wisdom teeth, and a search in the maxillary bone of one side showed that there was no wisdom tooth forming in the jaw.¹ With this exception he had a fine set of teeth, and still embedded in the premaxillary bone is a partly formed left incisor tooth. No corresponding formation can be seen on the opposite side of the suture, and this is probably a supernumerary tooth, although the small size of the lateral incisors is suggestive of their being persistent first teeth. As is often the case in skulls of this race, the crowns of the incisors are dis-

tinctly folded. All the sutures of this brachycephalic skull are unusually open and denticulated. Along the suture uniting the occipital bone with the posterior part of the two parietal bones there are several intercalated pieces, or "Wormian bones." Such bones are more common in the American brachycephalic skulls than in the dolichocephalic, and in this skull they are so numerous as to cause the division of the upper portion of the occipital bone into several small pieces.² At the time of birth the frontal bone in man is still in two pieces, which gradually close by a central suture. Normally this frontal suture is obliterated in a few years and the frontal becomes a single bone. Occasionally this suture persists through life, and such crania are called metopic. This occurs more often in the white race than in any other, and seldom in the lower races. It is therefore of interest to note the existence of this anatomical feature in an individual at whose burial so considerable a ceremony took place, and over whose body such an imposing monument was erected.

After the immediate covering of the body with clay, the mound was raised, a symmetrical conical heap of clay, to the height of ten or twelve feet.³ Some time subsequent to the

¹ The late development of the third molars, or "wisdom teeth," in the ancient brachycephalic skulls of Ohio seems to be a decidedly marked characteristic of this people, and in this instance there was none forming. It has been remarked that among the Hindus a large proportion never have wisdom teeth.

² The frequent occurrence of these subdivisions of the occipital bone in the short-headed race of the south is a marked characteristic of the race. It was long ago pointed out that in the skulls of the ancient Peruvians (short-heads) there was often a suture across the upper portion of the occipital bone, thus

leaving a triangular bone between the parietals, to which the name "Inca bone" was given. The large number of skulls of brachycephalic Americans now brought together in the Peabody Museum shows that this tendency to subdivision of the occipital is common to the race, and occurs in the short skulls from Ohio as well as in those of Peru and all the intermediate regions.

³ Previously to the time of my first visit the mound had been plowed and cultivated for several years, thus reducing its highest point to nine feet, to which height I restored the mound after the exploration.

STONE IMPLEMENTS (HALF SIZE), FROM DIFFERENT PARTS OF CONICAL MOUND.
(NOW IN THE PEABODY MUSEUM.)

building of the mound, and after the clay had settled into a compact mass, graves were dug upon its sides and top, and nine burials had taken place. Some of the intrusive graves were so near the surface that in plowing over the mound the bones had been disturbed, while others were much deeper. One skeleton was found on the eastern side of the mound, and four feet from the exterior. As shown in the illustration, the skeleton was extended at full length nearly north and south. At a little greater depth from the top of the mound another skeleton was found, extended nearly east and west. Woodchucks had made their burrows in this part of the mound and had thrown out portions of the skull and other parts of this skeleton, among the bones of which they had made their nest. The stones seen in the illustration, near the surface of the mound, mark another grave over which the four stones had been placed. The bones in this and in the six other graves near the surface of the mound, were much decayed, and only fragments of the skeletons could be traced. In one instance

only was anything found with the skeleton, and that was a fine stone hatchet resting, with its edge outward, on the bones of the left forearm, as if the handle had been placed along the arm and held in the hand. This implement is shown, with others from the mound, in the illustration above, all of which are represented of half size.

During the exploration of the mound a number of stone implements were found, principally near the bottom on a level with the ash bed, but several chipped points, or "arrow-heads," were also discovered at various depths in the clay, as if they had been lost during the erection of the mound. Among the objects of special interest found in or near the ash bed, and thus associated with the first burial, were a hemisphere of hematite, a plummet-shaped implement, a small hatchet, and several perfect points chipped from flint. Two finely finished and polished stone axes with straight backs, and grooves around them for holding the withes by which they were fastened to handles, were also found at the bottom of the mound. A

HEMATITE HEMISPHERE, GROOVED STONE IMPLEMENT, HATCHET, AND FLINT KNIVES (HALF SIZE), FOUND ON OR NEAR ASH BED IN CONICAL MOUND. (NOW IN THE PEABODY MUSEUM.)

few points made of splinters of bone were found in the ashes; and near the edge of the ashes, but not in it, was a plate of copper, slightly irregular in outline, nine and a half inches long, three and a half to four inches wide, and one-eighth to nearly one-quarter of an inch thick, unquestionably hammered out of a mass of native copper.¹

At the southwestern portion of the plateau, on a knoll now shaded by a wild cherry tree, and to which reference has previously been made (32 of map), there is now a small low mound which has recently been restored, having been nearly plowed down years ago. Its site was noticed by Dr. Metz while examining the plateau with me, three years ago. The year

In leveling the mound and plowing over the spot many of these stones had been turned out and thrown down the hill; but a few still remained, near which we started the preliminary trench. About a foot below the natural surface of the clay we found other stones, irregularly placed over an area about seven feet long east and west and four feet wide north and south, resting upon a bed of ashes nearly a foot thick; and under this ash bed were three more irregular groups, which proved to be graves—one under the eastern corner of the ash bed, one under the southeastern, and the other under the northwestern portion. In each of these graves were the remains of human skeletons, lying in the clay, and covered with

COPPERPLATE AND STONE AXES (HALF SIZE), FROM BOTTOM OF CONICAL MOUND. (NOW IN THE PEABODY MUSEUM.)

following I explored the place and here found the first burials, which have an antiquity as great as that of the serpent itself, and we have every reason to believe that the bodies buried at this spot were of the people who worshiped at the serpent shrine.

On the clay of the knoll a number of large stones had been placed, and over these had been raised a small mound, oblong in shape, and probably not over two or three feet high.

¹ Similar plates, but having two holes, probably for suspending them from the neck, have been found in other mounds and with skeletons. In one case we found such a plate lying upon the breast-bone of a skeleton in a mound in the Scioto Valley. In several instances we have found them covered on one side with cloth, which was preserved by the copper salts, thus enabling us to study the method of weaving the cloth made from twisted vegetable fiber. One of these plates is figured in the "Eighteenth Report" of the Peabody Museum, Cambridge, 1886. On this plate a lock of hair has been preserved by the copper. I have recently seen a remarkable instance of the preservation of tissues by the salts of copper, in the skull of a Massachusetts Indian, found at Winthrop, and given to the Museum by Mr. Charles A. Hammond of Lynn. This Indian had been buried with a broad thin plate of copper fastened as an ornament over the forehead. Over this

ashes containing considerable charcoal; and here again, below these graves, were half a dozen boulders, from one to two feet in diameter, and around them the edges of other stones, some of which were rounded boulders and others pieces of ledge rock, about four inches thick and a foot or two long, which marked another grave seven feet long and two feet wide. Here, too, were found the remains of a skeleton, extending from the southeast to

had been placed a piece of woven native cloth, over which at the time of burial a mat of braided cedar bark had been laid. The action of the copper, which was very much oxidized and decomposed, had preserved portions of each of these fabrics, as well as the hair and scalp on one side of the head, and the skin of a large part of the face. The bones below, even including half of the under jaw, were colored green by the carbonate of copper that had penetrated through the cells to the inner table of the skull, which was also colored green; and portions of the brain, or at least its surrounding tissues, now exist as a hard dark mass in the cavity of the skull. We have historical evidence that this Indian must have been buried as early as 1650; but probably it was before that time, and in its present condition there is every reason to believe that the skull would have lasted for centuries to come.

ANCIENT GRAVES UNDER SMALL MOUND,
NEAR CHERRY TREE, WITH FRAGMENTS
OF ARM-BONES, SHOWING POSITION OF ARROW-
HEAD AND DAGGER-POINT.

the northwest, and resting upon flat stones. This grave, of course, contained the first burial of the four that had taken place at this spot, and was made two feet below the bottom of the uppermost layer of stones covering all the graves. The great weight from above had crushed the skull and other portions of the skeleton, and the fragments were firmly embedded in the hard yellow clay which had silted into the grave, mixed with ashes which had been thrown over the body. This mass had become so hard and compact that it seemed more like taking fossils from a clay rock than human bones from a grave. The clay immediately under the bottom stones was filled with bog iron, which had been deposited by water percolating among the stones, and the iron had also penetrated the bones. Several flint-flakes and a rude flint implement

gestive of having been in the flesh at that time. A piece of flint which had been slightly chipped to a rude point was found in the clay near the decayed ribs, but this seems too rude an object to be called a weapon, and was probably placed in the grave. No other objects of any kind were found in this grave or in either of the other two. The fragments of bones, in all the graves, showed that all four skeletons were those of fully grown persons, and probably all men. With the knowledge obtained from the exploration of thousands of graves, under many and varied conditions of burial, in various parts of the country, during nearly a quarter of a century of active field-work, I am able to state that all the conditions relating to these graves, and to those next to be described, are confirmatory of their great antiquity; indeed, I have seldom found more conclusive comparative

point extending southward from the main plateau. The underlying rock of this knoll is probably a continuation of the limestone of which the outcrop is seen along the border of Brush Creek. On the southern slope of this point are many boulders derived from the breaking up of the devonian rock, and over them is a deposit of yellow clay like that covering the whole plateau. Over the clay at this point there are from six to ten inches of dark soil. Upon removing this soil five irregular groups of stones were found (27-31 on map); the three to the west covered graves, and the two to the east were ancient fireplaces. It is evident that these stones were placed upon the surface of the clay, and it seems probable that the loose and dark soil had formed over them as a natural deposit. The fireplace farthest east was formed by five small boulders in a line, four feet long on the southern side; and two feet from the eastern end of this row, three other stones, placed side by side, made a row nearly two feet long; between the two rows was a single small stone at the eastern end. All the stones and the clay between them showed signs of burning. In the crevices between these stones some ashes had been left when the rest was scraped up, and there were a few pieces of burnt bones, splinters of flint implements, flint chips, a broken hemisphere of hematite, several tubes or handles made of the leg-bones of deer, and a chisel-shaped implement carved from a piece of deer's antler, which, from being burnt, had the appearance of a piece of cannon coal. An excavation was made to the boulders below, but no signs of burial were found.

The second fireplace was four feet southwest of the first, and was made of much larger stones, ten in number, which rested directly upon the boulders, from among which the stones had evidently been taken. There was no regularity in their arrangement, and the fire had been built upon them. Among them a small amount of charcoal, made by burning twigs and grass, was scraped up, but the place had evidently been carefully cleared of its ashes.

About four feet north of the west end of this fireplace was the first grave, which was nearly three feet deep, and had been dug down to the boulders, between which a few stones had been placed to make an even bottom, upon which the body had been extended at full length, with the head at the eastern end of the grave.

The bones were much decayed, and the portions preserved were deeply stained with iron. The skull was crushed, but so firmly impacted in clay that nearly all of it was secured in small pieces. There were neither ashes nor implements nor objects of any kind in the grave.

Sixteen feet westward was a grave which proved to be of great interest. The twenty to thirty stones marking this grave were removed, and two feet below them, covered with clay, were two masses of burnt bones, ashes, charcoal, pieces of many points made from the leg-bones of deer, a chisel-shaped implement made of antler, and pieces of others, a number of chipped flint implements in various forms of knives, long points, and arrow-heads. One of the masses of burnt material was near the center of the grave and the other was at the southern end. Under them were two skeletons extended at full length side by side, with the shoulders against the hard clay at the northeastern edge of the grave. Remains of the clavicles and of the scapula bones were in place, but not a trace of the upper cervical vertebræ or of the skulls could be found, although for hours a careful search was made in all parts of the grave, and for two feet beyond all signs of former disturbance of the clay; and it was evident beyond all question that these two bodies had been decapitated before they were placed in the grave. These skeletons were lying in the clay eight inches above the boulders. The portions of the bones remaining, while thoroughly impregnated with iron, were much decayed, and only the more solid portions of the arm and leg bones held together, though the outlines or casts of nearly all the bones could be traced in the clay as it was carefully removed.

The largest number of objects I have ever seen in a single grave was found with these skeletons. Lying on the left shoulder and chest of the skeleton on the east side of the grave was a long point, beautifully chipped from a blue flint, and under this were five flint knives, two chipped pieces of flint, and a small piece of sandstone with several grooves, which was evidently a stone used for sharpening points of bone and other implements. Near the outside of the left knee of this skeleton were twenty-three implements chipped from flint,—knives, points, etc.,—and pieces of several long bone points made from the leg-bones of deer. A few inches outside of these were two large stone celts or hatchets, one of which was made from a

TUBE OR HANDLE (LITTLE LESS THAN HALF SIZE) MADE FROM LEG-BONE OF A DEER, FROM ASHES IN CREMATION PLACE. (NOW IN PEABODY MUSEUM.)

STONE HATCHET AND KNIVES OF FLINT (LESS THAN HALF SIZE) FOUND NEAR LEFT KNEE OF SKELETON. (NOW IN THE PEABODY MUSEUM.)

green slaty rock, which had decomposed and split into several pieces since it was placed in the grave, as was shown by the fact that all the particles were in place. Several of these knives and one of the hatchets are shown, of a little less than half size, in the illustration above. Between the knees was another flint point, and near the left foot was a mass of red ocher in which was a finely made flint point and a point of bone. These points or knives are shown, of one-third size, as *a* and *b* of the illustration on page 884.

On the outside of the right hip and along the leg of the other skeleton were twelve flint knives and points and a long bone point. On the inside of the right humerus of this skeleton were another flint knife and three flint flakes; and at the lower end of the humerus, with the flat surface resting against the bone, was an ornament cut out of a crystal of galena (lead). This ornament has two holes through it, evidently for the purpose of fastening it to some object or to the person. Similar ornaments of galena and of stone have been found in other graves and in mounds. Those of galena are very rare; probably not a dozen are known, this one being the third placed in the Peabody Museum.

The burnt material in this grave is of the same character as that found on the first fireplace, and among the burnt bones are many fragments which can be identified as human. Not only this, but there was also found in the grave another piece of the implement made of antler. This has a jagged edge exactly fitting the corresponding edge of the piece from the fireplace, and it cannot be questioned that they originally formed a single piece of a chisel-like implement. We therefore have reason to believe that at the time when the two headless bodies were buried the body of another person was burnt near by, and that the ashes containing the burnt bones, and various objects burnt with the body, were placed over the two individuals in the grave, partly over the legs and feet of one skeleton and partly over the right hip and leg of the other skeleton. Be-

sides the fragment of the implement which matches the other piece from the fireplace, the burnt mass in the grave contained a piece of a sharpening stone, forty flint flakes and chipped pieces of stone, eighteen chipped implements of various kinds, several of which were splintered by the heat, a number of pieces of implements made of deer antler, the bones of animals, and four natural pieces of lead ore (galena). Resting on the burnt mass, but evidently put in afterwards, was a little red ocher in which was a much decayed point made from the metacarpal bone of a deer; and near by were the remains of several other bone implements of the same character, and a chisel-like implement made of antler. In the clay filling the grave above the ashes were two chipped implements of flint.

Was this ceremony, and the depositing so many objects in the grave, a sacrifice and propitiatory offering to the two individuals, who perhaps had been beheaded

IMPLEMENT MADE OF ANTLER (LITTLE LESS THAN HALF SIZE) FROM GRAVE; THE SMALL PIECE FROM THE ASHES OF CREMATION PLACE. (NOW IN PEABODY MUSEUM.)

by their enemies after some valiant deed,¹ and whose bodies were afterward recovered and buried with extraordinary rites?

Six feet farther to the west stones were scattered here and there on the surface of the clay, over an area of about four by eight feet, partly covering three closely adjoining graves, all of which had been dug down to the large boulders, a depth of three feet. At the bottom of one of these graves were several large flat stones resting on the boulders. The body had then been placed at full length in the grave, with the head at the eastern end; ashes containing considerable charcoal had been placed over the body, and over this about a foot of clay. The grave was then filled with stones, some measuring a foot or more in diameter, but the greater part much smaller. Two rows of stones, about seven feet long and two feet apart, marked the grave on the surface. There was nothing in the grave except the bones of the skeleton, very much decayed, the fragments of which were impregnated with iron. A stone had been placed over the head, which, while it had crushed the skull into many pieces, had so protected the cranial bones that they had become thoroughly charged with iron and were thus preserved.

Adjoining this grave, to the south, was another, the bottom of which was clay, resting on the boulders. In this instance the body had been covered with clay. The enamel of a full set of teeth lay in the clay in their natural position, even to the wisdom teeth of the upper jaw, which were slightly above the line of the others, showing that they were just cutting through the bone at the time of death. The outline of the skull and of many of the bones of the skeleton could be traced in the clay, but only as minute particles of bone, the cells of which were filled with iron. Nothing more was found in this very ancient grave.

West of this, and at the same depth, was another grave, about four feet long, in which were found only iron-stained fragments of a tibia and fibula and several of the bones of a foot. No other fragment of the skeleton could be discovered, not even bone particles in the clay; but just beyond these fragments was a mass of light gray ashes containing many small pieces of calcined bones, which proved to be human by the identification of the crown of one molar tooth, a small piece of occipital bone, and two small pieces of the under jaw. With these burnt remains were a few flint chips and

small flakes, but nothing more. The surface stones did not cover the extreme western point, thirty-eight feet from the first fireplace, where these ashes were buried.

There is still much to be done in exploring other spots in the immediate vicinity of the serpent before we shall know all that the earth has hidden of the past relating to this old monument. But the outlines of a picture have been traced out, which can be filled in as individual fancy may dictate, or as discoveries here and elsewhere may determine. It is evident that written history will be of little aid, although the customs of some of the many tribes or peoples who have passed to and fro over the land may give us a hint, here and there, to the better understanding of some things which have been revealed. History, however, has its limits, and any attempt to make it apply to a time anterior to those limits, and from vague general resemblances to draw conclusions, is unwarranted. Let the archæologist work on with greater care than ever before. Let him, if possible, start with the earliest traces of man, and, step by step, follow his record in the past down to the dawn of history, when language, myths, and legends open the door to the historian, who then takes the place of the archæologist.

To work in the other direction, with the idea that language and history can tell us of the relations of mankind in early times, is starting with the assumption that man has everywhere, and in all past times, been as now; that there has been no development within a race, no diversity of races, no migrations of peoples, except in recent times, and no change in the innumerable languages now spoken. The origin of any one of these languages is not as yet actually known and probably never can be known, from the fact that archæology leads us to believe that man existed so long ago that the thousands of years since man in America hunted at the foot of the glaciers are but as yesterday compared with his probable but still unknown origin. What languages were spoken throughout all this time? We only know that the skulls of earliest man yet discovered are as perfectly those of man as are our own, and of man with a brain capacity and muscular and bony structure indicating powers equal to those of races existing to-day. Some races have developed these powers more rapidly than others. Who is yet able to state where man originated? and who but the archæologist,

¹ That the skulls of individuals were considered important objects, perhaps trophies, as with the Dyaks, is evident from a singular burial which we discovered in a mound in the Little Miami Valley, where the skeleton of a man and that of a woman were found buried at full length in ashes, and surrounded by sixteen

skulls, which showed by the scratches upon them that the flesh had been removed by scraping. Six of these skulls had small holes bored in them as if for the purpose of decoration, and at least two of them had also been partly painted red.

with the aid of the geologist, can take up the snarled skein with any hope of unraveling the great mystery of man's origin?

What light is thrown back over one brief period of the past by this study of the Serpent Mound and its surroundings, this singular structure in the midst of many other strange earthworks in the Ohio Valley! If history can now lend its aid and bring out some points with clearness, much will be gained. But it must be critical and trustworthy history, and not the simple patchwork of vague generalities.

Here, on this commanding point of land, in many ways adapted to what we know of the ancient faiths of man, is an imposing structure in the form of a huge serpent guarding an oval inclosure within which is a mound of burnt stones; all essential points in the fulfilment of special religious rites connected with the older faiths, which, so far as we know, had their greatest development in Asia, which is the land, more than any other, that we have reason to consider as the original home of the brachycephali, one of the early peoples of America. Exploration has shown us that this serpent was made many centuries ago, and it is evident that a structure of such magnitude, so carefully planned and executed, was intended for some great purpose deeply affecting the people who made it. Again let me ask, what other than a religious motive could have

been sufficient? Assuming this to be the case, we naturally give it the meaning of a religious shrine to which the people came at specified times to worship their gods. It is evident that there was never a very large community living on the plateau near the shrine, and the probability is that it was more a place of habitation in after than in early times. Here, near this sacred shrine, ceremonies of great import have taken place; individuals of importance have been buried in connection with ceremonies of fire, and in two instances, at least, accompanied by the burning of human bodies—possibly human sacrifice, that constant accessory of many ancient faiths. In later times the shrine was still a place of resort, possibly as one held sacred in myths and legends; and finally a few of the scattered bands of the last century made their habitation on the spot, probably without any legendary knowledge or thought of the earlier worshipers at the shrine, overgrown and half hidden by a forest which seventy years ago was of the same character as that on all the hills about.

Now another race has come, and the old shrine, cleared of rubbish, is again held sacred; not for ancient and awful rites, but for the study of future generations, when a wider knowledge of the past in other countries shall lead to a better knowledge of that of our own.

F. W. Putnam.

ORNAMENT CUT FROM CRYSTAL OF GALENA FOUND IN GRAVE.
(NOW IN THE PEABODY MUSEUM.)

THE LATEST SIBERIAN TRAGEDY.

THE "New York Tribune" of Sunday, January 19, contains the following letter from "An Occasional Correspondent" in St. Petersburg, in regard to the recent massacre of Russian political exiles in the East Siberian town of Yakutsk:

ST. PETERSBURG, January 1.

The account contained in the London "Times" of a massacre of political exiles which is alleged to have taken place last autumn at Yakutsk, in Eastern Siberia, has created a considerable sensation here. Under ordinary circumstances the Imperial Government disdains to take any notice of the British "Thunderer," being aware of the position which the slayer of the Chief of Police, General Mezentseff, and nihilist leader, Katschefsky, better known by his pen-name of "Stepniak," has for several years past held on the editorial staff of the "Times." In the present case, however, the latter's story of

the alleged Yakutsk massacre has received such wide publicity, and has excited such a hurricane of indignation throughout the continental press, that the Tsar's government has considered it advisable to abandon its customary policy of contemptuous silence, and to vouchsafe an official explanation of the incident. It denies the massacre, but admits that two sanguinary affrays took place at Yakutsk under the following circumstances:

"About a year ago the secret police department here received information to the effect that most of the nihilistic pamphlets, proclamations, and other revolutionary publications were not only written but also printed in Siberia. At first sight this appeared almost incredible, in view of the close supervision to which both prisoners and exiles are subjected in the Tsar's great penal colony. However, it was deemed prudent to make inquiries into the matter, and accordingly Captain Russanow, one of the cleverest members of the Third Section of the Impe-

rial Chancellerie, was despatched to Siberia for the purpose. After much careful and patient investigation, he succeeded in discovering the existence of a most elaborately equipped secret printing establishment at Yakutsk. The latter is about the last place on earth where one would have imagined the nihilists to have established their presses, for only the most dangerous and desperate prisoners and exiles are interned at Yakutsk. Their names are not even known to the local authorities, since from the moment that they leave Tomsk they are deprived for the remainder of their days of their patronymics, and are designated by numerals only. By reason of their dangerous character they are supposed to be under specially strict surveillance.

"Captain Russanow, however, found that by means of heavy bribes they had succeeded in corrupting the Baikal Cossacks appointed to guard them, and that the latter actually helped them to forward their missives to Russia. Having made his preparations, he caused the building in which the nihilist presses were located to be surrounded one night by a detachment of police and soldiers, and after a sanguinary affray, during which several of the police as well as the conspirators were severely wounded by revolver-bullets and saber-cuts, the occupants of the premises were seized and thrown into prison. A few weeks later they were brought up for trial, and, with a moderation unusual under the circumstances, the judges contented themselves with sentencing them to deportation to various still more distant and severe penal settlements. The object of the court was to disperse the band and to scatter them to great distances from one another, so as to put at an end all communication between them. The official statement adds that when leaving the court-room, after the delivery of their sentence, they suddenly attacked their escort, and several of them having revolvers concealed about their persons began to use them against the police officers who were present. Troops hurried to the rescue of the latter, and before the revolt of the prisoners could be quelled it was necessary to shoot down and to bayonet several of their number. Three of the survivors were subsequently hanged, and the others were condemned to penal servitude in the mines instead of to mere deportation."

The explanation thus vouchsafed by the Government obtains universal credence here.

It is gratifying to see even such evidence as this that the Tsar's ministers are not wholly indifferent to the opinion of the civilized world, and that they can be forced into an explanation—even although it be a shamelessly false explanation—of some of their extraordinary acts. Looking at the question, however, from the point of view of expediency, it would have been better, I think, for the Russian Government to have ignored altogether the charges of cruelty and barbarity made against it by the London "Times" than to have met them with a series of statements that are not only false, but absurdly and grotesquely false.

The massacre of the political exiles in Yakutsk occurred last March—twelve months ago. Even in a country where cruelty and

violence are common, such an event as the Yakutsk affair—the shooting of fifteen or twenty almost defenseless political prisoners, the bayoneting to death of an unarmed woman, the hanging of three of the survivors, and the condemnation of all the others to penal servitude—is an event that would attract the attention of the most careless and indifferent press. It is an event of capital importance, no matter what view be taken of the circumstances. The most careful reader of Russian periodical literature, however, would have searched the pages of Russian newspapers and magazines in vain for even the briefest reference or allusion to this wholesale slaughter of educated men and women in Eastern Siberia. For ten months the whole Russian press has been profoundly silent in regard to it; not because the Russian editors were ignorant of it, not because they regarded the shooting of defenseless men and the bayoneting of innocent women with indifference, but because their mouths were stopped by the gag of the press censor. I myself take and read constantly four or five Russian periodicals, including the daily "Russian Gazette" of Moscow, the "Viestnik Europa," and the "Oriental Review" of Irkutsk, which is published in the capital of Eastern Siberia, only a short distance, as Siberian distances go, from the scene of the Yakutsk tragedy. Not one word has appeared in any of the above-named periodicals in regard to this most aggravated case of cruel and unprovoked murder. The Government apparently dared not submit to its people even its own version of the facts. If it had a good case or a valid defense, why did it not say simply in the beginning that the political exiles in Yakutsk were arrested and tried upon the charge of maintaining a secret revolutionary printing establishment; that, while leaving the court-room, they made an armed assault upon their guards; and that it became necessary to put down the revolt, even at the cost of serious bloodshed and loss of life? The only reason why it did not take this course was that it dared not provoke inquiry and comment. It hoped to keep the whole Russian people in ignorance not only of the circumstances of the massacre, but even of the bare fact that a massacre had occurred.

My first information in regard to the Yakutsk tragedy came to me in a private letter from Siberia last summer. Since that time I have received *eight* separate and independent accounts in manuscript of the whole series of events, with copies of the official documents relating to the case; plans of the house and courtyard where the massacre occurred; the names of all the officials and exiles concerned; the full text of the sentence of the court martial

that tried the survivors; the last letters of the three men who were hanged; and all the minute details that are essential to a complete understanding of the situation and the circumstances. These accounts, if translated and published, would fill two whole numbers of *THE CENTURY MAGAZINE*, and they have come to me from eight different individuals—not all of them exiles—and from half a dozen different parts of the Russian Empire. With some of the writers I am personally acquainted, and I know them to be men of the highest integrity and honor—men who are absolutely incapable of willful misrepresentation, even for the attainment of the best of ends. Besides this, they are separated one from another by thousands of miles of Siberian steppe and forest; they could not possibly fix up a collusive story to deceive me, even if they wished to do so; and not one of them knows that any of the others have written to me. It is hardly necessary to say that evidence obtained in this way, from eight independent sources, and duly authenticated by names, dates, diagrams, and copies of official documents, is worthy of full credence. It is evidence that would carry conviction to the minds of any unprejudiced jury; and I am confident that, when published in full, it will convince the American people not only of the cruelty, but of the shameless mendacity of a government that is capable of such acts and such explanations.

The officials quoted by the "*Tribune's*" correspondent attempt to discredit the account of the massacre printed in the London "*Times*," first by attributing it to the well-known Russian author Stepniak, and then by blackening the latter's personal character. This is a characteristic Russian method of dealing with damaging facts. To attribute arbitrarily an unpleasant disclosure to an enemy, and then to call that enemy an assassin, is the Russian bureaucrat's highest idea of strategy. I do not think it necessary to defend Stepniak, since he is quite able to defend himself. I do not even know whether he is the London "*Times's*" correspondent; but I do know that the account of the Yakutsk massacre that the "*Times*" has published is, in every essential detail, absolutely true; and that, although expressed in different words, it is in complete harmony with the eight independent manuscript accounts that I have received from Russia and Siberia. The narratives sent to me are longer and contain more details, but they confirm every material circumstance set forth in the "*Times*" story.

The Russian officials in St. Petersburg, as quoted by the "*New York Tribune's*" correspondent, say that the Siberian tragedy was indirectly the result of the discovery in Ya-

kutsk, by Captain Rusinof, of a complete "nihilistic" printing establishment. This is false in every particular. General—not Captain—Rusinof went to Siberia, ostensibly to investigate the life and circumstances of the political exiles, nearly two years ago; but he did not visit Yakutsk, and he long since returned, I believe, to St. Petersburg. His most noteworthy exploits were, first, the suppression of the Tomsk liberal newspaper, the "*Siberian Gazette*," for giving employment to political offenders and for publishing an obituary notice of one of them; and, secondly, the erasure of all inscriptions from the tombstones of dead political exiles in the Tomsk burying-ground. Among the inscriptions thus erased under his personal supervision were: "A——B——, died in solitary confinement in the Tomsk prison, ——th, 188—," and "B——C——, died in Tomsk, ——th, 188—, in the ——th year of his age." To the latter record were appended the words of Christ, "Greater love hath no man than this, that a man lay down his life for his friends." These words were expunged.

I presume that an officer who is capable of pursuing political offenders into their graves and erasing the words of Christ from their tombstones is capable also of discovering a "nihilistic" printing office in a city that he never visited; but, if so, why did he not seize and break up that printing office while he was in Siberia? It is now almost two years since I read in my Siberian newspapers notices of his movements in the places that he visited.

To a person who knows the town of Yakutsk as I know it, the story of the discovery there of a secret "nihilistic" printing establishment is incredible on its face. Printing presses do not grow in Russia on every bush. They are regarded by the Government as more dangerous than dynamite, and they are surreptitiously procured, even in the great cities of St. Petersburg and Moscow, with the utmost difficulty and at a terrible risk. How could a handful of political exiles, living under the strictest police supervision and almost destitute of money, obtain a printing press in the far-away town of Yakutsk? There is no newspaper in the place, and, so far as I know, there is not a printing press within a thousand miles of it. But, waiving that consideration, what effective use could the political exiles hope to make of a printing press *there*, even if they miraculously could obtain possession of one? Yakutsk is only an overgrown log village of six thousand inhabitants; every one of its citizens is known both to the post-office authorities and to the police; and the correspondence of the political exiles is under the strictest "control." How could they forward

"nihilistic" literature in any considerable quantity to European Russia, four thousand miles distant, even if they had the means of printing it?

The St. Petersburg officials, as quoted by the "Tribune" correspondent, say, furthermore, that "only the most dangerous and desperate prisoners and exiles are interned at Yakutsk. Their names are not even known to the local authorities, since from the moment that they leave Tomsk they are deprived for the remainder of their days of their patronymics, and are designated by numerals only." Both of these statements are false, and the latter is absurd. Fully half of the political exiles in Yakutsk were sent to Siberia by administrative process without trial. There was not proof enough against them to secure their conviction even in a Russian court, and they were banished by virtue of a simple order from the Minister of the Interior. If they were "dangerous and desperate," why did not the Government prove their criminal character in a court of justice?

The assertion that political exiles or convicts are deprived of their names when they pass Tomsk, and are known thereafter by numbers, is so far from the truth as even to throw doubt upon the origin of the "Tribune" correspondent's story. Both common criminals and political offenders are known by their names in all parts of Siberia—even at the mines. The names are sometimes assumed, but the use of numbers to designate convicts in Siberia is practically unknown. Only one instance of the kind ever came to my knowledge, and in that case the convict succeeded in concealing his name and personal identity, and was sent to the mines as "Number Two" simply because the Government did not know who he was.

The St. Petersburg officials, as quoted by the "Tribune's" correspondent, say, furthermore, in explanation of the Yakutsk massacre, that when the "dangerous and desperate" political exiles were leaving the court-room, after they had been tried upon the charge of maintaining a secret "nihilistic" printing office, they suddenly attacked their guards with loaded revolvers, and it became necessary to shoot and bayonet them in order to quell the revolt.

The exiles seem to have obtained their loaded revolvers in the same miraculous way that they obtained their printing press. Every one who is at all acquainted with Russian prisons and courts must be aware that a criminal is always searched before being committed to a cell, and that he is still more carefully and thoroughly searched before being conducted into a court-room. It is utterly impossible and incredible that "dangerous and desperate"

political offenders should have been allowed to take loaded revolvers into their cells when they were arrested and imprisoned, and still more incredible that they should have been permitted to carry such deadly weapons in their pockets to the very court-room where they were to be tried. Russian police officers may be stupid, but they are not stupid enough to bring "dangerous and desperate" prisoners before a court with their pockets full of loaded revolvers.

The whole story bears every mark of a clumsy invention, intended to break the force of the real facts and to deceive readers who are not acquainted with the conditions of exile life. The affray in Yakutsk was not the result of the discovery of a secret "nihilistic" printing office, nor of an attack made by "desperate and dangerous" men upon their guards. It was the direct result of official stupidity and brutality, and the indirect result of a cruel and unnecessary order issued by the acting governor of the province of Yakutsk, General Ostashkin (Os-tash'kin). That officer proposed to send twenty or thirty *administrative* exiles into the arctic regions, without proper equipment, and in parties so large that they would almost inevitably starve to death on the road, owing to the impossibility of procuring food. I know that region thoroughly. I traversed a part of it on dog-sledges in the winter of 1867-68, and I remember that, for a whole week, my thermometer indicated temperatures ranging from forty to fifty degrees below zero, Fahrenheit. I nearly lost one of my men who came into camp at night insensible from cold; and well fed and perfectly equipped as I was, I suffered intensely from incessant hardship and exposure. Into this polar wilderness, which I traversed with the utmost difficulty on dog-sledges in 1867, Governor Ostashkin proposed to send twenty or thirty political exiles—two or three of them young girls—without an adequate supply of food, without proper equipment, and in parties so large that, in all probability, the half-wild Yakut drivers at the widely separated stations could neither feed them nor furnish them with transportation. When the exiles sent respectful petitions to Governor Ostashkin, asking merely that they be forwarded to their destinations, as they had previously been forwarded, in parties of two, a week apart, and with proper food and equipment, the governor sent a company of Cossacks, with loaded rifles, to the house where the petitioners had assembled to await his answer, and directed the officers in command to take them to the police station. The Cossacks attempted to drive the bewildered exiles out of the house by pricking them with their bayonets and striking them with the butt-ends of their guns. Resistance

was offered by a few, who did not understand the meaning of this unexpected reply to their petition, and then followed the butchery that the London "Times" correspondent has described. Six of the politicals were killed outright, including one young woman bayoneted to death, nine were severely wounded, and all of the others were brutally beaten and maltreated.

The London "Times," in a leading editorial upon this terrible tragedy, asks the pertinent questions, "Is it possible that these things can be done with the knowledge of the Tsar, who passes for a humane man? Is he so blinded by absolutist theories as to harden his heart against all these tales of suffering, of stupid repression, and of the cruelty which infuriates the class against which it is directed? If not, he has a magnificent opportunity of, once for all, putting a stop to scenes and systems which disgrace his government and his religion."

Such outrages do not repress, they merely exasperate; and thus increase the evil that they are intended to remedy.

The survivors of the Yakutsk massacre were tried by court martial, without benefit of counsel, upon the charge of armed resistance to the authorities, and all were found guilty. Three of them were hanged; fourteen, including four women, were condemned to penal servitude for life; five, including two women, were

sent to the mines for fifteen years; four boys and girls less than twenty-one years of age were condemned to penal servitude for ten years, and two others were sent as forced colonists to the arctic villages of Verkhoyansk and Sredni Kolynsk, in "the remotest part of the province of Yakutsk." And this sentence, the St. Petersburg officials say, is an evidence of the "unusual moderation" of the judges who composed the court martial! A further proof of this "unusual moderation" is furnished by the fact that the political exile Kohan-Bernstein, after receiving four severe bullet-wounds at the time of the massacre, and after lying nearly five months in a prison hospital, was carried to the scaffold on a cot bed and hanged by putting the noose around his neck and dragging the bed out from under him. If this is Russian "moderation," one might well pray to be delivered from Russian severity.

One of the executed men, two hours before the rope was put about his neck, scribbled a hasty farewell note to his comrades, in which he said, "We are not afraid to die, but try—you—to make our deaths count for something—write all this to Kennan."

The appeal to me shall not be in vain. If I live, the whole English-speaking world, at least, shall know all the details of this most atrocious crime.

George Kennan.

DAFFODILS.

FATHERED by March, the daffodils are here.

First, all the air grew keen with yesterday,
And once a thrush from out some hollow gray
On a field's edge, where whitening stalks made cheer,
Fluted the last unto the budding year;
Now, that the wind lets loose from orchard spray
Plum bloom and peach bloom down the dripping way,
Their punctual gold through the wet blades they rear.
Oh, fleet and sweet! A light to all that pass
Below, in the cramped yard, close to the street,
Long-stemmed one flames behind the palings bare,
The whole of April in a tuft of grass.
Scarce here, soon will it be—oh, sweet and fleet!—
Gone like a snatch of song upon the stair.

Lizette Woodworth Reese.

THE OLD POETIC GUILD IN IRELAND.

A BAGPIPER.
(FROM THE IMPERIAL DICTIONARY.)

FRIEND and foe of the Irish agree to allow them preëminence in two matters — poetry and music. Welsh history states that music came to Wales from Ireland, and nowhere do we find records of a poetic guild so abundant and minute as in the literature of Ireland gradually being brought to the notice of the world. A sketch of this caste is all that can be given at present.

The guild of poets has been as elaborately subdivided in Ireland as in Wales, where the common term is “bard,” while in Ireland that word is either not at home or at some period sunk in the social scale, “filé” being the proper word. But without doubt the arrangement of the profession conformed to the political fashion of the day. We hear of Ollaves or Doctors of Poetry, with an Ard-Ollave at their head; of Anruiths or Masters, who formed the next rank; of Clis, and so on. The corporation was called the Fíli-decht, and seems to have reached importance between the fall of Druidism and the time when Columbkille, the saint of royal Irish blood, established thoroughly the supremacy of the Church as St. Patrick understood it, by eloquence, by mortification of the flesh, by political moves, and even by the sword. Before his time the guild was a great nuisance to chiefs and people, owing to the religious or superstitious awe with which the poets were regarded. Outwardly Christian, filés were merely Druids deprived of some of the terrors which pertained to them. The old histories refer to several occasions when the exactions of the poets caused their banishment; but only with the age of St. Columbkille do we get anything that affords a firm basis. In A. D. 574 the saint came back from the island of I to Drom-Ceata, not far from Derry, at the invitation of Aedh, son of Ainmiré, who wished to drive all the troublesome singing and piping gentry out of Ireland. “I do not wish to continue to maintain the Fíledha,” answered Aedh when the saint begged him not to expel the poets, “so extreme is their insolence, and so great are their numbers; for the ollave has an attendant train of thirty followers, and the anruith has a train of fifteen; so of the other members of that order downwards, each per-

son has his special number of attendants allotted to him according to his rank, so that now almost one-third of the men of Ireland are members of the order.”

In reward for conforming at least outwardly to Christianity the filés were so well defended by Columbkille that the chief king retained his chief ollave, subordinate kings their particular ollaves, and filés were allowed to chieftains. We find in the Highlands of Scotland the piper attached to the person of each chief of note. It is probable that the custom there represents a very primitive and simple form of entertainment common to all parts of Europe, not excluding Rome, in which the performer was a bagpiper, a flute player, or a harper. Wherever instruments were introduced which do not require the breath, the voice of the performers became important. Yet the name originally signifying the instrument would come to mean the person. Filé may be considered equivalent to piper in its origin, but in

MOORE'S HARP, DUBLIN MUSEUM.

LARGE BRONZE CALDRON.
(FROM A PHOTOGRAPH BY W. G. MOORE.)

Ireland it was of such old standing to signify a person of higher rank than a performer on flute or bagpipe, that its first meaning was entirely unknown to the Irish speakers of Gaelic.¹

The difference between the Welsh bard and the Irish *filé* appears to be merely in name, and springs from the difference in the instrument used at different epochs. Welsh history records that music was revived in Wales from Irish examples not long before the Norman conquest; with that revival we may consider that the term of "bard" came in. But the word bard refers to the "burden" (French *bourdon*), the humming sound of a stringed instrument; while "*filé*" arose from the shrill sound of the flute or pipes—earlier and more primitive instruments than the harp. We may consider, then, that the revival of music in Wales in the Middle Ages by Irish minstrels brought back the harp to Britain; but in Caledonia the early colonists from Ireland introduced the bagpipes, if not already the favorite instrument there. In the twelfth century Giraldus de Barry draws these distinctions between the three countries: "Ireland only uses and delights in two instruments, the harp and the tabor. Scotland has three, the harp, the tabor, and the crowth, or crowd; and Wales the harp, the pipes, and the crowd." So that we find the bagpipes even in Wales according to this Welsh authority, but may well doubt whether the remote parts of Ireland, into which he never penetrated, could have lacked the bagpipes, and can be quite sure that he omitted them in error from the musical instruments of Scotland.

That Ireland and Caledonia had the tabor, or small drum, we may well believe, for that is the special instrument for summoning spirits; but as such the tabor was disliked by Christians, since its monotonous noise was used while the Druid or poet went into a trance. The process by which a poet threw himself into an ecstasy is very similar to that found

by Castrèn among the Lapps and Samoyeds of Siberia, even to the eating of dog's flesh as a preliminary. A curious story of the pursuit of the Fomor by the Dagdé, or "good god," has an invocation of a captured harp, in which the Dagdé cries: "Come summer, come winter, from the mouths of harps and bags and pipes!" And a later legend, containing in verse an adventure of Fion, says:

The household harp was one of three strings,
Methinks it was a pleasant jewel:
A string of iron, a string of noble bronze,
And a string of entire silver.

The initial shows a bagpipe common to the British Isles. Minstrels of Finland still employ a harp when singing the long runes of the Kalewala; the latter resembles a large zither. A harp like this must have existed in Ireland down to the Middle Ages, when the small upright harp as it appears on the coins of Ireland and on the flag became the fashion. The harp in Dublin Museum called the harp of Brian of the Tribute, but probably an instrument of the fourteenth or the fifteenth century, not the eleventh, is the modern type. The harp of Tom Moore is given in order to show the most modern form of this harp. It belongs to a revival of harpistry at the close of the last century, when very fine harps were made for some years in Dublin.

The poetic guild suffered during the later Middle Ages from the bad character of many of its members, who became degraded into strolling adventurers ready to commit depredations; they became bad "*fellows*" in England and *filous* in France. The Bulgarians called certain fairies or elemental spirits *vilas*. In Ireland they had bad and good characteristics very sharply expressed long before the Middle Ages. The laureate, or official poet, of Ireland, who had shown himself the possessor of a wonderful memory, was distinguished by a seat at banquets and public ceremonies, a certain arrangement of his hair, and a special cloak decorated with the feathers of song birds. In the last point, and in the superstition that his satires could produce disfigurement or blemishes on persons satirized, the Irish *filé* again recalls to the wizards of the medieval Finns and modern Samoyeds. Another very ancient musical instrument was a stand of crotals, or small bronze bells, now used only on animals. The cut shows these adapted for young girls, children, and pets.

The dread of satire is yet alive in Ireland. Within the last decade a local bard of Lim-

¹ Through Celtic *F*, for Finno-Ugrian *P*, this word is traced in Finnish and Estonian *pilli*, Estonian *wile*, a pipe, a bagpipe, a flute. Proscription of min-

strelsy brought the *filés* so low that *filou* was degraded in French to the meaning of thief, and *gwiliad* in Welsh to that of stroller, vagabond.

erick is said to have procured for himself an office by satirizing in verse the town council. Aenghus O'Daly, one of a famous family of bards, who is supposed to have lived about A. D. 1600, has left a most venomous satire on the Irish sept of his day, which has been published by John O'Donovan under the title of "The Tribes of Ireland." Edmund Spenser was concerned at the number of "carooghs, bardes, jesters, and such like" who straggled up and down Ireland, or "miche in corners amongst theyr frendes idlye." Yet the great poet, while reproving their tendency to laud the greatest robbers of the country, remarked of their songs: "I have caused diverse of them to be translated unto me that I might understand them; and surely they savoured of sweete witt and good invention, but skilled not of the goodly ornamentes of Poetrye; yet were they sprinkled with some pretty flowers of theyr owne naturall devise which gave good grace and comeliness unto them." Had Spenser been able to read Gaelic; had he learned the language and made himself one with the people whom he helped to oppress,—and who destroyed his castle at Kilcolman after all,—what a difference there would have been in the estimate placed by English grammarians, poets, politicians on matters relating to the Gaels! Spenser would have brought to light not only the histories, legends, and poems we now have, but many others which have disappeared under the persecutions from which the Gaelic-speaking and Catholic natives have suffered, not to mention the loss of manuscripts through sheer ignorance that they possessed any value whatever.

That vileness which was the dark side of the Druid, and which reflects itself in words allied to the same root in many languages, was also in some degree part of the early *filé*. Indeed, we have notice of the period when it was found necessary to define the duties of a poet, who among other things was at one time very much the same as an advocate at law, while his magical verses made him a physician, or caused him to be feared like a Druid. At the foundation of the tripartite rule, or rule in succession, of three kings at the Navan, near Armagh, the compact was witnessed by Druids, poets, and champions—"the seven Druids to crush them by their incantations, the seven *filés* to lacerate them by their satires, and the seven young champions to slay and burn them, should the proper man not receive the sovereignty at the end of each seventh year." We have also an amusing instance of the obscurity of phrases used by two great poets in a contest of words. This reached such a pitch that the court re-

volted and the guild of poets was deprived of some of its privileges. The Druidic side is shown in the famous circuit made by Aithirné the Importunate, a poet whose virulence was such that no one dared say him nay, and whose greed and luxury finally brought many chiefs to death. His purpose was to stir up strife and give a chance for champions to collect human heads and acquire fame. Secure in his privilege, he asked whatever the chiefs most objected to part with, not excluding their wives, of whom he collected a troop and marched them off into slavery. The prophetic powers of a poet are shown on this circuit. A clod of earth containing a big brooch having fallen into the lap of a king, flung there from the hoof-stroke of a horse, Aithirné not only explained what was in the clod, but told exactly who had buried the brooch. On the hill of Howth, near Dublin, are the remains of an earthwork which is said to be the fort into which Aithirné fled when his insolence finally overcame the fears and hospitality of the men of Leinster. There he warded off their attacks under circumstances in which he showed bar-

large pot, or caldron, called "The Pot of Avarice." This was presumably the sign of an intention on their part to claim food from the chief they visited, though in the legend it was meant for the gold and silver they expected as perquisites. Caldrons of ancient make are found in the Dublin Museum, and one of bronze is figured on page 894. "The Pot of Avarice" was swung from the points of nine spears by nine chains, and was said to be made of silver. When they approached a house the leader of one of these parties, at one end of the line of minstrels, would begin with a verse. The second verse would be recited by the poet at the other end, and the third by the one next the leader. Thus the song jumped from one end of the line to the other. We have inferred that at one time the *filé* was no other than a piper and that the poet became also the singer, after a change of instrument left his mouth free for vocal music. But the separation of *Filé* from *Cruitiné*, or harper, must have been very ancient, for the Psalter of Cashel makes a distinction between northern and southern Ireland on this very point, giving the finest music to the south, the greatest poetry to the north.

The sweetness of string music,
blandness, valor,
In the south, in the south of
Erinn are found,
It so shall be to the end of time
With the illustrious race of
Eimher.

barity to his own men of Ulster who were defending him.

The extortions of the poets were conducted with a good deal of system. They were at times supported by the people; but it was difficult for them to collect tithes from the folk, or to get pay from chiefs whom they eulogized and whose genealogy and tributes they knew by heart. Often they went in bands, attended as fully as they could afford, and carried with them a

The professor of poetry with his noble gifts.
It is a matter of boast with the north that with
them has remained
Excellence in poetry and its chief abode.

The native brought up to speak Gaelic rarely obtained sufficient ease and mastery of the English language to achieve greatness as a poet. If he devoted himself to the tongue through which he might hope for some

OLD DRINKING VESSELS OF WOOD. (FROM A PHOTOGRAPH BY W. G. MOORE.)

of the prizes offered by the wealthier nation and the English-speaking settlers in Ireland, he lost his hold on his own fine language. Talents of the highest order have been stifled in Ireland owing to this unlucky situation, for the land was too impoverished by bad government to allow of a modern literature in Gaelic.

The *filés* who wrote and sung their ballads in Irish, how shall they be estimated fairly? It is a task that cannot be undertaken with any hope of useful conclusions until far more of the old ballads and legends shall be translated and their age, their historical elements, and their allusions explained. Almost everything is still to be done before the old literature of Ireland is sifted and annotated to the point where it can be compared with that of other lands. A beginning has been made by Professor Arbois de Jubainville of the Collège de France, for whose "*Essai d'un Catalogue de la Littérature Épique de l'Irlande*" and his two volumes of "*Cours de Littérature Celtique*" all Irishmen, and all who hope to learn something of primitive Europe through the remains of Irish literature, must be profoundly grateful. Very thorough studies of the music and musical instruments are found in Eugene O'Curry's "*Manners and Customs of the Ancient Irish*," with an introductory volume by W. K. Sullivan.

The apparently complete independence of Irish literature of the early writings by Britons is a constant surprise, and the professors of poetry among the Irish have no parallels in England. One must go to the Gaelic Highlands, to the bards from whom Macpherson obtained very late variants on many of the old stories and legends common to both countries, before a correspondence is discovered. In Iceland, on the other hand, we get figures among the *scalds* which are practically identical, and some of them bear Irish names. But we must give up the idea long cherished

by students of Norse that the Icelandic literature antedates the Irish. Everything points the other way. The Icelanders appear to have had political as well as commercial reasons for knowing more about Ireland than about Norway, for their natural neighbors were the Faroe, Shetland, and other islanders who are connected by blood as well as by language with the Kelts. Their *scalds* found it easier and more profitable to study in Ireland and Great Britain than in the countries about the Baltic. Viollet-le-Duc says that in the Middle Ages the best harpers came from Brittany and Ireland.

In the later centuries there is apparent among the *filés* a tendency to be lavish of adjectives, florid in narration, given to the grotesque and absurd. In the more ancient lays there are grotesque and far-fetched things, but these appear to come from some root of cosmology, mythology, legend; not from that striving after novelty which destroys literature in the eyes of judges. The effect of the Norman conquest is very clear in many of the later stories. This could hardly fail to be the case

GROUP OF MEDIEVAL HARPERS. (FROM VIOULET-LE-DUC'S "DICTIONNAIRE DU MOBILIER FRANÇAIS.")

APPROACH TO GLENGARIFF, BANTRY BAY, KERRY.

if, as we may be pretty sure, the fashion of writing down and reading off pieces, instead of reciting them from memory, only began to be general after the Normans arrived. Yet the wildest, most turgid Irish poem can hardly be said to contain comparisons so far-fetched as a large number of the Icelandic sagas, though written down about the same time, say from the twelfth to the fourteenth centuries. Alliteration, which is the chief artifice in the *Kalevala* of the Finns, and only less popular with the Saxon poets of England and Norse poets of Iceland, is used with the utmost discretion, so that even in those poems where it is the rule it does not force itself on the ear. The ordinary or end rhyme is common to Irish verse and has been thought to have driven alliteration out of English. The memorized tariff of tributes preserved in the "Book of Rights" has a good deal of rude rhyme; but so far as the present writer has observed, rhyme never became in Irish so fixed and artificial as it now appears in English and French poetry.

A medieval version of the battle of Magh Rath (*Moyrà*), which retains the metrical parts of an older version scattered through a prose account, after a fashion usual with Irish bards, shows slight traces of alliteration except in the lists of names of heroes, and hardly any of rhyme proper—at the most one may say of assonant rhyme. The battle was fought A. D. 637,

between Domnall, the chief king of Ireland, and Congall Claen, a fugitive prince of Ulster, assisted by a large army composed of Highlanders, Picts, and Saxons.

Congall had exiled himself because he took it as an insult at the banquet of the king that poor food was set before him. The king sends a band of monks after him. When Congall sees them he is so fierce that they run away, but do not fail to curse him with bell and book. Then the king sends the poets of Erin after him, when Congall exclaims: "The munificent character of Ulster is tarnished forever, for we gave the poets no presents at the banqueting house, and they are following us to upbraid us." So that the man who is depicted as crazily fierce and violent, a ruthless, insufferable tyrant, receives the poets well and gives them presents according to custom.

On reaching Scotland in his flight, Congall is met by the four sons of the king of Scotland with a demand from each that he shall make his stay with him. But each wants a certain caldron belonging to his father which has very convenient traits. "Why was it called *Caire Ainsicen*?" asks the writer. "It is not difficult. It was the *caire*, or caldron, which was used to return his own proper share to each, and no party ever went away from it unsatisfied; for whatever quantity was put into it, there was never boiled of it but what was sufficient for the company according to their

grade and rank." From a caldron like the one in the illustration, king, poet, and hero obtained their porridge, their boiled beef and mutton, and their venison. They ate flesh without forks, using their short skeans and their fingers to tear the meat. Their drink was ale or milk, kept in large receptacles like vats and served in wooden *methers*, or mead-cups, like those figured on page 897. The wooden mether was of course copied in metals or overlaid with thin shells of metal, but the great bulk of the people used those of wood. They are found from time to time in the bogs where they were concealed and forgotten, sometimes full of a curious substance which is supposed to be petrified butter.

The Druid of the exile's camp, going out to view this king and his army, returns and, to the great fury of Congall Claen, makes a magniloquent report of their appearance. As to Domnall himself:

Oh the size of the expert blue sword
Which is in his valiant right hand!
And the size of his great shield beside it!
The size of his broad green spear!

There are three clouds over his head —
A blue cloud, a black cloud, a white cloud;
The blue cloud of fine bright valor
And the white cloud of truth.

Families in Ireland, as in Scotland, maintained their harpers to celebrate the deeds of

GIANT'S CAUSEWAY, NORTH OF IRELAND.

The Battle of Moyrà is a very curious and beautiful medieval poem, containing later as well as ancient traits, some primitive pagan, others old Keltic, and not a few Norman. The night before the battle Domnall did not sleep, though some, remarks the poet, may have slept soundly to the "thrilling, agreeable, and symphonious musical strings," and to the "low, mournful, soft strains of minstrels." When addressing his army Domnall compares himself to the sledge that drives the nail home, and his five sons to sparks driven from an anvil.

My own five sons of ruddy aspects —
Fergus, Aengus of troops,
Ailel and Colgu not penurious,
And the fifth Conall.

These are the sparks of my body,
The safety of all lies in their attack,
Ready in each road, furious their action
When coming against foreigners.

ancestors and of the living, and we have most tragical instances of their devotion to such patrons, like the story of Loyal Ronins in Japan. But all is not tragic with them.

Craftiné the harpist was an early prototype of the crowders and blind harpers now vanished from Ireland, but still found in Finland, and in other countries even less popular with the tourist. Of him the pleasing tale is told how he outwitted the parents of a princess who fell in love with his young master. Cobhtach, by a crime the king of the greater part of Ireland, — for he had killed his elder brother and poisoned his nephew, the chief of Leinster, — sought at first to keep his grandnephew Maen an idiot, since Maen was dumb from his birth and could not be chosen king. But Maen destroyed these hopes by suddenly developing the power of speech in an altercation with a schoolmate on the play-ground. As this made him eligible to the throne, Cobhtach banished him and his

WITCH'S STAIRCASE, BLARNEY CASTLE, CORK.
(FROM A PHOTOGRAPH BY W. G. MOORE.)

tutor Craftiné on the first good excuse; whereupon they took refuge with a powerful chief near Bantry Bay, Kerry. Here Maen fell desperately in love with the daughter of his host, but without the aid of his harper would have failed, as all previous lovers had, because a watch was kept on the girl by night and day, her parents themselves taking turns.

Craftiné chose the hour of banquet as the time when people were least on their guard; he called for his harp and played with such expression and skill that all eyes were fixed on him. The lovers stole away from the hall, and then Craftiné began a measure which lulled the court into a slumber or state of trance, during which the prince and princess had time to exchange pledges of eternal affection. As soon as they

returned to their seats the harper changed from the Suantraighe, or sweet measure, to the Geantraighe, or lively measure, the effects of which were not only to awaken people from their trance, but to throw them into the happiest mood. Perhaps he changed again to a third measure generally mentioned in turn—the Goltraighe, or lament. At any rate the mother of the lovely Moriath heard the sound of sighs, which the maiden was too artless to suppress, and managed to extract from her the unwelcome news that she had pledged her troth to the exile. As the princess was inflexible, Maen obtained Moriath for his wife.

The poets of Ireland have been the men who collected the legends of Finno-Ugrian and Kelt and fused them into early songs out of which a later generation composed the literary treasures extant. They took the cosmological ideas common to each of these two races, made them more human, brought the gods from their sublime or malicious positions into flesh and

blood, and made history serve as a framework on which to hang the curious, stirring, sometimes beautiful thoughts of the past races. The poets recorded the actual warfare between the fierce pagan Finns still lingering on the islands off Ireland and Scotland, and the mixed Keltic-Ugrian tribes of Erin and Caledonia. But to make it interesting they identified the Finns with the autumn or winter, and with night, calling them Fomoraigh (Fowri), and attributing to them complexions unnaturally dark, and magical powers of great virulence, as noted in "Early Heroes of Ireland" in the JUNE CENTURY. The Finns treat the Lapps in the same way.

Whether as giants or as magicians who turn into seals, these men are still remembered on

the north coast. To coast-dwellers the Giant's Causeway is nothing but the remains of a line of stepping-stones joining Britain with Ireland, once used by the Fomoraigh. The basaltic columnar groups of rock are called *clochan na-bh Fomoraigh*, and the sea-caves thereabouts are thought to be haunted. Everything related is on a scale suited to giants, so that it is plain that the historical element in the tradition is faint compared with the mythological. The poet, as well as the tale-teller who does not compose in verse but uses prose, has preserved all these ideas after a fashion, so that one may still hear how Fion mac Cumhal met a giant who came across the sea by this causey, and how he fought or did not dare to fight him. The old myths, developed by the more learned poets into tragedies and comedies fitted for the listeners of their age, have retained in some places their early bigness and vagueness, and are merely nursery tales. In the grounds at Blarney Castle is a small flight of steps under a rock which has been seized by the imaginative in the same way, though apparently quite modern, and dubbed the "Witch's Staircase." But the great number of past *filés* has given to all the landmarks of Ireland a wealth of legend which can hardly be exhausted for many years, let ever so many volumes be published. Nearly

every lake has its story of a city overwhelmed for the sins of its inhabitants, or its dragon slain by Fion mac Cumhal, St. Patrick, or some other favorite of the people.

The long training of the people in verse-composing and verse-reciting predisposes them to the composition of poetry of some degree of excellence. Irishmen and Irishwomen as a rule have a knack at writing if they receive any education at all, and are natural journalists and writers at an early age. The last remarkable poet of the *filé* kind known in Ireland was Carolan, the blind bard of the last century, whose portrait, and some of whose verses, translated and in the original, were published by James Hardiman. He was as peripatetic as Homer is said to have been, blind also, and certainly a fine if not a great poet. Though the race is not extinct, little except the most ordinary verse is published in Irish to-day, the audience being too small to tempt the most ardent patriot. With all its inherited shortcomings, and with the evils that befell it owing to circumstances, the poetic guild of ancient Ireland did the world a great service in keeping from destruction historical and national data lost from other parts of Europe. It also added not a little to the world's stock of tragic, of noble, and of comic fiction.

Charles de Kay.

ROBERT BROWNING.

MOURN, Italy, with England mourn, for both
 He sang with song's discriminating love,
 Thy towers that flash the wooded crag above;
 Thy trellised vineyard's purple overgrowth;
 Thy matin balm; thy noontide's pleasing sloth;
 Thy convent bell, dim lake, and homeward dove;
 Thine evening star, that through the bowered alcove
 Silvers the white flight of the circling moth.
 He sang thy best and worst — false love, fierce war,
 Renaissance craft, child graces, saintly art,
 Old poms from "Casa Guidi Windows" seen.
 There dwelt he happy; there that minstrel queen,
 Who shared his poet crown but gladdened more
 To hold, unshared, her poet's manly heart.

Aubrey de Vere.

ON THE FUR SEAL ISLANDS.

BY THE FIRST SPECIAL TREASURY AGENT.

SHORTLY after the cession of Russian America to the United States, the latter government began to take active measures for the protection of the few fisheries of the islands of the ceded territory, and

thus it happened that I, as one who had had eighteen years' experience as a whaler in the North Pacific, became a factor in the plans for protection. My knowledge of the natural history, conditions of life, and currents of the North Pacific had brought me into communication with Professor Louis Agassiz and with Professor Benjamin Peirce, who was at the time Superintendent of the Coast Survey, and at their instance I was appointed by Hon. Hugh McCulloch, Secretary of the Treasury, first to report on the fur-seal fisheries and then to organize a system by which the interest of the islanders could be guarded and the seals protected against unnecessary destruction. The system established by me is still in active force. I reached the Fur Seal, or Pribyloff, Islands early in March, 1869, but it was not until the spring of 1871 that order was finally brought out of the confusion into which the fisheries had been thrown by the change in ownership, and we began operations under the lease granted to the Alaska Commercial Company. I had found the natives disorganized and terrified concerning their future, as the irregularities practiced by the various parties who had raided the islands for seals in the previous year had threatened extermination both to islanders and to seals; and the plan of fishing finally adopted was grafted on the general method which the Russians had observed, and in which the natives, who knew it, would therefore be likely to have confidence.

The Russians had maintained a head agent on the islands, with whom had been associated two creole subordinates who had been sufficiently educated in the counting-houses of Sitka to keep the accounts with the natives and to direct them in killing the seals and preparing the skins. A certain sum was allowed the islanders for compensation. The head agent employed three or four of the most capable men to direct parties at work, and the driving and killing of the seals had been left mainly to these. Their method had been to drive the

seals as near as possible to the salting-houses, in order that the labor of carrying the skins might be made as light as possible; and they had become sufficiently expert in their work to understand that by killing the smaller seals the work would be lighter, though no discrimination was made as to the quality of the skins in the animals killed. The number of skins taken annually had varied from forty thousand to sixty thousand.

That the Government agent in charge of the islands might have full power to enforce and supervise all operations, it seemed best to leave to some responsible company the right to take a stated number of seals under restrictions and regulations that would best subserve the interests of the United States and of the natives themselves, who were to have the exclusive right to kill the seals and salt the skins.

When the sealing began in the spring of 1871, it soon became evident that the clumsy methods in vogue were open to very great improvement. To take the necessary number of seals to fill out the annual catch, the whole working force of the islands was kept busy from the 1st of June until September, the women helping, particularly in carrying the skins to the salting-houses. These had been built too far from the landing, and as soon as possible they were moved nearer to the beach, in order to facilitate the transfer of the skins to the boats on shipping. As the skins prepared for shipment, and all the salt necessary for curing them, had to be carried on the backs of the natives across a broad beach of soft sand and through the shallow water to and from boats, a railway of light iron rails was eventually built, to be laid in movable sections, with high-wheeled flat-cars. Mules, carts, and harnesses were brought to the islands, and whenever the skins were to be carried to the salting-houses from the slaughter-grounds the boys and girls, for the sake of the ride back in the empty carts, were ready to load them. This relieved the women of the necessity of all outdoor work in sealing time, except occasional journeys for the necessary supply of seal flesh for food. Later, when we had taught them to make bread and had introduced various articles of food, seal flesh and blubber, which had been formerly almost the sole means of sustenance, were used much less frequently. Under the lease held by the Alaska Commercial Company the number

of seals to be killed annually was limited to 100,000; and at 40 cents a skin, the sum allowed the natives for each skin brought in, \$40,000 was annually divided among the islanders employed in the killing of seals. We learned when the returns for the first season's catch were made that the skins were assorted into fourteen or fifteen classes. A small number—less than ten per cent.—ranked as first-class, at \$14 a skin; about the same per cent. fell to less than \$2.50 each, while the general average was about \$5.87. This discrepancy in the value of the skins called attention at once to the question of what constituted the difference in quality between a skin worth \$14 and one worth only \$2.50. An agent of the Company was sent to London to examine the skins as they were classified for the market: the result of his examination revealed the fact that the fur of a seal was most valuable when the animal was three years old, the proportion being that at present prices a two-year-old seal would be worth \$15 or \$16, a three-year-old \$16 or \$19, a four-year-old \$16, and a five-year-old only \$2.50. As the agent had the opportunity of selecting the animals before killing, he aimed to take as many three-year-old seals as possible, making out the one hundred thousand from those two or four years old. This trebled the value of the annual catch at once. Again, it being desirable to secure the quantity with the least possible loss of life, a careful supervision of the manner of driving the seals to the slaughter-ground was instituted. Very fat seals often become overheated in driving, and die from convulsions, rendering their fur valueless for the market. In consequence of this difficulty each driver is required to carry a club and a knife, that any seal showing indications of an overheated condition may be killed immediately and skinned. These skins are collected after the herd is cared for, and are usually equal to eight or ten per cent. of the whole drive.

The cost of maintaining these fisheries is about \$10,000 a year; the revenue obtained during the twenty years that the present lease has been running amounts to \$365,000 a year. A careful count is made of the number of skins taken, each party through whose hands they pass keeping its own account. First they are counted by the chiefs, that the natives may be paid a proper sum; the Treasury officer in charge of the islands counts them when they are taken from the salting-houses for shipment; when received at the side of the vessel they are counted by the executive officer for his bills of lading; at San Francisco a revenue officer takes charge of them and has them counted; they are counted again at the warehouse in San Francisco, where they are packed

in one-hundred-gallon tierces and shipped to New York, and thence to London, where they are counted twice again before they are ready for sale. An important element in the economy of the business is that, by reason of the many improved methods used in capturing and handling the seals, the time required for this work has been materially shortened. Formerly the work was continued from the 1st of June until September, but now the whole time required for taking the one hundred thousand skins and shipping them has been shortened to forty-five days. This gain in time also increases the value of the skins, as the fur is far brighter when the seals first land.

The present lease to the Alaska Commercial Company expires July 1, 1890. When the lease was granted, in 1870, the bids were governed by the average price of sealskins in London, which had never exceeded \$6. Under the terms of the lease the Company paid the Government an average price of \$3.65 per skin. If the business was profitable at that rate, the Government should now obtain a much larger share, in consideration of the trebled value of the skins in the London market at the present time. As there should be a large increase in the number of seals now available, owing to the improved methods of killing which reserve all the females, a far larger number might now be killed annually—perhaps twice as many. The seals occupy as breeding-grounds about eight miles of coast-line, and at the beginning of my stay on the islands I estimated the number of breeding females to be fully 1,130,000. When I left, eight years later, a similar method of computation gave 1,800,000 breeding females on the ground.

The males come to the islands the 1st of May and remain until about the 20th of July, when they scatter slowly, although a large number of them remain as late as November. The males appear on the ground first, and soon after their arrival they begin to locate about a rod apart, forming a line the entire length of the shore. The younger and weaker males, beaten back by the stronger, coast along, entering the bays, and haul up on the hillsides and in the valleys. The greatest number at any one time upon St. Paul, the largest of the islands, is on the 20th of July, when we have estimated the number to be five millions. The seals really walk on four legs, raising their bodies from the ground as they move. Under favorable conditions they travel about a mile and a half an hour, and the longest drive we ever made was eight miles. As England alone has the necessary skilled labor for preparing the skins for final sale, she receives an amount of profit from the fur-seal fisheries equal to the whole profit of the United

States in the islands, and she therefore is equally interested in the question of wanton destruction of the seals. Under such circumstances an international agreement for the protection and regulation of the trade ought not to be difficult to obtain.

The Fur Seal Islands lie nearly in the middle of Behring's Sea, the nearest mainland being three hundred miles away to the north. When discovered in 1789 they were uninhabited, although traces of firebrands gave proof of earlier visitors. The islands are four in number — St. Paul, St. George, Otter, and Walrus, the former being the largest, though but fifteen miles long. It is triangular in shape, and furnishes ninety per cent. of the whole number of seals. The average mean temperature for the year is about the same as that of New England, though it is cooler in summer and warmer in winter. The islands are of volcanic origin, but around the shores accumulations of marine sand have been washed up by the sea, which high winds have driven over the rocky surface, forming a light soil. The moist climate has clothed this with a thick vegetation, and in the valleys and lower plains a wild grass resembling rye abounds, which furnishes excellent feed for horses and sheep. On the hillsides great masses of purple lupine grow, and a thick moss-like plant is found, which bears a delicious berry, and is much used for making wine as well as for cooking purposes.

On the whole group of Aleutian Islands there were 8000 people, and on the Fur Seal Islands about 400. A few of the men from the latter had been to Sitka on Russian vessels, and two or three had been taught enough of the Russian language to allow them to act as clerks in keeping accounts with the natives, but the great body of the people had never been from home. They had no money, and trade was chiefly a barter. The houses were merely turf huts, half underground, and the only fuel was seal blubber, and seal flesh and blubber almost the only food. For lighting their huts they also used seal oil, in small dishes with floating wicks, and of course the ceilings were always sooty. The necessity for improved habitations was evident, and later when the sealing company holding the lease offered to build houses and permit the natives to live in them free of rent, no time was lost in accepting the generous proposal. Before I left St. Paul there had been built small cottages of three rooms sufficient to house every family on the island. The people were so convinced of the necessity of keeping their habitations underground for warmth that at first we could not convince them that houses could be made comfortable in any other way. We passed through various stages of unsatisfactory yieldings to this preju-

dice, but our last houses were the best, and were built on high ground, uncompromisingly above the earth. A skillful mechanic was brought out by the sealing company, and under his guidance the natives soon became sufficiently expert to assist very materially in building. After a row of foundations, the length of the street, had been made ready, the people were divided into three gangs, who were soon able to put up one of these houses and finish it in a day. One gang laid the sills and floors, another set up the frame and boarded the house laid the day before, and the third shingled the roof and clapboarded the walls of the one framed two days before. We introduced furniture as quickly as possible, and it was not long before the islanders were as comfortably situated as are the average employees in any manufacturing community.

It was interesting to note the difference in character crop out as the community gradually took upon itself civilization. Some were naturally prudent, and easily saved a surplus; others would be in debt at the end of the year. In 1877 a small proportion of their number, perhaps ten per cent., had invested about ten or twelve hundred dollars with the Fur Company; another ten per cent. were always in want; the remainder spent what they received. The best paid class, the ablest workers, received over four hundred dollars each for their season's work, and as they could obtain a large part of their food from the resources of the island without cost, and received their houses furnished, rent free, their needs were few. To foreign ways in clothes and fashion they inclined very naturally. The year before my coming sealing-parties had brought to the island considerable quantities of ready-made clothing as an article of trade, and the men were consequently fairly well dressed; but only a small quantity of cloth suitable for dresses had been taken, and the women had not begun to make their clothing in any regular form. But in time, with some assistance, their ready adaptability made them a very well-dressed people. Before I came away the wives of those who had been saving sent their measures to Sitka with orders for silk dresses for church wear, and the young men arrayed themselves in broadcloth, wore gloves and well-blackened boots, and carried perfumed handkerchiefs.

As my time was not fully taken up with my duties, and good fortune brought to me an abiding place of unusual size for St. Paul, I seized the happy chance of making my house a meeting-place for the people, and especially for the children. Later we fitted up a school-room, which we also made a place for social entertainment, and kept the school open eight months in the year. We were greatly assisted

in our school duties by illustrated books and papers sent to us; for so unvaried and barren was the scenery of the island, which was all of the world these children had ever seen, that it was well-nigh impossible for them to comprehend physical objects of the simplest nature. What a mountain might be was beyond their understanding, and the difficulty of explaining the appearance of a great forest to children who knew no vegetable growth larger than the purple lupine on their gentle slopes was greater than one can tell. It was necessary, however, to exercise the strictest censorship in our illustrated lessons, as it was difficult for all to comprehend caricature even in its simplest forms; even the most impossible pictures they believed represented facts.

I found the people living in separate families, and, as far as I could see, there was no more immorality among them than would be

found in any decent civilized community. The women were modest in deportment, the children obedient and respectful to their parents, and the men always manifested a disposition to assist me in all my efforts.

In character they were mild and gentle, with the expression of settled melancholy habitual to those races which have no amusements. In this respect, however, they changed greatly as opportunity developed the merriment latent in their nature. The children when first taught to speak did so in a serious way, and the utter absence of anything like hearty laughter in a group of them always affected me strangely. It seemed as if their avenues of expression were closed to pleasure, and later, when they had learned the simple games I taught them, it was a great satisfaction to me to hear my rooms ring with their merry voices.

Charles Bryant.

"AND HIS WILL IS OUR PEACE."

E la sua volontade è nostra pace.—DANTE.

RESTLESS soul of man, unsatisfied
With the world's empty noise and feverish glare,
Sick with its hopes of happiness denied,
The dust and ashes of its promise fair;

Baffled and buffeted, thy days perplexed,
Thy cherished treasures profitless and vain,
What comfort hast thou, captive, thwarted, vexed,
Mocked by mirage of joys that merge in pain?

Though love be sweet, yet death is strong, and still
Inexorable change will follow thee;
Yea, though thou vanquish every mortal ill,
Thou shalt not conquer mutability!

The human tide goes rushing down to death;
Turn thou a moment from its current broad,
And listen: what is this the silence saith,
O soul? "Be still, and know that I am God!"

The mighty God! Here shalt thou find thy rest,
O weary one! There is naught else to know,
Naught else to seek — here thou mayst cease thy quest,
Give thyself up. He leads where thou shalt go.

The changeless God! Into thy troubled life
Steals strange, sweet peace; the pride that drove thee on,
The hot ambition and the selfish strife
That made thy misery, like mist are gone;

And in their place a bliss beyond all speech;
The patient resignation of the will
That lifts thee out of bondage, out of reach
Of death, of change, of every earthly ill.

Celia Thaxter.

A DUSKY GENIUS.

Je connois l'arbre avoir la gomme.—VILLON.

HE founder of a school of thought, the originator of a new strain in art, or the discoverer of an untouched region in the domain of science—any one of these is a tempting subject for an essay; but I hesitate to begin, although I feel sure of the unusual interest that the story of Rack Dillard's life and labors must command. Were it possible to set the man before the world, to be seen in flesh and blood, not even the most cunning art could add to the effect, for Rack Dillard was a genius of no doubtful quality, as a few of the world's keenest intellects have already found out.

He was a black negro slave, illiterate of course, or nearly so; a lover of tobacco; a Baptist in faith, and yet somewhat given to the use of profane language. Presently you shall see that he was the general type of his race—a personal forecast of the influence to be exerted by slavery upon the civilization which was to follow in the wake of freedom. His genius was but a slender strain, it is true, and the results of his labors appear slight; but we must keep our standard just while we measure. He was a slave throughout the flower of his life, drawing not one breath of absolute liberty before he was seventy years old, unable to read or write until after he was seventy-six, and quite ignorant of the simplest elements of mathematics, even when he died in triumph at the ripe old age of eighty-three. And yet he occupies a high place, despite the extreme restrictions and rigid limitations of his life. You will note that I say a high place is his now, although his elevation, as has been the case too often with genius, was not reached until after his death, which took place in 1872, at his humble little home in Rabun County, Georgia. Pilgrim devotees of the new school in art, enthusiastic followers of the latest form of science, are beginning to make Rack Dillard's grave a shrine; and the man who owns the rude cabin where this remarkable negro lived and worked so long is making a handsome income by demanding of every visitor a small fee.

Last spring, returning from a sojourn at Bay St. Louis, I bent my course so as to spend a week in the region made classic by Lanier—the high hill country through whose valleys

and gorges flow, with here a purple pool and there a foaming cataract, the two most beautiful rivers in the world, the Tallulah and the Uluftha. It was not to verify Lanier's musical descriptions, however, that I went up through the valleys of Hall into the heart of the Blue Ridge. The tender jingle of the poet's rhymes may have been in my ears,—doubtless it was,—but my thoughts were busy with the revolution that Rack Dillard had wrought in a certain domain of art and with the effect he had made upon one of the greatest forces in our civilization. I felt the picturesqueness, and, if I may say it, the fitness of the sketch I might make out of the materials of the old negro's life. It seemed to me that the world had not done its duty by him, and that his influence, while it had been made the most of, had not been properly acknowledged in a public way. It is true, as I have said, that a few zealous and enthusiastic men and women, mostly Southerners, to their credit be it said, have formed a quiet but efficient society devoted to the study of Dillard's, or, as it is usually called, Rack's philosophy, and some of the members make pilgrimages to Rack's grave; still the world has been kept in ignorance of him for whom the cult exists and by whom the school was founded.

The mountains of Rabun County are, I believe, the cerebral part of the great Blue Ridge vertebral column—the culmination, the flower of what is, perhaps, the most interesting chain of upheaval in America. The region is an extremely dry, isolated, and lonely one, with every element in its air, its quietude, and its stability of conditions to make it a congenial habitat for philosophy. Naturally it would be hard for news to escape from such a place, and, besides, mountain people are uncommunicative to an exasperating degree.

That Rack Dillard, the first man of science (both chronologically and in point of eminence) given by the negro race to America—that this preëminent, though illiterate, savant should have spent his whole length of days in the foothills by the rocky banks of the Uluftha—a slave, as I have said, for more than threescore and ten years—is a romance which grips the imagination more engagingly than can any story of troubadour or any chronicle of the age of heroes and gods.

Dillard's cabin, kept now by a shrewd Yankee for gain, is reached by a narrow clay

road slipping away from the pretty mountain village of Clayton and winding its course like a brick-red serpent through a dry, rugged, often picturesque country. As one advances, the character of the landscape gradually breaks up and assumes that composite quality so attractive to the artist and the geologist. The road slowly shrinks, as a river that loses itself in sand, and at last becomes a mere shadowy path, leaf-strewn and bough-shaded, drawn through the stony, brushy, silent hills to the foot of the mountain known locally by the appropriate but not over-euphonious name of the Hog Back.

For some distance before reaching the Dillard cabin, or, as it is better known, Rack's house, one follows the course of the beautiful Ulufta, with the bubbling water on one side of him and the tumbled, distorted, and rock-pierced foothills on the other. If he is a sportsman and has brought his tackle with him, here are pools and swirls whereon he shall not cast a fly in vain, since every stone in the stream has a shadow in which lurks a bass. The man of science will find much to study on every hand, and the artist could not ask for a more varied and fascinating field for his sketch-book and pencil. As for myself, somewhat given to the practices of the sportsman, the artist, and the votary of science, all in turn, not a step of the way failed to interest me vividly. Looking back at it now, the little journey fills me with a sense of the picturesque and the romantic, touched with a dry, arid, preservative quality quite indescribable, yet altogether distinct and well ascertained. The huge fragmentary rocks with their sear gray lichens worn, like faded rosettes, upon their imperishable breasts; the trees, now stunted, now gigantesque, as the soil varied or the species alternated, touched with green and yellowish mosses near the ground; the sound of the breeze overhead, and the murmur of the river here or a spring-stream there; the fragrance of opening buds and springing spathes; the voices of birds, many of them mere migrants, like myself, dallying for a day or two—all these, with glimpses of high precipices and far blue peaks, the whole overarched with a tender, almost violet sky, linger with me, as vague as a dream, as real as the furniture in my study, making up one of the most striking and perpetually differentiated impressions set in my memory.

When at last one turns aside from what by courtesy is the main road, he approaches Dillard's cabin from the west, the gravelly bed of a bright brooklet serving as guide. The structure appears to lean for support against the face of a perpendicular cliff whose fringe of cedars, stunted and gnarled, overtops the

decaying and mossy roof that slants forward so as to cover a rude porch or veranda in front, near which stands the stump of an old mulberry tree. Thanks to the keen business sense of the Yankee, the place has been kept just as Rack left it, with all its furniture and belongings intact.

From the cabin door a well-worn path curves round the corner of the escarpment and turns over the hill-spur to the much more pretentious dwelling formerly owned and occupied by Rack's master, Judge Spivey Dillard, a somewhat eccentric man, who during the latter part of his life devoted all his time in a way to biological investigations and to reading the works of Darwin, Owen, Macgillivray, and Alfred Wallace. He was a bachelor, living alone, surrounded with such luxury as he cared for, leaving to his slaves the management of a valuable plantation in the bottom lands of the Ulufta River.

Rack was about sixty years old when his master retired him from active field work and permitted him to assume the lighter duties of a house servant—a man of chores, to come from his cabin at any moment, day or night, rain or shine, whenever the judge blew a blast upon a small tin horn kept for the purpose.

Doubtless it was from his master, who as his years increased became more and more inclined to scientific garrulousness, that Rack caught the first suggestions which led to his singular, and under the circumstances successful, career in a slender but interesting course of science and art.

The earliest intimation of the negro's work in his chosen line came to the judge one day when he blew his horn and for the first time Rack failed to answer the summons. A second blast had no better effect, and a third echoed away through the woods without response. Judge Dillard felt sure that his faithful servant had met with some ill, and, acting upon the moment's impulse, hastened over to Rack's cabin, where he found the old fellow in a rapt state, seated on his sheepskin stool under the then flourishing mulberry tree. The judge thought that Rack was asleep; the suggestion engendered rage.

"Rack, what do you mean here, you lazy old lubber you? I'll wear you as thin as a hand-saw in half a minute!" he exclaimed, rushing upon him and shaking him till he fairly rattled.

Rack bounced up like an india-rubber ball, and drew in a deep, gasping breath.

"Why did n't you answer that horn, you old vagabond?" continued the judge, with another vigorous shake and two or three resounding cuffs. "Tell me, or I'll mash every ultimate molecule in the tissues of your body!"

Rack dodged, grunted, and gasped again, getting his breath as a man who comes out of a plunge in cold water.

"Lost your tongue, have you?" the judge went on, still cuffing vigorously. "I'll stir up your nerve-cells and jar your ganglions into activity; I'll knock all your foramens into one; I'll make magma of you; I'll reduce you to protoplasmic pulp!"

The negro soon got himself together, and tore away from his master's grasp. His voice came to him at the same time, and it was no child's voice.

"Stop dat! stop dat!" he exclaimed, dodging meantime sundry blows and kicks. "Yo' do' know w'at yo' doin', Mars Spivey; 'fo' de Lor', yo' don'!"

But the judge did not stop until quite out of breath and otherwise exhausted. He had managed to hurt himself much more than he had punished the negro, and now, panting and glaring, he sank upon the stool, his grizzled beard quivering and his hat awry.

"I's pow'ful s'prise at yo', Mars Spivey; 'fo' Gor, I is," Rack remarked, wiping the perspiration from his face with his sleeve while, with his feet apart, he squared himself in front of the judge. "W'en yo' bu's in on dat ca'e'lation o' mine, yo' jes eberlastin' did play de berry debil wid er 'vestigation ob science, I tell yo'."

Judge Dillard's fiery eyes, still bent upon his servant's face, shot forth a queer gleam as Rack uttered the word "science." Probably if he had not been so very blown and tired he would have renewed his assault and battery; but the sheepskin stool, with its deep, soft fleece, was a restful seat.

"W'en yo' begin yo' wo'k onto me jes now," Rack went on, "er-thumpin' me ober de head, an' er-whangin' me in de face an' eyes, an' er-jerkin' de berry liver an' lights out'n me, I jes at dat time ready ter re'ch fo' a 'clusion in bi-orology, an' yo' knock it plumb frough me an' stomp it inter de ye'th."

By this time the judge had recovered himself somewhat, so that he recollected what it was that he wanted of Rack.

"You just biology off to the stable, and take Bald Eagle"—that was his saddle-horse—"over to the blacksmith's shop and have his shoes reset; and, Rack, the very next time that you go to sleep and don't hear my horn I'll take you down the country and sell you, see if I don't!" He delivered this order, set with the sting of the most terrible threat known to an up-country slave, in a tone which made Rack's soul shiver. The negro stood not on the manner of his going, but went forthwith to do the task assigned him.

Judge Dillard remained on the soft stool,

and, leaning his head against the cool bark of the mulberry tree, gazed idly up into the thick, dark foliage, now splashed with the soft purple of the ripening berries. His recent exertion and excitement had left him quite averse to further physical or mental effort; indeed, the reaction gradually engendered in him that dreamy, misty mood which in its soothing restfulness is next to sleep. A woodpecker, with a black jacket and a scarlet head, came and alighted on a corner of the cabin roof where a course projected. It eyed the judge a moment, then beat a fine rolling tattoo on the resonant end of a warped board. The sound was a peculiar one, double in its nature, the second or undertone being a strange, vibrant strain, sweet as the softest note of flute or violin. The judge's ears were in just the most receptive condition; the vague, sweet, ringing chord flowed in and thrilled throughout his senses. A mocking-bird had been flitting about in the mulberry tree overhead, and the judge noticed that it had the peculiar habit of fetching mulberries to a certain point on a stout bough, where it thrust them into a small pit or knot-hole, and, after churning them for a little while with its beak, drank their rich subacid juice. To the half-dreaming man of science observations of this nature were distantly suggestive. His lips moved, and he murmured, "Strange that while the harsh-voiced *melanerpes erythrocephalus* is drawing aboriginal music from a fragment of *pinus mitis*, the silver-tongued *minius polyglottus* is content to make cider from the insipid fruit of *morus rubra*." At the sound of his words both birds flew away as if terribly frightened.

The judge was a good-hearted man, though rather hasty-tempered, and when his calmer mind began to contemplate the treatment given Rack a while ago, a twinge of remorse shot through it. He recalled, with a vague sense of its extreme novelty, the fact that Rack had claimed, and with intense seriousness, that his lapse from duty had been owing to complete absorption in a scientific investigation. The judge chuckled heartily, then became grave, as the phases of the situation passed from ludicrous to pathetic. What if, after all, a negro could comprehend and follow the golden threads of biological study? What if he, Judge Spivey Dillard, jurist and scientist, had thumped and cuffed and pounded a man, black though he was and born slave, just at the moment when a mystery of life was beginning to make itself comprehensible to his understanding? The thought was heavy with suggestions over which the judge pondered deep and long; then he slept, leaning heavily against the tree, while the dry mountain air fanned his furrowed face and shook the grizzled beard that fringed his

lank jaws and protruding chin. Through his slumber fell the sweet bouquet of the luscious berries and the tender rustle of the broad leaves. The woodpecker returned again and again to sound a bar or two of his queer music on the old warped board, and the mocking-bird ventured back to the little pit wherein he churned his mulberries and made his fragrant wine.

Judge Dillard awoke just as Rack came shuffling down the path, returning from doing his errand. The old gentleman heard the familiar footfalls, rubbed his eyes, yawned, and stretched himself. Rack, lifting both hands and expanding his eyes dramatically, exclaimed:

"Well, 'fo' de Lor'! Mars Spivey, yo' loungin' roun' yer yit? Wha' gwine happen nex', I wonder? Been 'sleep all dis time?"

The judge yawned again, but he was eying Rack keenly, as if to look through and through him. The old slave noted this with misgiving, secretly fearing, indeed, that something was going to be said on the subject of a hand of fine leaf tobacco that he had surreptitiously abstracted from his master's store not long since; but the judge merely remarked that he had been feeling a trifle drowsy, and then added:

"Sit down there, Rack," indicating a corner of the porch-floor. "I want to interrogate you touching biology."

It would be tedious and quite uninstructional to insert here the long dialogue that ensued between the judge and his slave. The almost unpronounceable words, the Greek and Latin phrases, and the Darwinian quotations indulged in by the white man, were thoroughly equilibrated by the savage interpretation of them rendered by the negro. To say that Rack reveled in the conversation would be but a shadowy expression of the truth. Indeed, his enjoyment was ecstatic, even excruciating, as was proved by his bodily writhing and his facial contortions. For how many long years had he been furtively catching detached bits of his master's learning, growing hungrier and thirstier day by day for the full draught he was now taking in! Every precious word of the jargon of science caught by his ears had been held in the tenacious grip of his memory. He had crooned over them in the depth of the night;

he had sung them in the field; he had conned them while hunting the famous 'possum of the Ulufta valley, until they had entered into the innermost fibers of his life, so to speak, and been assimilated perfectly without being in the least digested.

Nor was Judge Spivey Dillard less charmed than his slave with the occasion current. He

"YO' DO' KNOW W'AT YO' DOIN'."

came near forgetting to ask Rack for further explanation of the alleged investigation which had led to the recent encounter; but he caught himself just in time. Rack was ready, nay eager, to enlighten his master.

"Well, sah, Mars Spivey," he began, crossing his index fingers in front of him, "dat wa' er ques'ion ob de ginerál aberage ob ci'cumstances; or, speakin' mo' pláiner, it wa' jes dis: what air de biorology ob er singin' boa'd, an' er mockin'-bird 'at feeds er mu'berry limb, an' er 'possum w'at kin go out, jes like er can'le w'en yo' blow it?"

The judge, more from long habit than from any desire to have this apparently absurd proposition simplified, straightened himself up a little and said:

"Repeat that statement, Rack."

"Ce'tainly, sah, ce'tainly; I gwine mek it reas'n'ble ter yo' gum'tion, 'migety, sah," responded the negro, lifting one forefinger and tapping the other with it. "It 's dis yer way: dey 's er dry old boa'd 'at kin sing er chune; dey 's er mockin'-bird w'at feeds er mu'berry

limb; an' dey's er wollo-pin' great big old 'possum 'at kin jes fade right out an' tu'n hese'f inter nothin' w'ile yo' 's er-lookin' at 'im. Dat 's w'at I done been er-'vestigatin' w'en yo' try ter tah me all ter pieces dis mo'nin'; an' jes as yo' light ont'er me I was er-'jinin' dem fac's tergedder an' jes er-re'chin' out fo' de aberage ob 'm. Mighty sorry yo' do dat, Mars Spivey; it gwine ter be'er great loss ter biorology, sah, sho 's yo' bo'n, sah."

The judge was disgusted in one sense, and in another he was, strange to say, deeply interested. He was curious to know just what Rack meant by a singing-board, a mocking-bird that fed a mulberry limb, and a 'possum that could render itself invisible at will. Pursuing this curiosity, he catechized the negro after the artful manner of a lawyer to the business born. Rack was slow to give up his secret, but, bit by bit, the judge drew out the whole of it. The singing-board was the one in the cabin's roof upon which the woodpecker beat its long roll in the morning. The under-hum of that sonorous piece of wood was still softly reverberating in the judge's ears. The mocking-bird that fed the limb was the one that the judge himself had seen churning mulberries to pulp in the opening on the bough overhead; but the 'possum that could fade out and disappear had been met by no man save Rack. And what a 'possum it was!—as large as a six-months'-old pig, with a tail quite a yard long, and a nose that turned up almost at right angles. Time and again Rack had come upon this magnificent animal down in the Ulufta bottoms, where the timber was thick and heavy; but he could by no art known to the 'possum-hunter capture it, for the reason that it invariably faded away to nothing, as ghosts are said to

JUDGE DILLARD.

do, leaving only a faint, wan light flickering for a moment where it had been.

Somehow when Rack, in his simple dialect, related how for more than twenty years he had lain in his lowly bed of mornings listening to the strange, sweet vibrations of that singing-board; and how for the same period, during every year's mulberry season, he had watched the mocking-bird stuff the fruit into the hole in that limb; and, more than all, how for a score of autumns and winters he had used every means at command to capture that wonderful 'possum, it got the judge's imagination aroused and set his memory to work. His long-lost youth brought up a host of experiences left fifty years behind, and among them hunting

the 'possum was perhaps the raciest and most barbaric. Those were the days when a persimmon had exquisite flavor, and when muscadines were better than any garden grape. For a while he tasted over again the far-away sweets of boyhood; smelt the keen fragrance; saw the gay colors; heard the ravishing sounds; felt the thrill of vigorous, buoyant, untainted life. Elusive, pungent reminiscences came in and wandered through his mind like bees through an old weed-grown flower-bed.

"Yes, sah, yo' busted up er powerfu' close ca'c'lation by yo' onreason'ble savagerousness dis mo'nin', Mars Spivey," insisted Rack, shaking his head dolefully, and ending with a long, deep sigh of regret. "Yo' onj'inted my 'magination."

This touched the judge, for at the moment he was fixing one of those shadowy half-remembrances. Surely it was so—yes, it was so—he vaguely recollected it—yes, once, long years ago, an opossum had disappeared mysteriously right before his eyes. The animal was at the time hanging by its tail to the low, full-fruited bough of a persimmon tree; he approached it with a club, when, lo! it faded away and was gone. Now he described the incident to Rack, who received it with delight, and from that day forward the two men discussed at intervals the possibility of a marsupial's having the power of self-elimination under great stress of danger. For some time the negro was chiefly a listener, while his master, seated in a deep chair on the stoop of the mansion, dilated with much show of learning upon the isolated position of the opossum family in the animal kingdom. The judge had a theory of his own, to the effect that a 'possum represented humor of a more or less comic sort, and he explained to Rack that it was the 'possum-eating habit among the negroes of the South which had given them their sense of barbaric comedy and their love of humorous music.

"It is nothing in the world but 'possum-fat," said he, with learned gravity; "nothing but 'possum-fat that has made such idiots of you niggers. It makes your heads wag, and your hands pat, and your feet dance; it makes you laugh at everything, and act the fool generally. In short, Rack, 'possum-fat is the essential oil of tomfoolery and buffoonery and absurd comicality."

But Rack was longing for a scientific explanation of the singing-board and the limb-feeding mocking-bird.

"But there is no correlation between these simple things and the opossum question; no correlation whatever, Rack," the judge explained.

"But I say dey is," asserted Rack, with

a vehemence that fairly startled his master. "Dey is er corroliation, so dey is, an' dat jes w'a' I gwine show yo' w'en yo' try tah me up."

"Rack, I say to you that there is no correlation whatever," replied the judge.

"Dey is, dey is, I tell yo'," retorted Rack.

The judge reached for his cane, and the negro bolted away, as if shot from a war-wolf, his big flat feet pounding the path with rapid and resounding strokes until the cabin was reached.

Rack's memory was remarkable. He kept in mind the 'possum theory advanced by his master, and it grew upon him day by day, apropos of which he went about singing the old quatrain:

W'en de ole 'possum gwine ter run,
His hide jes nat'ly bu'st wid fun;
Ef nigger knock 'im on de head,
He still keep grinnin' w'en he dead!

Many times the same question arose as to the possibility of a correlation between the singing-board, the mocking-bird that fed the mulberry limb, and the opossum that could disappear at will; but the disagreement of master and slave was, it appeared, insurmountable. The judge finally formulated his proposition thus: "There cannot possibly exist any correlation whatever between a self-eliminating *didelphys virginiana*, a berry-eating *mimus polyglottus*, and a dry fragment of *pinus mitis* struck by the mandibles of *melanerpes erythrocephalus*."

Rack was staggered, but he shook his head doggedly, and responded with exasperating brevity, "I say dey is."

From the very nature of things it came to pass that this problem in science occupied every moment of Rack's gradually increasing leisure. To solve it, and so triumph over his master, would be a crowning glory. The nebulous beginning of a solution was, in fact, forming itself like a milky way across his mind. The judge himself was so keenly pleased with his old slave's mysterious ambition that he almost wished to see him succeed, even if it should appear thereby that color had won at precisely the point where color always had been supposed to be weakest. Rack's enthusiasm and zeal were tempered all the time with such grotesque and comical humor, and accompanied with facial contortions so expressive of savage wisdom, that a kind of infection exhaled therefrom and insinuated itself into the judge's imagination.

As time flew on—and how it does fly as the evening of life draws towards night!—Rack, while growing more and more confident of success, became very reticent as to the progress of his investigations. Finally the judge became

aware that something of a secret nature was in progress down at the cabin. He questioned Rack on the subject, but received no satisfaction, and when he threatened and menaced the old fellow he was reminded that a most inopportune assault once before had delayed the great investigation.

"Cou'se you kin jump on ter me an' w'ar me out, Mars Spivey," said he dolefully and with a lugubrious twist of his strong African face, "but ef yo' does it 's gwine set biorology back jes fifteen yeahs an' fo' days mo'; sho 's you 's borned, Mars Spivey, dat 's w'at it 's er-gwine ter do. Jes fifteen yeahs an' fo' days mo'."

"But, Rack, what upon earth is your objec-

tantalized and delighted, while the days flew by like birds before a storm.

Year followed year, bringing no notable changes in the dry, stony mountain landscape. The dessicative influence of the climate preserved things *in statu quo*. At length the great war came on; it rolled its heavy echoes over the blue peaks to the north and west of them, but neither master nor slave heeded them much; peace came, and with it freedom; but the tie that bound these two old men together was stronger than the proclamation of a President or any amendment to the American Constitution. They became more and more attached to each other, the negro in the latter years gradually assuming the stronger part,

"OH, LO'DY MASSY, HOW D' YO' FEEL?" (PAGE 914.)

tion to telling me?" demanded the judge, with querulous and helpless insistence.

Rack looked sidewise at his master, with a suspicious and over-cunning leer in his milky old eyes.

"Da' now, Mars Spivey," he said, chuckling in a low falsetto—"da' now, yo' know jes es well es I does dat it not gwine ter do fo' one scientist ter tell 'nodder scientist any ob his disciberies afo' he git 'em fastened solid in he mind, er he steal 'em sho 's yo' borned. Don't yo' ricomember w'en yo' read ter me in de book 'bout seberal 'markable ins'ances ob dat sort er misplace co'fidence? Ya', sah, yo' did, Mars Spivey. Now den, yo' 's er scientist, ain't yo'? Well, I is too, an' I jes know mighty well what yo' 'd do. Yo' 'd steal my discibery, an' jes tu'n roun' an' sw'ar 'at it 's yo'n! No, sah, Mars Spivey, yo' don' come dat game. I 's not quite er eejit yit!"

Rack had his way, and the judge was both

while the judge, whose mind and body, weakening together, appeared to be slowly drying up, gave most of his time to watching the tedious progress of Rack's investigation.

It was one fine morning in December, 1865. The previous night had been a clear, sharp, frosty one, crisping the late greenery of the sturdy mountain oaks and making mellow and luscious the persimmons of the Ulufta valley. The judge was on his veranda, smoking his pipe in the sunshine, and enjoying the soft color show set against the steep slope of the Hog Back, when Rack shambled up the steps and began dancing on the floor, his heavy shoes making a mighty racket.

"I 's got ter de eend! I 's got ter de eend!" he sang out. "I done 'sciber de corroliation ob de boa'd an' de mockin'-bird an' de 'possum, an' I done settle de 'vestigation, Mars Spivey; ef I hain't, den de debil 's er co'n-dodger!"

Before the judge could recover from the surprise of the occasion, Rack changed the step of his dance to a fluttering and rattling double-shuffle as an accompaniment in counterpoint to the following snatch of song:

De mockin'-bird fink it smart o' him
W'en he hide he music in de limb!
Oh, ya, ya, ya!
An' er wha, wha, wha!
W'en he stuff he chunes all in de limb.

Dat pine boad sing till it wa'p right roun',
An' eb'ry day it ketch mo' soun'.
Oh, ya, ya, ya!
An' er wha, wha, wha!
Fo' eb'ry day it ketch mo' soun'!

De 'possum gwine ter shed he skin,
An' den de music will begin.
Oh, ya, ya, ya!
An' er wha, wha, wha!
W'en dat ole 'possum shed he skin!

He ended with a high fling and a tremendous foot-stroke on the resounding floor. The judge remonstrated and even tried the old worn threats, but Rack would not be controlled.

"I done cotch onter de corroliation ob de biorology!" he cried exultingly, still skipping about. "Dat man Dahwin, he plumb dead right eb'ry time on de biorology an' devolution. It gwine ter be er cl'ar case ob nat'ral dejection an' de 'vival ob de fited! It gwine ter be er cla'r case ob devolution f'om de gin'al ter de specification, f'om de simple ter de confound! Free of de simplest an' no 'countest gineralst fings in de worl' gwine ter be devoluted inter de one confoundest specialst best t'ing 'at eber yo' see in all yo' bo'n days!"

Here he caught the double-shuffle again, and added to it what was known as the chicken-peck back-step.

"I kill dat ole 'possum las' night," he added in a calmer way, though he was panting heavily. "Hi! 'fo' Gor, I jes knock 'im lim'er wid er light-'ood knot, an' skin 'im afore he done kickin'. Bless yo' life, Mars Spivey, but dat 's de bigges' 'possum-skin dis yer chile eber see in he whole bo'n days. Look mos' like er calfhide er-hangin' down dah on my doo'."

A few days after this the judge was surprised to discover that Rack had climbed up in the mulberry tree and cut off the famous limb which had been fed for so many fruitful summers by the mocking-bird. The resonant board, too, had been removed from the cabin's roof.

Now came the six long years of patient labor by which Rack Dillard reached the goal of his soul's ambition. First he hung a section of the mulberry limb, about three feet long,

close to the jamb of his fireplace to season, and then he began with a piece of glass scraping thinner the old warped board. Meantime the opossum's skin was lying under a bed of hickory ashes, which sooner or later would deprive it of its hair.

Day after day, through the seasons and the years, the old judge found his chief pleasure in sitting with his pipe in his mouth, watching Rack scrape and file and cut and carve the singing-board and the full-fed mulberry billet, or manipulate the pale, translucent hide of the opossum.

"I 'll jes show yo' 'bout de corroliation ob dem fings, Mars Spivey," the negro would mutter, without lifting his bleared and sunken eyes. "Yo' said dey was n't no corroliation 'tween 'em, an' I said dey was. Pooty soon we see who gwine be right 'bout dis yer biorology question, so we will."

The singing-board proved to be a singularly even-fibered piece of pine three feet long and four inches wide by a half-inch thick. For about fifty years it had lain in the cabin roof absorbing the warmth of the sun and the drying sweetness of the mountain wind. Slowly its tissue had been granulated and rearranged under the daily jarring of the woodpecker's bill, until now, after the scraping and polishing Rack had given it, the wood had an amber, waxen appearance, and was as flexible and sonorous as the finest tempered steel. But the mulberry billet! Never was there another such a bit of color, fragrance, and fineness. From the gnarled little pit, in which for fifty years the mocking-bird had brewed his purple wine, the rich stain of the berries had spread through the wood in a waving, rippling flood, giving it a royal dye and a fruity, musty odor like the bouquet of old wine.

Near the close of the six-years' period mentioned a while ago, Rack, on the lookout for his master's daily visit, met the judge at the cabin door and remarked:

"Bleegeed ter say ter yo', Mars Spivey, 'at yo' 's not welcome ter-day. Yo' got no business down yer nohow."

The judge was taken by surprise. He leaned on his staff and looked quizzically into the old negro's face. Rack did not relent.

"Yo' 's not gwine inside er dat cabin dis day," he persisted, "ca'se I 's got ter hab de room all ter myse'f. I 's er-gittin' ter de corroliation w'at we been er-sputin' erbout, an' I 's jes eberlastin'ly er-knockin' de holy stuffin' out'n all yo' ram'fications on de biorology. So yo' kin jes go back, honey, an' wait tell I come fo' yo'. No, I 's not gwine come fo' yo' nudder; yo' jes come yo' own se'f, nex' Sat'd'y night. Yo' heah, now? Nex' Sat'd'y night I 'll be ready fo' yo'."

The judge turned about slowly and reluctantly; leaned a moment on his cane; faltered when he tried to say something; then trudged back to his own veranda, where he smoked and dozed in his easy chair. Recently his age had been softening his feelings. An hysterical sentimentality had gained upon him. Rack's refusal to confide in him had worn upon him day by day for years, and now he felt, however indefinitely, that the last straw of ingratitude had been heaped upon him. Nevertheless he waited patiently for Saturday evening to come, with but the slightest and vaguest sense of the olden-time arrogance which would have resented the merest suggestion of such an act. This supremacy gained over his lifelong master was, it seems to me, the highest evidence of Rack Dillard's genius.

When Saturday afternoon faded at last into twilight, which in turn slowly softened into a moonlit night, the judge began to make some preliminary movements with a view to visiting the cabin; but he lingered, cane in hand and pipe in mouth, at the little gate before his house, hesitating for no particular reason. It was midsummer, and the dry softness of the mountain air touched tenderly the dreaming, dusky leaf-masses of the woods and hung misty veils on the peaks that notched the horizon. He presently crept through the gate, hesitating just outside for a while, and gazing up at the stars and the moon. It was his way of restraining his impatience, and besides he had not been quite able to forgive Rack. He toddled along the path, fitfully pausing here and there, until at last he turned the corner of the rock. At the cabin porch he stopped short and stood in a hearkening attitude, amazed at first and then entranced. The little house was full of music that rippled out through every opening and tinkled away in thin rills along the dim paths of the woods. The judge remembered that in his young days Rack had been a musician of no mean ability, but for years he had had no instrument to play upon. Evidently he was now making up for lost time; and what music! Was ever anything else so mirthful and yet so burdened with pathos? So barbaric, still so refined? So brimming with virile force, so tender, so touching, so hilarious, so comic, so sweet, so true? The old judge felt the hot tears gush up into his eyes, he knew not why. It was as if the old times of his boyhood had blown their sweets back upon him, with the laughter of childhood, the patter and shuffle of dancing feet, the songs of myriad mocking-birds, the rustle of satin leaves and silken wings, the bubble and bouquet of purple wine, the fragrance and resonance of all the sweet, dry, sun-seasoned wood that ever was wrought into violin or harp.

He stood there crying and laughing, keeping time with his staff and wagging his head, now slowly, now briskly, as the strains varied from grave to gay.

Oh, de peckerwood he head er red,
Lolly, lally, ho!

came forth Rack's voice, rich and strong despite old age, singing to a well-timed accompaniment and the pat, pat, pat of his heavy shoe.

Oh, de peckerwood he head er red,
Lolly, lally, ho!
An' de mockin'-bird he been stall-fed,
Lolly, lally, ho!

Oh, de 'possum am er funny t'ing,
Lolly, lally, ho!
W'en he lif' 'is foot fo' de pigeon-wing,
Lolly, lally, ho.

De pine boa'd set my notion gwine,
Lolly, lally, ho!
An' de mulberry limb it mighty fine,
Lolly, lally, ho!

The judge could bear it no longer. He pushed open the door and went in. Rack looked up and nodded, but kept on singing and playing, emphasizing his notes more than ever, if that were possible. Judge Dillard began to dance, and even to sing:

Oh, lo'dy massy, how d' yo' feel,
Wid de 'possum grease down in yo' heel,
An' yo' head all full o' turnip pie,
An' er big sweet 'tater in yo' eye?

The negro's voice ceased when the judge's began, but the banjo, catching the new air, rang on in jolly unison. Who would have thought that an octogenarian could ever have danced like that!

Wash yo' teef wid de blackin'-brush,
Grease yo' ha'r in er pot er mush,
Go to de dance er Sat'd'y night,
Patrol whop yo' 'fo' daylight!

The black had conquered the white. When the judge sank at last into a chair he was exhausted, panting, sweating, his heart beating violently. Rack keyed one string up a trifle, leaned a little farther over, and began to sing plaintively:

Marster, now we 's growin' ole,
De heads am white, de feet am cole,
But de ole, ole age cayn't do no harm
W'en de heart, de heart am true an' warm.

Marster, w'en we drop ter sleep,
In de grave so cool an' deep,
Den we nebber feel de storm,
Ef our po' ole hearts is warm.

They sat up all night long, now singing,

now dancing, anon talking over the old times on the Ulufta. Something in the music of that banjo had an intoxicating effect. Judge Dillard felt fifty years younger, and Rack found it not in the least difficult or tiresome to play for an hour at a time without a moment's rest. The exquisite odor of the pine wood touched the air in the room, and there was a distinct flavor of ripe mulberries straying elusively about.

WHEN I visited Rack's cabin I examined with great care and interest the incomparable banjo which the negro's patient genius had built out of the "singing-board, the over-fed mulberry limb, and the skin of the famous Ulufta 'possum," as the thrifty Yankee proprietor describes it. No one can doubt that science and art were happily married in the making of that superb instrument. A glance shows that the carving, the proportions of the parts, and the fine details of the finishing—from the silvery, translucent skin that covers the head, to the rich purple of the mulberry neck, and the gold-colored hoop fashioned out of the old warped board that had sung so long in the cabin roof—are exquisite beyond description. On the under part of the neck is the only authentic autograph left by Rack Dillard. It is a legible carved inscription of four words: "Dis is de corroliation."

Rack's grave is on the top of the high cliff above his cabin. It overlooks the lovely valley of the Ulufta, and commands a fine view of the Hog Back. To this high tomb of

the great negro originator of true dialect romance and minstrelsy have come, as pilgrims to a shrine, many faithful and devoted students to pay their respects to the founder of their school. Wreaths of flowers are laid tenderly on the mound, and in the bold escarpment of the rock are cut ineffaceably some names beloved of all men. Among these, and high in the list, I noticed with peculiar pleasure Joel Chandler Harris, H. S. Edwards, Thomas Nelson Page, and Irwin Russell—the names of men whose stories and songs and sketches have made known to the world the tender, faithful heart, the rich, sunny humor, and the deeper soul qualities of the Southern negro. I hesitated a while; then where no one would be apt to see it, I scrawled my own signature to testify that I too had been there.

Rack must have been a genius, a high type of his race. As in the case of every other genius, he foresaid or forecast the life that was to come after him, while at the same time he was the exponent of the past. His songs and his banjo strains left in the brisk, sweet air of the New South a lasting reminder of the old plantation days. The years he spent so patiently in establishing a close relationship among his materials, and which drew together the three elements of his art, fun, pathos, and music, have served well the civilization of our time, and have added a distinct tint and a new flavor to life. We owe a great deal to Rack Dillard. Peace to his ashes!

Maurice Thompson.

THE NON-IRRIGABLE LANDS OF THE ARID REGION.

BY THE DIRECTOR OF THE UNITED STATES GEOLOGICAL SURVEY.

SUN is the father of Cloud.

Cloud is the mother of Rain.

Sun is the ruler of Wind.

Wind is the ruler of Rain.

Fire is the enemy of Forest.

Water is the enemy of Fire.

Wind feeds Forest, and

Rain gives it drink.

Wind joins with Fire to destroy Forest.

Constant Rain battles with fickle Wind and mad Fire to protect Forest.

So Climate decks the land with Forest.

There are very large areas of the world unclad with forests, but this is not for lack of rain. Forests, low, gnarled, thorny, and scant, will grow with even less than ten inches of annual precipitation. Such are the forests of sunny Arizona. As the rainfall increases from clime

to clime, the forests become more luxuriant, stately, and dense, until with sixty inches of rainfall a growth is produced which almost baffles description. Then giants crowd one another and lift their heads higher and higher in rivalry to bathe their verdant crowns in sunlight. High and straight towards the heavens they thrust their boles, and their boughs push towards the zenith by the shortest way of verticality. The young trees also are slender and straight, and depend on the giants for protection against overthrowing blasts. Around the feet of the giants is a dense undergrowth. But old trees die and fall, and their great stems lie on the ground or are held above it by large branches. Through this warp of living and dead trees there is a woof of vines, climbing the trees, running out on the branches, creeping over logs, and stretching from tree to tree,

branch to branch, and log to log, all woven into a mass of vegetation. Thus the erect and creeping living and the prone and prostrate dead constitute a forest tangle into which man can penetrate only with the greatest toil. Such are the forests that stand about stormy Puget Sound.

Between these extremes there are many degrees of luxuriance in tree growth. When a region is reached with less than forty inches of rainfall small prairies may sometimes be found, and passing on to regions of still less rain the prairies are larger and more frequent. When districts of about thirty inches of rainfall are reached prairie predominates, and the few and smaller forests are called groves. Still passing to zones of less precipitation the prairies become plains, and such forest growth as may be found is mainly ranged along the river banks or scattered over stony hills.

If there were no intervening agency, climate would cover the earth with trees wherever there is more than ten inches of rain. This agency is fire. Rainfall, then, furnishes the potential limit to forest growth, fire the actual limit. On the other hand, rainfall furnishes a limit to fire in such a manner that it becomes less and less destructive, until, under mean conditions of latitude and altitude, forty inches of yearly rain establishes a practical limit to its ravages. In a region where prairie and grove divide the land between them, fire and storm are evenly matched. Fire is king on the plains; storm rules where the forest stands.

The arid lands of the United States are chiefly without trees, although the rainfall is sufficient for their production except in desert areas of Arizona and California; but fire prevents their development or destroys them after they are grown. Still, some areas of the country are wooded. Along the streams grow cottonwoods of value for firewood and for minor domestic purposes. On elevated mesas or table-lands, and on lofty hills, are scant forests, consisting mainly of low, straggling piñons, or nut pines, dwarfed and gnarly cedars, and ragged and deformed oaks. These forests do not furnish milling timber, but they are useful for fuel and for many other purposes. On the higher plateaus and mountains great forests are found, composed of pines of many species, spruces, hemlocks, firs, and sequoias. The timber trees are all coniferous and needle-leaved. The oaks are but bushes, often Lilliputian. Some of the oaks of arid Texas vainly vie with the goldenrods of Illinois; while the cactus plants of the Prairie State would look up with wonder to the cactus plants of Arizona, as pygmies gaze on giants. The oaks of the foothills along the western slope of the Sierras in California attain a greater size, and become orchards of acorns, where Indian hunters and grizzly bears

were wont to compete for food in the days when the soil was unscarred by the miner's pick. The forests of the plateaus are not dense, though the trees are stately, and the lands are often variegated with brilliant chaparral and blooming prairie.

The mountains are not uniformly clothed with woods, but here is a grove of pine, there one of spruce, hemlock, or fir. Often these trees are commingled, and in the Sierras of California sequoias stand above them all. By the streams and in the mountain glades silver-stemmed aspens abound, whose wealth of foliage turns to gold when the autumn rime appears. Sometimes a driving wind sweeps through such an aspen grove and brushes the leaves from their twigs, and they float on the air like a cloud of butterflies, resplendent in the brilliant sun of a cloudless sky. Many a mountain side is naked, and many a peak is lifted above the timber line into the region of snow and ice.

We mount our horses at Flagstaff in northern Arizona. In ten minutes we are in the woods and out of sight of the railroad town. We ride for hours among the pines, and from time to time see San Francisco Mountain on our right. Here and there, as we go, a black cinder-cone is lifted for a few hundred feet, aspen groves are seen, and at noon we ride up the slope of a low, dead volcano, and, passing a rim of crunching cinder, halt on the shore of a lakelet in a crater. Then on we ride through an open pine forest, until at last we come down to hills that are covered with piñons and cedars, and rest for the night by a spring concealed among oak bushes. It has been a long ride, and we sleep well. Before the morning sun illumines the hilltop we are on our way again — still to the north, across sagebrush plains and cedar-clad hills; by noon we are once more on the verge of a pine forest, and we lunch by a water-pocket that was filled by a storm two months ago. Then our way is across glades carpeted with flowers, and through open forests where we now and then see a deer bounding on its way. So we pass over prairie and through pine forest until at last we reach the brink of the Grand Cañon of the Colorado. When the days of wonder-seeing are past, we turn to the southwest, riding through forest and across prairie. At intervals of twenty or thirty miles we find a spring or a water-pocket. And so we journey, day by day and week by week, over prairies, through forests, and among cinder-cones and dead volcanoes, glad to find a water-pocket after a long ride and supremely happy to camp by a living spring. But no creek, no river, is ever found. Such is one of the great forest-clad plateaus of the arid region.

Our steeds are now psychic, and we amble through air to Middle Park in Colorado, and camp at the foot of a mountain. Near by rolls Grand River, and there by the rock is a fountain whose waters come from unknown depths, where they have been heated in the caldron of eternal fire. From the boiling waters a cloud of steam arises, loaded with sulphurous odors, and a pellucid brook flows over a carpet of brilliant *conservæ* on its way to the river. When morning comes again we continue our ride on terra firma, among hills and then among mountains. Now and then we come to a stream where our horses must swim, and we wade creeks and leap over brooks until we plunge again into forests beset with fallen timber.

At noon we camp on the margin of Grand Lake, here bordered with stately forests, there walled with precipitous rocks. True, the distance is great for a morning ride, but our chargers are the best—why not? They are imagination-bought, and we have wealth of fancy. For the afternoon we plunge into a dead forest where a fire played havoc ten years ago. Some trees are prostrate and obstruct the way. Falling trees have caught in the branches of those still standing, and lean here and there with varied angles. Trees supported by others, trees prostrate and trees erect, naked white trees with naked white arms, are woven into a maze of ghostly bars to block our way. Over and under and around we pursue our course. Then a storm comes on. The wind sweeps through this ancient battlefield of fire and storm, and the stark, dead limbs crack, break, and crash on the ground. Now and then a great stricken tree falls and fills the air with a roar which vies with the thunder. Dead trees caught in the arms of dead trees sway and shriek, and the tempest runs mad with wild delight. We stand on open ground and gaze on the destruction and listen to the battle-music of nature. When the storm has passed we ride along until live woods are reached, and at night camp where a mountain rill lulls us to sleep. So for days and weeks we ride through dead forests and live forests, and everywhere in the mountains we find rivers, creeks, brooks, springs, and lakes. Such are the forests of the Rocky Mountains.

Once more, on steeds as swift as dancing light, we enter a grove of live-oaks in the valley of California. Where other trees have curves, these have angles; they are all knees and elbows, and they stand akimbo with knotted fists. But, as if to hide deformity, they are covered with a mantle of perennial green. Now we ride over meadows of green and hills of gold until more symmetric oaks and cedars are found; blue pines are seen, and at night we reach the great sugar pines of the Sierra.

Then we slowly climb the long, gentle slope to the west. Cedars like those of Lebanon on every hand, pines like those on Norwegian hills, and at last we see a sequoia, the grandfather of trees. Past the big trees, we next day find forest and chaparral contending for the land. The woods are of pines and spruces and firs, and the chaparral is brilliant with the scarlet boughs of manzanita and gnarled mountain mahogany. High up the mountain we climb, and the pines are lost, the spruces disappear, and the firs are dwarfed, until we are among domes of gray granite and pinnacles of trachyte, and down into a vast amphitheater of sheer rock comes a creeping glacier. So on we ride from day to day, week to week, and month to month, from dwarfed fir above to dwarfed oak below, and again from foothill to granite dome, until we have crossed all the rivers that flow from the Sierras and unite to pass through the Golden Gate. During this ride we have seen the great Sierra forest.

For a number of years a survey of the arid lands has been in progress, and the forest areas have been mapped, and they have all been studied more or less. Now surveys are mathematical, for relations of quantity are involved. Numbers perhaps are more arid than land, and hence they are appropriate here. Glance at the following table, and some idea will be obtained of the comparative extent of the forests of which I have spoken.

Approximate Area in Square Miles of Timbered Lands in the Arid Region.

State.	Firewood. Sq. Miles.	Merchant- able Timber. Sq. Miles.
Washington.....	1,050 ..	1,080
Idaho.....	8,600 ..	9,800
Montana.....	6,500 ..	21,000
Oregon.....	3,500 ..	8,700
Wyoming.....	7,300 ..	15,700
South Dakota.....	2,400 ..	400
N. Dakota (river bottoms) ..	200
California.....	20,300 ..	11,000
Nevada.....	5,400 ..	700
Arizona.....	26,510 ..	11,700
New Mexico.....	21,540 ..	14,490
Colorado.....	15,000 ..	23,500
Utah.....	14,000 ..	7,700
Totals.....	132,300 ..	125,770
	125,770	

Grand total..... 258,070

Total area of arid lands, 1,331,151 square miles.

It will appear from the above table that about one-tenth of the arid region is covered with firewood timber, but this timber is very scant, and often the open spaces are large. It could all stand on one-fiftieth of the entire arid area and not be crowded. The milling timber also covers about another tenth of the ground, but there are many barren places, and usually the trees are widely scattered, so that they could

MAP OF THE FOREST LANDS OF THE ARID REGION.

all stand on one-fortieth of the space and still have abundant room. So both classes combined could easily stand on less than one-twentieth of the arid region.

The merchantable timber is all on the high plateaus and mountains; hence the lands where it grows are not valuable for agricultural purposes. Cañon walls, cliffs, crags, and rocky steeps are not attractive farming-grounds. But more: at these great altitudes deep snows fall, ice appears early and lingers long, and frosts come on many a summer night.

The agricultural lands are situate in the valleys where the streams flow. Thus forest and farm are dissevered by dozens and scores of miles. So forest industries are segregated in one region, farming industries in another. It is no small task for the farmer and the villager to haul their wood from distant mountains and to bring poles and logs from the upper region, for it is a day's or a week's journey, and roads must be made over hills and along mountain sides. In many places flumes are constructed—great canals in lumber troughs that stand on

trestles, into which creeks are turned, and the lumber is floated down to the habitations of man. Then railroads and tramways are constructed for the same purpose. Often "slides" are built by arranging two parallel lines of logs down the mountain side, between which the timber glides. It is thus that the valleys are dependent on the mountains through the agency of a special lumber industry.

The miners are also interested in these forests. As they penetrate with their shafts, drifts, and galleries into the hills and mountains, they carry away to the surface the rock in which the gold, silver, copper, and lead are found, that the metals may be extracted on the ground above. Then they are compelled to support the overhanging walls, that they may not crumble down. When great depths are reached, the enormous weight of superincumbent mountain squeezes the floors of these galleries and causes them to creep up. To prevent crumbling from above and creeping from below the underground spaces are densely propped with timbers; so thousands and mil-

lions of cords of wood are used underground. The forests are also valuable for fuel in metallurgic processes, and to furnish the power necessary for running mining machinery. Many of these mines are in the mountains, and the timber grows near by; sometimes it grows far away, and must be hauled or transported by rail or flume to the mines where it is needed. So the mining operations largely depend on the forests.

More than two decades ago I was camped in a forest of the Rocky Mountains. The night was arched with the gloom of snow-cloud; so I kindled a fire at the trunk of a great pine, and in the chill of the evening gazed at its welcome flame. Soon I saw it mount, climbing the trunk, crawling out along the branches, igniting the rough bark, kindling the cones, and setting fire to the needles, until in a few minutes the great forest pine was all one pyramid of flame, which illumined a temple in the wilderness domed by a starless night. Sparks and flakes of fire were borne by the wind to other trees, and the forest was ablaze. On it spread, and the lingering storm came not to extinguish it. Gradually the crackling and roaring of the fire became terrific. Limbs fell with a crash, trees tottered and were thrown prostrate; the noise of falling timber was echoed from rocks and cliffs; and here, there, everywhere, rolling clouds of smoke were starred with burning cinders. On it swept for miles and scores of miles, from day to day, until more timber was destroyed than has been used by the people of Colorado for the last ten years.

I have witnessed more than a dozen fires in Colorado, each one of which was like that described. Compared with the trees destroyed by fire, those used by man sink into insignificance. Some years ago I mapped the forests of Utah, and found that about one-half had been thus consumed since the occupation of the country by civilized man. So the fires rage, now here, now there, throughout the Rocky Mountains and through the Sierras and the Cascades. They are so frequent and of such vast proportions that the surveyors of the land who extend the system of triangulation over the mountains often find their work impeded or wholly obstructed by clouds of smoke. A haze of gloom envelops the mountain land and conceals from the eye every distant feature. Through it the rays of the sun can scarcely penetrate, and its dull red orb is powerless to illumine the landscape.

During last season I made a trip over the arid lands by rail. On the way through the Dakotas the landscape was covered with a veil through which it was as vain to peer as through a fog at sea. On we went, meandering through the cañons and among the great ranges of

Montana, but the smoke covered all the landscape of mountain forms, and for aught that could be seen we might as well have been crossing featureless plains. Then we passed through Washington and Oregon and down through Idaho—ever in a mountain land, and never a mountain in sight. As we crossed the line into Utah a shower came and cleared the atmosphere, and behold! the Wasatch Mountains were in view; a great façade of storm-carved rocks beetled above the desert as proud as if they were not doomed to be destroyed by storms and buried low in the valleys by rivers.

It is thus that, under conditions of civilization, the great forests of the arid lands are being swept from the mountains and plateaus. Before the white man came the natives systematically burned over the forest lands with each recurrent year as one of their great hunting economies. By this process little destruction of timber was accomplished; but, protected by civilized men, forests are rapidly disappearing. The needles, cones, and brush, together with the leaves of grass and shrubs below, accumulate when not burned annually. New deposits are made from year to year, until the ground is covered with a thick mantle of inflammable material. Then a spark is dropped, a fire is accidentally or purposely kindled, and the flames have abundant food.

There is a practical method by which the forests can be preserved. All of the forest areas that are not dense have some value for pasturage purposes. Grasses grow well in the open grounds, and to some extent among the trees. If herds and flocks crop these grasses, and trample the leaves and cones into the ground, and make many trails through the woods, they destroy the conditions most favorable to the spread of fire. But if the pasturage is crowded, the young growth is destroyed and the forests are not properly replenished by a new generation of trees. The wooded grounds that are too dense for pasturage should be annually burned over at a time when the inflammable materials are not too dry, so that there may be no danger of great conflagration.

The area of good timber being very small, it has great value, and its rapid destruction is a calamity that cannot well be overestimated. These living forests are always a delight, for in beauty and grandeur they are unexcelled; but dead forests present scenes of desolation that fill the soul with sadness. The vast destruction of values, together with the enormous ravishment of beauty, have for years enlisted the sympathy of intelligent men. Forestry organizations have been formed; conventions have been held; publicists have discussed the subject; and there is a universal sentiment in

the West, and a growing opinion in the East, that measures should be taken by the General Government for the protection of the forests. This subject is of profound interest; but sometimes factitious reasons are given which detract from the argument for the preservation of the woods.

In humid lands, where rivers flow on to the sea because they are not needed on the fields, the problems relating to the streams are of another character. There the floods are destructive, and every condition which favors their diminution is an advantage. Vegetation lives on water. The roots drink it, and the leaves return all that is unused to the air, where it may float away to form clouds in other regions. A vigorous plant will thus evaporate two or three hundred times the weight of its annual growth. Then a great tree spreads, through the agency of its leaves and branches, a vast surface to the air and the heat of the sun. Altogether no inconsiderable portion of the precipitation of a region is thus returned to the heavens, and so fails to find the rivers. The subject has been more or less studied, but it is complex, and the result cannot be simply stated, for the variables are many. Perhaps it is safe to say that from twenty to forty per cent. of the rainfall of a region may be dissipated in this manner. It is manifest that such a loss from the streams is of no small importance in a humid region, and it is for this reason that the preservation of mountain forests in such lands is often strongly urged. But when the streams have a value which increases with their volume, the economic aspect of the problem is at once reversed. Researches on this subject made in the Wasatch Mountains and elsewhere by scientific men show that a great increase in the volume of the streams may accrue from the denudation of the mountains of their evergreen garments. There is still another condition which tends in this same direction. When the mountain declivities are grassy slopes, the snows of winter drift behind ledges and cliffs and into great banks among the rocks, and they fill ravines and cañons, and are thus stored in compact bodies until they are melted by the summer suns and rains. But when forests stand on the slopes the snows are spread in comparatively thin sheets, and great surfaces of evaporation are presented to the sun and the wind. For all these reasons the forests of the upper regions are not advantageous to the people of the valleys, who depend on the streams for the fertilization of the farms.

But there is an obverse side of this problem. When the waters are stored for irrigation in natural and in artificial lakes the preservation of their reservoirs is of prime importance. Storm

waters wash the sands from naked hills and mountains, and bear them on to the creeks and rivers, by which they are carried to the storage basins. Protection from these injurious agencies is chiefly afforded by vegetation. For this purpose grass and chaparral serve well, but woods are better. For the protection of reservoirs, therefore, it is important that their immediate slopes should be forest-clad, and that all declivities above, the waters of which cannot be discharged in large part of their sediments before reaching the reservoirs, should also have their woods preserved. In the utilization of these timber regions, then, as a source for the lumber which the people need, judgment and circumspection will be necessary properly to select the areas to be denuded. It is thus that the people of the valleys are interested in the forests of the mountains. Among the crags and peaks where winter winds howl, and where the snows fall all winter long, there grow inchoate cottages and schoolhouses and the fuel that illumines the ingleside. And the mountain passes are the portals through which the clouds of heaven come down to bless their gardens and their fields, and to fill the fountains from which their children quaff the water of life.

The lowlands of the arid region are dry and hot, and are almost destitute of grasses. The summits of the highest mountains are in regions of almost perpetual frost, and grasses are practically wanting. Between these extremes of mountain top and desert valley there are vast areas of nutritious grasses, scant below, but becoming more luxuriant as one climbs the hills, traverses the plateaus, and wanders over the mountain sides. The lowest lands, those bearing more scant grasses, are the lands to be irrigated, for the waters can be taken to them. The better pasturage lands are usually too high for agriculture.

Climatic temperature decreases from the level of the sea to the summit of the mountains, but it also grows colder from the equator to the poles. Now the lowest lands of the arid country are farthest south. In Arizona and southern California the uninhabitable deserts of America are found; there are districts of country below the level of the sea and other stretches just above it. These low, torrid lands are strewn with pebbles, over which the winds sweep and carry on their way a load of sand as an instrument by which the pebbles are polished. It is thus that the desert in many places is paved with a mosaic of gems that gleam in many colors and blind the eye with their radiance. There are other stretches where billows of sand drift across the desert with the prevailing winds. Still other areas are covered with sand and stony fragments and strewn rocks,

where vegetation gains little foothold. All these lands are worthless. In passing from the Mexican to the British line, where conditions of altitude are the same, the grasses steadily improve, and those of the northern half are comparatively rich. But even here there are waste places, for lava-fields abound that are virtually desert. And there are "bad lands" that yield little vegetation. These lands are hills of clay and sand that are washed by the storms and baked by the sun. When the rains come the hillsides are sloughs, and when the winds come the dried surfaces crack and crumble. Then there are cañon lands that are carved by many winding, branching gorges, and thus are rendered worthless. Then there are alcove lands where every rill of the rainy season heads in a precipitous, rocky gulch. These are also barren. Then buttes are scattered over the mesas and plateaus—fragments of formations left by the destroying storms for their future employment. Then there are cinder-cones, naked and desolate. Often lines of cliff stretch athwart the country—the margins of mesas and plateaus. These cliffs are worthy of further mention. When the winds drift the clouds along the lowlands, such a cliff, a few hundred or a few thousand feet in height, obstructs their way. So the clouds rise and discharge their moisture, and floods are speedily born. In regions of cliff a large portion of precipitation is along these lines, and yet with this increased precipitation they are not favored with great vegetation, for the water glides away on the steep declivities, and a zone of lowlands near by receives them, and here the most valuable forests of piñon and cedar are often found. Then the mountains are not all grassy slopes, for they are often interrupted with rocks and ledges and cliffs that are naked.

Though the grasses of the pasturage lands of the West are nutritious, they are not abundant, as in the humid valleys of the East. Yet they have an important value. These grasses are easily destroyed by improvident pasturage, and they are then replaced by noxious weeds. To be utilized they must be carefully protected, and grazed only in proper seasons and within prescribed limits. But they cannot be inclosed by fences in small fields. Ten, twenty, fifty acres are necessary for the pasturage of a steer; so the grasses can be utilized only in large bodies, and be fenced only by townships or tens of townships. Yet they must have protection or be ruined, and they should be preserved as one great resource of food for the people. When the valleys below are irrigated, so that flocks and herds may be fed when the snows and frosts of winter come, the hills and mountains of the arid region will support great numbers of horses, cattle, and sheep.

The mountains of the far West are full of gold. Ores of the yellow metal are found in fissures that seam the rock, and fill spaces between barren formations, and lie in bodies where lavas have cooled in hill-bound basins. Then the whole mountain region has been plowed with glaciers and swept by storms or buried by river floods, and in these glacial gravels and storm gravels and river gravels the gold has been carried, and here the placer mines are found. In other hills and mountains there are stores of silver and copper, while lead and iron abound. Then asphalt, oil, and gas are found, and the hills are often filled with coal. With slight exception all of these minerals are found in lands which cannot be redeemed for agriculture. The coal lands are chiefly pasturage lands, and the gold and silver mines are under the forests. The coal and iron have been and can be discovered by science, but gold and silver are discovered by prospectors and revealed only by the pick and shovel. These mines of gold and silver furnish the basis of our monetary system, and are the source of vast wealth. During the last calendar year \$32,816,500 in gold and \$59,118,000 in silver were taken from these regions, and this supply is to be continued through an indefinite future.

When the waters are stored in the mountain lakes, and the canals are constructed to carry them to the lands below, a system of powers will be developed unparalleled in the history of the world. Here, then, factories can be established, and the rivers be made to do the work of fertilization, and the violence of mountain torrents can be transformed into electricity to illumine the villages, towns, and cities of all that land.

Such are the non-agricultural lands of the arid region. They are forest, pasturage, and mineral lands, on which great industries are in process of foundation. More than twenty years ago I entered the region for the purpose of studying its resources. The investigations then begun have been continued to the present time, and in them many of the great scientific men of America have been employed. In that early day gold and silver mining was the chief attraction, and there were inchoate cities and towns in many places. Agriculture and manufacturing were almost wholly neglected. Everywhere men were digging into the heart of the mountains for gold and silver, and armies of men were engaged in prospecting, lured, now here, now there, by rumors of great discoveries. These armies were composed of stalwart men, adventurous, brave, and skillful. Away in the wilderness, without capital, but endowed with brawn and brain, they established industries, organized institutions, and founded a civiliza-

tion which must forever be the admiration of mankind. The physical conditions which exist in that land, and which inexorably control the operations of men, are such that the industries of the West are necessarily unlike those of the

East, and their institutions must be adapted to their industrial wants. It is thus that a new phase of Aryan civilization is being developed in the western half of America. On this subject I hope to be heard at another time.

J. W. Powell.

A WORLD-LITERATURE.

IN Eckermann's "Conversations with Goethe" ("*Gespräche mit Goethe*") that poet is represented as having said, in January, 1827, that the time for separate national literatures had gone by. "National literature," he said, "is now a rather unmeaning phrase (*will jetzt nicht viel sagen*); the epoch of World-Literature is at hand (*die Epoche der Welt-Literatur ist an der Zeit*), and each one must do what he can to hasten its approach." Then he points out that it will not be safe to select any one literature as affording a pattern or model (*musterhaft*); or that, if it is, this model must necessarily be the Greek. All the rest, he thought, must be looked at historically, we appropriating from each the best that can be employed.

If this world-literature be really the ultimate aim, it is something to know that we are at least getting so far as to interchange freely the national models. The current London literature is French in its forms and often in its frivolity; while the French critics have lately discovered Jane Austen, and are trying to find in that staid and exemplary lady the founder of the realistic school and the precursor of Zola. During our Centennial Exposition I asked a Swedish commissioner if Fredrika Bremer's works were still read in Sweden. He said that they were not; and when I asked what had taken their place, he answered, "Bret Harte and Mark Twain." Among contemporary novelists Mr. Howells places the Russian first, then the Spanish, ranking the English, and even the French, far lower. He is also said, in a recent interview, to have attributed his own style largely to the influence of Heine. But Heine himself, in the preface to his "*Deutschland*," names as his own especial models Aristophanes, Cervantes, and Molière — a Greek, a Spaniard, and a Frenchman. Goethe himself thinks we cannot comprehend Calderon without Hafiz,

Nur wer Hafis liebt und kennt
Weiss was Calderon gesungen,

and Fitzgerald takes us all back, certainly with great willingness on the reader's part, to Omar Khayyám. Surely, one might infer, the era of a world-literature must be approaching.

Yet in looking over the schedules of our universities, one finds as little reference to a coming world-literature as if no one had hinted at the dream. There is an immense increase of interest in the study of languages, no doubt; and all this prepares for an interchange of national literatures, not for merging them in one. The interchange is a good preliminary stage, no doubt, but the preparation for a world-literature must surely lie in the study of those methods of thought, those canons of literary art, which lie at the foundation of all literatures. The thought and its expression — these are the two factors which must solve the problem; and it matters not how much we translate or overset — as the Germans felicitously say — so long as we go no deeper and do not grasp at what all literatures have in common. Thus in the immense range of elective studies at Harvard University there are fifteen distinct courses in Greek, fourteen in Latin, and twenty each in English, French, and German; but not a single course among them which pertains to a world-literature, or even recognizes that these various branches have any common trunk. The only sign that looks in the slightest degree in this direction is the offering of two courses in Greek and Latin jointly, — only one of which, however, is given this year, — of three in Germanic Philology collectively, and seven in Romance Philology collectively; almost all of these, however, being wholly philological, not in any sense literary.

No study seems to me to hold less place in our universities, as a rule, than that of literature viewed in any respect as an art; all tends to the treatment of it as a department of philology on the one side or of history on the other; and even where it is studied and training is really given in it, it is almost always a training that begins and ends with English tradition and method. It may call itself "Rhetoric and English Composition," but the one of these subdivisions is as essentially English as

the other. It not only recognizes the English language as the vehicle to be used — which is inevitable — but it does not go behind the English for its methods, standards, or illustrations. There is at Harvard a professorship of Art — but this means plastic art alone; and there is a professorship of Belles-Lettres, but only as an adjunct to the French and Spanish languages and literatures; and moreover this professorship is vacant. That there is such a thing as training in thought and literary expression, quite apart from all national limitations — this may be recognized here and there in the practice of our colleges, but very rarely in their framework and avowed method.

And, strange to say, this deficiency, if it be one, has only been increased by the increased differentiation and specialization of our higher institutions. Whatever the evils of the old classical curriculum, it had at least this merit, that it included definite instruction in the fundamental principles of literature as literature. So long as young men read Quintilian and Aristotle, although they may have missed much that was more important, they retained the conception of a literary discipline that went behind all nationalities; that was neither ancient nor modern, but universal. I heartily believe, for one, in the introduction of the modern elective system; what I regret is that, in this general breaking up and rearranging, the preparation for a world-literature has been so far left out. If Goethe's view is correct — and who stands for the modern world if Goethe does not? — then no one is fitted to give the higher literary training in our colleges who has not had some training in world-literature for himself; who does not know something of Calderon through knowing something of Hafiz.

And observe that Goethe himself is compelled to recognize the fact that in this world-literature, whether we will or no, we must recognize the exceptional position of the Greek product. In this respect "we are not confronted by a theory, but by a condition." The supremacy of the Greek in sculpture is not more un-

equivocal than in literature; and the two arts had this in common, that the very language of that race had the texture of marble. To treat this supremacy as something accidental — like the long theologic sway of the Hebrew and Chaldee — is to look away from a world-literature. It is as if an ambitious sculptor were to decide to improve his studio by throwing his Venus of Milo upon the ash-heap. There is no accident about art; what is great is great, and the best cannot be permanently obscured by the second best.

At the recent sessions of the "Modern Language Association," in Cambridge, Massachusetts, although all the discussions were spirited and pointed, it seemed to me that the maturest and best talk came from those who showed that they had not been trained in the modern languages only. The collective literature of the world is not too wide a study to afford the requisite foundation for an ultimate world-literature; and surely the nations which have brought their product to the highest external perfection need to be studied the most. I will not here dispute the oft-quoted assertion of Mr. C. F. Adams as to the superiority of the German literature over the Greek — a testimony which was a little impaired, it will be remembered, by his statement that he had early forgotten his Greek and never really mastered German. But it seems safe to rest on two propositions which seem irrefutable: first, that all advances towards a world-literature must be based on principles which have formed the foundation of every detached literature; and secondly, that these principles are something apart from the laws of science or invention or business, and not less worthy than these of lifelong study. It was the supremely practical Napoleon Bonaparte who placed literature above science, as containing above all things the essence of human intellect.

J'aime les sciences mathématiques et physiques; chacune d'elles est une belle application partielle de l'esprit humain; mais les lettres, c'est l'esprit humain lui-même; c'est l'éducation de l'âme.

Thomas Wentworth Higginson.

THE SHOSHONE FALLS.

PROCEEDING by the Oregon Short Line northwesterly from Granger, Wyoming, on the Union Pacific, the first object of interest to the traveler is the Fossil Mountain, seven thousand feet above the sea level, where abundant specimens of fish embedded in clay are to be obtained. Thence descending to the valley, with spurs of the wide-spreading Rockies on each side, one is borne along the banks of the beautiful Bear River. Distant from Granger 146 miles is the hamlet of Soda Springs, Idaho, destined to be the great sanitarium of the West. Here we diverge from the Bear River, which takes a sudden turn at the opening of the valley and pursues its course 150 miles in a southerly direction until it pours itself into the Great Salt Lake. The greater part of the distance traversed by the railroad from this point is over a bed of solid lava, that is to say, for 320 miles, until it reaches Caldwell. Beyond this station, which is situated at the mouth of the luxuriant Boisé Valley, a veritable garden for its whole extent of fifty miles, the country is susceptible of irrigation, and will at a future day be able to support a population larger than that of some of the New England States.

As we penetrate the mountain range, on entering the Port Neuf Cañon, we find that the fire king did not attempt to throw the lava above the plain, but left the green and wooded hills unscathed. Skirting the banks of the stream that dances gaily along at their base we come to Pocatello, the junction of the Utah and Northern Railroad. Huge blocks that have been blasted out are thrown up on the sides of the track, and all around there is a dreary expanse of sage-brush growing upon a thin soil formed by the accumulated dust of centuries. Far away in the distance are the snow-clad peaks of the western spurs of the Rocky Mountains, and at intervals of the immense plain extending to their base, blue buttes stand up like islands in the sea. Occasionally we pass a wagon-train of slow-toiling emigrants. This unbroken monotony, with its attractions by no means small, is first interrupted when we reach the American Falls, twenty-five miles from Pocatello, where the Snake River is spanned by a substantial iron bridge. The name of "falls," which is perhaps correctly applied to all falling water, is mis-

leading to those whose understanding of the word is abruptness or suddenness of descent. They turn away their eyes and exclaim, "They are only rapids after all." Crossing the river our course lies in a direction nearly due west, while the tortuous stream so appropriately named the Snake bends for a time to the south, twisting in coils as it crawls through the deep ravine hollowed out for itself in the lava. The scanty bunch grass is yet enough for the support of cattle, who descend through occasional gorges for their water. These migratory herds prefer the richer grasses of the mountains and the streams of the cañons for their summer sustenance, resorting to the bottoms only in the winter season, when the snow is never too deep to prevent them from cropping their food. Thus the ranchmen here enjoy a great advantage over their fellows in the higher altitudes, who are obliged to cut and put up their hay. The river hereabouts would be entirely useless but for its value to the herds on the winter range, as it runs too low to be made available for the purposes of irrigation.

From the American Falls onward to Shoshone, eighty-two miles, the railroad traverses a country of the same characteristics already described. Desolation is everywhere written upon its black surface—rifted chasms and volcanic excrescences only varying its dark monotony.

The town, or, as the settlement is called, the city of Shoshone, is but the hundred-times-repeated duplicate of the new municipalities of this Western region—the only greater merit it can claim being that it is larger than many others. Brigham Young first established the rule, which has become universal in this region, that all the streets of his empire should be exactly eight rods wide. Conformity to another of his laws cannot now be strictly observed, as it is interfered with by the courses of railroads. In Utah every building faces one of the four cardinal points of the compass, the streets all running from north to south or from east to west. The incoming Gentiles have not improved upon the Mormon architecture of log and adobe houses, which, if not beautiful, are at least picturesque. The Gentile idea is that of flimsy shingle structures which can be easily taken to pieces and moved with the frequently removing towns. There is a stage line from Shoshone City to the Shoshone Falls over a nominal distance of twenty-five miles, but which is really thirty,

and seemingly a great deal more. Let it be remarked here in parenthesis that in June the water of the Snake is at its height, whereas at the time of our visit, early in October, it had fallen twelve feet; but this subtraction from the full volume is balanced by more agreeable weather and the torpidity of the rattlesnakes. The same always dreary plain extends to the base of the mountain range south of the river, the only sign of life being the half-way station, where the relay of stage horses is kept and fed on the hay and water carried to them. We knew that the river rolled between us and the hills, but it was so far beneath the surface that it was nowhere visible. Suddenly, just at the dusk of evening, we came to the abrupt precipice, and at the same instant the mighty roar of the cataract greeted our ears.

The water is compressed in many places like that of Niagara below the Suspension

Bridge; and at its narrowest limit, 700 miles farther on in its course, even after it has been joined by the Columbia, a greater stream than itself, it is confined between the unyielding rocks at the Dalles, where it becomes only one-tenth of the width at Shoshone when it takes its fearful leap of 210 feet from the abyss above into the greater abyss below. It was at the rim of the upper chasm that we had now arrived. Here it is that the river, in ages beyond our computation of time, had formed out of the solid rock a basin 800 feet in depth and half a mile in width, and had constituted itself into a lake whose surface must have been level with the plain on which we stood and looked down upon the meadow left by its receding flood when it had escaped through the gateway it had patiently been cutting out for innumerable years. At great expense and patient labor a zigzag road has been made along the perpendicular descent of 800 feet. Alighting

from the wagon and tying the front and hind wheels together, we led our horses down this rather perilous path to that little bit of meadow upon which was pitched a large, commodious tent, serving the purpose of a hotel quite as well as the frame building which has since been erected on the other side of the river.

At length the rays of the morning lighted up the vast encircling panorama of grotesque crags and imaginary castles which had darkly frowned upon us from their exalted heights, and amidst this gorgeous display our steps were led to the brink of the great cascade.

At Niagara the water spreads widely at the

For the first part of the night the roar of the water prevented sleep, but the steadiness of the noise at length lulled us to repose. On awaking in the morning the sound seemed to come from a different direction, and the change was explained by the fact that the wind had shifted during the night, thus bringing the echo from another place. Indeed, without the aid of a guide we should not readily have found our way to the cataract, as the echo, constantly moved about by the eddies of the wind, would have carried us out of our course. Daylight and sunshine on the upper plains were long in advance of their appearance in the basin below.

top, thus distributing its volume, but compressing itself at the end of its fall; whereas here the compression is made before the start. Preceding the grand leap there are no forewarning rapids giving notice of what the river is about to do, but silently it flows on as if it had at last reached its ocean level, and then, with one slight hint in its little side show of the Bridal Veil jutting out around a corner rock, it precipitates itself perpendicularly in one solid mass sixty feet farther downward than its great rival of the East. The whole width of nine hundred and fifty feet, both at top and bottom, is almost precisely that of Niagara on the American

side at the base. To ascertain the difference in the volumes of water, a very nice calculation should be made of the rapidity and depth of the current. To institute a comparison of the general effect, we refreshed our memories a few weeks later by a visit to Niagara. A mere look at Shoshone from the north side, on which we first approached it,—such a look alone as is too often satisfactory to tourists to whom obstacles in the way of seeing it all seem insurmountable,—gives but a faint idea of the magnificent whole. Preparations were in progress for a wire ferry at a distance of half a mile above the cataract, where the river is about four hundred yards wide. The ferriage at the time of our visit was conducted in a little skiff, which, with proper precautions, promises greater safety, as it is more manageable than a larger boat would be if accidentally the wire should be broken.

The timid visitor who satisfies himself with a view from the north side of the river departs with no conception of the infinitely more grand and impressive scene which opened to our view from the other side. One might as well be content with seeing Niagara from the American side, discrediting the story told him of the Horse-shoe Fall as viewed from the Canadian shore. These contrasts have a striking resemblance, for once arrived upon the southern bank of the Snake the whole contour is changed. The bend before unnoticed is made apparent. What seemed all straight is now a curve at the top, tumbling in upon itself at the bottom in a solid mass, striking the rocks with such force that it springs up again a hundred feet in a column of water, foam, and spray. To obtain the various views in which the cataract presents itself, no little toil is requisite. The labor of getting down, with the danger added, is quite as much as that of getting back. From one rock to another, jutting out from the straight wall, the trunks of pine trees have been laid with their branches cut off, so fashioned that they serve as steps, while a wet, slippery, hanging rope is supposed to afford some additional security. From a bit of flat rock where we take a temporary rest upon the way a curious view of the cataract is obtained through an aperture under the "natural bridge." The drawing from a photograph taken on this spot will indicate the space which distinctly represents a bear in an upright position. Descending nearly to the surface of the river below the falls and one thousand feet below the plain above them, we arrive at the curious cave upon which the name of Cathedral Dome has been most appropriately bestowed. It is 175 feet high and 40 feet square, the dome in which it culminates chiseled out by the swirling waters in just proportions and

awful grandeur thousands of years before Christopher Wren or Michael Angelo tried their 'prentice hands at architecture.

At one end of this mysterious sanctuary of nature there gushes out a cool, pure stream called the Baptismal Font, and through its open door comes the hoarse, reverberating music of the cataract playing its undying anthem. Its pulpit is everywhere, for if there be sermons in stones they are preached by these eternal rocks.

Below the Great Shoshone cataract, where the parallel of the river's contraction is nearly exact, the eye rests only upon bare, perpendicular crags a thousand feet high. First descends that four hundred feet of lava coating, and beneath it in their regular order the original surface of soil, the clay, and the granite. In some places where the soil was wanting, so that the devastating fire came in immediate contact with the clay, it burned it into brick, making a readily imagined picture of a city street with its long line of houses suspended in mid-air between the sky and the water.

The Twin Falls were yet to be seen. To reach them was the most difficult undertaking of the day. Climbing up the slippery ladders by which we had descended, and walking to the place where the skiff had been left, we embarked again and pulled up the stream a mile and a half, avoiding the current and whirlpools by keeping in the eddy until some impassable rapids were reached. Then, making fast the boat to a rock, we landed, and pursued our way for nearly two miles, not always on foot, but often swinging across the chasms by our arms or creeping like lizards over the lava boulders. This method of progression occupied more than two hours, when by a sudden turn we were brought face to face with the falls, so near to them that we were covered with their spray. Here above, the river flows on a plane two or three hundred feet higher than at the Great Shoshone, and is divided into two narrow channels separated by a rock. From each channel leaps a waterfall 70 feet in width and 182 in depth. Twins they are in age and size and beauty, tumbling joyously side by side in their wild play, dancing upwards in their spray and then twirling in each other's arms in whirlpools and eddies in their onward course.

It will appear by these notes that at the brink of the Twin Falls the gorge is about 400 feet high, at their base 182 feet higher. Allowing 200 feet for the descent of four miles of rapids, it would be, as before stated, about 800 at the brink of the Great Shoshone, and rather more than 1000 at its foot. These measurements are at least approximately correct.

"THE LITTLE MAN IN THE TINSHOP."

WHEN I was a little boy, long ago,
And spoke of the theater as "the show,"

The first one that I went to see,
Mother's brother it was took me;
(My uncle, of course, though he seemed to be
Only a boy — I loved him so!)
And ah, how pleasant he made it all!
And the things he knew that I should know! —
The stage, the "drop," and the frescoed wall;
The sudden flash of the lights; and oh,
The orchestra, with its melody,
And the lilt and jingle and jubilee

Of "The Little Man in the Tinshop"!

For uncle showed me "The Leader" there,
With his pale, bleak forehead and long, black hair;
Showed me the "Second," and "'Cello," and "Bass,"
And the "B-Flat," pouting and puffing his face
At the little end of the horn he blew
Silvery bubbles of music through;
And he coined me names of them each in turn,
Some comical name that I laughed to learn,
Clean on down to the last and best,
The lively little man, never at rest,
Who hides away at the end of the string,
And tinkers and plays on everything, —

That's "The Little Man in the Tinshop"!

Raking a drum like a rattle of hail,
 Clinking a cymbal or castanet ;
 Chirping a twitter or sending a wail
 Through a piccolo that thrills me yet ;
 Reeling ripples of riotous bells,
 And tipsy tinkles of triangles —
 Wrangled and tangled in skeins of sound
 Till it seemed that my very soul spun round,
 As I leaned, in a breathless joy, toward my
 Radiant uncle, who snapped his eye
 And said, with the courtliest wave of his hand :
 “ Why, that little master of all the band
 Is ‘ The Little Man in the Tinshop ’ ! ”

And I ’ve heard Verdi, the Wonderful,
 And Paganini, and Ole Bull,
 Mozart, Handel, and Mendelssohn,
 And fair Parepa, whose matchless tone
 Carl her master, with magic bow,
 Blent with the angels’, and held her so
 Tranced till the rapturous Infinite —
 And I ’ve heard arias, faint and low,
 From many an operatic light
 Glimmering on my swimming sight
 Dimmer and dimmer, until, at last,
 I still sit, holding my roses fast

For “ The Little Man in the Tinshop ” !

Oho ! my Little Man, joy to you —
 And yours — and theirs — your lifetime through !
 Though I ’ve heard melodies, boy and man,
 Since first “ the show ” of my life began,
 Never yet have I listened to
 Sadder, madder, or gladder glees
 Than your unharmonied harmonies ;
 For yours is the music that appeals
 To all the fervor the boy’s heart feels —
 All his glories, his wildest cheers,
 His bravest hopes, and his brightest tears ;
 And so, with his first bouquet, he kneels

To “ The Little Man in the Tinshop . ”

James Whitcomb Riley.

"THAT YANK FROM NEW YORK."

HE gray of dawn was beginning to brighten with roseate flashes of light as Joseph Bell unhooked the door of his adobe dwelling and stepped out on to the little veranda overlooking the plateau of the Coteria mine, where he sat down wearily on the brick coping. He had passed an anxious, sleepless night, and his features wore an expression of listlessness and disappointment which showed that he was in trouble. For a few minutes he sat quiet with his head in his hands; then, springing nervously to his feet, like a man who had come to a sudden decision, he struck the signal gong nailed against one of the pillars of the porch, lighted a cigar, and, blowing the smoke of the first whiffs far away, said aloud:

"Well, it's got to stop; and, what's more, it is going to stop to-day. I suppose I had better see Garcia about it first," he added meditatively, after a few puffs. "These Mexicans know their country better than do we Gringos, with all our conceit and mistaken contempt for the genus Greaser. Ah! Torribio, *buenos dias*," he went on, as his *mozo*, draped in a blue *serape*, walked up, jingling the little bells on his spurs.

"*Buenos dias*, Don Pepe! You passed a good night?" the boy cried out in answer. "You struck the gong?"

"Yes. We are going to Alamos. Let Félix get ready. I'll take him along too. And tell the captain I wish to see him here at once. Be quick now, and see that Teresa brings the coffee. And, by the way, I'll take my carbine this morning."

When the boy had disappeared, Bell took down his spurs and his revolver from a nail on the wall, and buckled them on leisurely; then he sat down again and waited. The day's work was decided upon, and he could afford to thrust his cares aside; for, now that he was about to grapple with them materially, they seemed much less formidable than during the long hours of the night, when he was endeavoring to make up his mind as to what really was his duty. The morning air was fresh and cool, his cigar was good, and his coffee deliciously aromatic, so why not enjoy the sensuous pleasure of the moment? Life in Sonora offers none but the most material enjoyments, and those not so often as to dull the appetite for comfort; as for disagreeable duties, they

form the major part of the day's routine, and amply sufficient unto each day is that part thereof. The cactus bears a thousand times a thousand thorns that last the year round, and but a handful of mildly flavored fruit that ripens once in May; so let the May-time be a holiday!

While he was half unconsciously trying to convince himself that this very practical, if not very ennobling, philosophy was the best, Bell was aroused from his reverie by the approach of big Jack Corbis, the captain of the mine.

"Good morning, Mr. Bell," he cried out, stopping a few feet away from his boss and dropping the head of a pick which he carried on his shoulder, more as a badge of his office than for the purpose of applying it to any practical use. "You be up kind o' early this mornin', sorr. Hot day, too, it's meanin' to be, sure 'nough!" he added, wiping his forehead with the back of his wrist and looking up at the pink-and-gray ripples of cloud in the sky. Then, as if suddenly recollecting something, he said in an indifferent tone: "Toe-ribyoe let on as how you was wantin' to see me here, Mr. Bell. C'n I help ye any?"

There was in his tone, as usual when he spoke to the superintendent, a suggestion of patronizing kindness or condescension, and Bell naturally resented it; for Jack's whole manner seemed to imply, "I know exactly what is to be done, but it is a part of my duty to come up and ask you, just as if I did n't; so here I am to fulfil this little formality before going to work in my own way; but there's no hurry." And he emphasized this by jerking a tobacco-pouch from his hip-pocket and leisurely filling his pipe.

Bell half smiled, half frowned, as he read the man's thoughts, flattered by the ease with which he did so, yet at the same time displeased at his own implied inferiority. "Not merely implied, though," he was obliged to own to himself as he looked at Jack's stalwart figure and brawny arms. "As an animal he is worth five of me, and I suppose that down here a man should be gauged rather more than less by his physical points. Then, too, he has had twenty years' experience below ground, and I have had less than one; he will intuitively solve nine problems out of ten, while I have to puzzle over and work them out on paper, without even then being sure that I am right. Yet he earns four dollars a day to

"THAT 'S ALL FOR THIS MORNING."

my fifteen, and has to take his orders from me,—‘that Yank from New York,’— who but a few months ago was no more than a *stud. rerum met. et mont.* If I were in his place I should resent it less good-naturedly than Jack does, I am sure. Taking it all in all, I think he behaves remarkably well. To be sure, there’s the tenth problem—” His *amour propre* suggested, and the consciousness of his superiority returned to him at once.

“I don’t know that you can help me, Jack,” he answered quietly, “beyond carrying out what orders I give you. I am going into town this morning, and shall not be back before sunset, so we must postpone surveying the old *socabon* until to-morrow. You can put on two extra gangs in the Salon Grande, and run the rest as usual. At five I want you to blow the whistle and send all the men—mind you, *all* of them—up to the compressor-room. I shall have something to say to you. That’s all for this morning.”

The boys had come up with the mules before Bell concluded, and without waiting for an answer he vaulted into the saddle. As he rode away he was conscious of a feeling of relief at not having to listen to Jack’s reply, and at the same time of a certain sense of shame at his momentary cowardice. “Heigh ho!” he said to himself, “this playing at all

or nothing requires more nerve than I am sure of being able to count upon: and how different this is from the pretty chess play we read of in books! It is no longer a moving of a wooden or an ivory king—or—at least the king now is myself. How shall I come out this evening? *Quien sabe?*” And, as in life some innocent victim must always suffer for the disturbed vibrations of our temper, Bell’s mule was suddenly and rather undeservedly reminded that her rider was a “caballero with silver spurs.”

Meanwhile Jack Corbis stood on the same spot, holding his half-closed hands over the bowl of his yet unlighted pipe, with a half-admiring, half-doubtful expression on his handsome cavalier’s face. “Well—I ’ll be tchee-war-war’d!” he said finally and conclusively as he drew a match across the rear of his overalls. “The young un said that as if he really was a-goin’ to fight the crowd on us—Gringos an’ Cornishmen an’ Greasers an’ Injuns—jest as we stand. Wal! I doan’ know but I like that; come now, hang me if I doan’t. We ’ll make a miner of that boy some day, sure’s taxes. He can’t have all the men, mind ye, though. There’s that job down to the Rochin cross-cut’s got to be fixed to-night. All right, now, Master Bell; we ’ll give you a show, or my name ain’t Jack Corbis, nor

never was!" And, shouldering his pick, the captain of the mine walked away with a heavy tread towards the shaft, grumbling to himself between the puffs of his pipe.

By the time Bell had reached the village at the foot of the Cotera range he had regained his usual composure and self-confidence. Like most intelligent men of a quick, nervous temper, who see the dozen different sides of a question at the same time, he was slow to

property, this had been handed over to him by his predecessor, a middle-aged, uneducated Cornishman, who had conceived an immediate and violent dislike to the refined, well-read young American. In his farewell speech to the men he had found it expedient, after expressing his satisfaction at the efficient way in which they had served him, to regret that "that Yank from New York" should have been sent down to boss them, and to hope that

"I 'M READY TO BEGIN RIGHT NOW." (PAGE 936.)

make up his mind on matters of importance; when, however, that result had been accomplished, he never wavered, but threw his whole energy into the attempt to reach his end. He was still too young to be hampered by the record of partial or doubtful successes, for whatever success he had achieved in life was still too recent to have been diminished by the perspective of time; and without being exactly conceited, he was yet keenly appreciative of his own talents. Moreover, he knew from experience that the day before the ordeal the nerves are more sensitive to its imaginary formidableness than on the day itself, when the struggle has begun. He also felt that he was fighting for no more than his right, and had not read a sufficient number of Russian novels to know that if might is right, right is not always might. So that on the whole he felt tolerably confident of success.

When, two months before, he had come down to Mexico to take charge of the Cotera

under such a questionable leadership they might not become demoralized. Bell, as it happened, did not come from New York; but he had been sent down from there by the office, and in Mr. Harris's ingenuous mind all Yankees hailed from either New York or San Francisco, according as they belonged East or West. Moreover, the lurking contempt of the great West for the daily increasing "effeteness" of the Atlantic slope was satisfied in the summary description of the young man's "size," as was also the Cornishman's dislike of the American. In such remote communities as this mining-camp, where the principles of right and wrong are variable and determined by the caprice of the moment, the jingle of a word often outweighs its sense. So in this case, without stopping to reflect, the men, pleased by the phrase "that Yank from New York," adopted it as a characteristic definition of their leader. Half unconsciously, to be sure, but none the less absolutely, the Yankees and then

the Cornishmen began to talk deprecatingly of the new boss; before long the Mexican employees discovered their superiority; and as nothing is more contagious than demoralization, the very Indian miners, for the first time in the recollection of their existence, realized that their views should be represented and receive due consideration. Naturally enough these different parties interfered with one another, and disorder ensued. Bell was sufficiently well aware of the fact that things were going wrong; but being a young and inexperienced man in a new country, the language of which he spoke as yet but indifferently, he had only recently understood the real cause of the trouble. "Gangrene—amputation," he said to himself. "That is clear enough; but where shall we amputate, and how?" These questions had kept him awake all night, and as he rode under the great spreading poplars along the bed of the *arroyo* he wondered whether the operation would prove successful. The dismissal of the Mexican officers, which he had resolved to accomplish that very day, was the most difficult problem to solve without exciting such personal animosities as might lead to bloodshed, and it was chiefly on this point that he was going to ask Garcia's advice.

When Bell entered the office Don José-Maria rose from his desk and greeted him warmly; then he led him across the orange-planted courtyard into his private room. "Deign to enter this, your own house, Señor Bell, and allow me to ask permission to absent myself a few moments—yes? Meanwhile you will throw off the heat of the sun. I send some refreshment at once."

Within a few minutes he returned, drew up his chair, and, crossing his hands over his waistcoat, said in his low, caressing voice, "Well, Don José, what can I do to serve you to-day?"

Bell told him the story in detail, wondering the while whether this polite little man, with features of feminine delicacy and beauty and soft, dark eyes, could really be the same Garcia whose bravery and ferocity had become legendary in the district. It seemed impossible, and yet at times, notwithstanding the pleasant expression of his smile, a hard, brilliant glitter, like that of a snake's, would for a moment come into his eyes. He listened attentively without moving or interrupting the speaker until Bell asked him what he should do under the circumstances.

"You must do what is right," he answered, with a slight shrug of the shoulders and gently tapping his thumbs together.

"Yes, Don José-Maria; but what *is* right?"

Garcia shrugged his shoulders again more energetically as he replied: "Every man has his own appreciation of what is right, and in

your position your honest decision will be the best. You have made up your mind as to what you have to do; now do it. That is the best advice I can give you. I would suggest, however, that in the case of the Mexicans you allow them to resign instead of dismissing them; and, whatever the provocation may be, *don't shoot*. Some relative or other is sure to spot you in time. I could have him caught and sent—for the matter of that, along with his whole family—up to the *campo santo*. But what satisfaction would you derive from that if you were also in the graveyard? Believe me, Don José, don't shoot. It is sometimes worth while to control one's most legitimate desires. Now come in to dinner and stay here for the siesta before riding back to the mine. The sun must be hot on the road to-day, is it not?"

They went out, and as they walked slowly across the cool *patio* towards the dining-room, Don José-Maria asked in a casual way, "You live in New York when you are at home?"

Bell laughed aloud, and tore a sheet out of his note-book. "In case anything should happen to me," he answered, writing down the direction, "you can telegraph to this address. But I don't think it will be necessary."

"Quien sabe?" the other replied seriously and pitching his voice in a high key. "Things develop more rapidly here than in the north. But, Don José, allow me to say a word to my brother, who is standing under the portico, and I am with you in ten minutes." When Bell was out of ear-shot Garcia beckoned to his brother, the doctor, and after a short "good day" he said to him: "Do not go out to-night, Alfonso, and keep a couple of mules saddled after seven. You may be wanted at the Coteria; but say nothing about it, please." Then he followed his guest into the dining-room.

It was nearly four o'clock when, having shaken hands for the last time with Don José-Maria, Bell turned his face homeward. The great heat of the day was past, and a gentle breeze blew through the silvery shivering foliage of the poplars and lifted the feathery branches of the *sabinas* that undulated lazily, like delicate seaweed floating back and forth at each wave-lap. The sun was low, and long blue shadows lay across the red soil of the road. In the distance the mountain tops stood out in strong blue-and-purple dashes against the fainter, whitish blue of the sky, while the nearer rugged peaks of barren rock, striped with red iron lines, shone boldly above the slight mist that was beginning to form at their base. The wide plain, studded with round, full-topped trees, and surrounded by the fantastically shaped hills, made a picture of rare coloring and beauty; yet like all tropical scenery, either because of its lack of animal life or

of association with men, it produced a sad impression on the mind, that could never forget its isolation and unimportance in this vast, silent desert.

On this afternoon the impression of intense sadness which Bell could not control may to a certain extent have been due to other causes; for as he rode along towards what the irony of circumstance temporarily obliged him to call "home," he distinctly recalled his feelings on the day when, but a few weeks before, he had traveled this same road on his arrival, buoyed up by the interest of a first visit and by visions of unprecedented success for the mine during his administration. And these expectations had come to what? Whether attributed to his fault or his misfortune, the result remained the same: he had no similar previous experience on which to fall back, and his self-conceit was not so sturdy as to absolve him in his own judgment of any unintentional errors. "Que diable allai-je donc faire dans cette galère?" he said aloud and with a bitter laugh. "Well," for better for worse I took Dame Coteria; let us see what manner of welcome the shrew bids me to-night — the very night of her taming too, or I am much mistaken." And so saying he whipped his mule with the reins and galloped up to his office at the mine just as the whistle blew for the men to assemble.

For perhaps half an hour Bell paced his brick floor composing, or rather attempting to compose, his speech; but he had barely begun to make some progress when his boy Torribio, dispensing with the formality of a knock at the door, walked into the room to say that the men were waiting. "I suppose Félix and I had better each take a lantern, Don Pepe. No? It is half dark already in there; and — I told Félix to bring his carbine; that will make three with yours and mine."

Bell merely nodded assent, and told the boy to go on ahead. At the last moment, moved by some sudden impulse, he threw down his gun and unbuckled his revolver. "They would be of no use to me any way," he reasoned as he walked towards the compressor-house, "and I shall be all the stronger for being unarmed. At any rate it is the best way of following José-Maria's advice."

As he entered the large room and motioned to the engineer to shut off steam there was a sudden silence, which seemed the more profound for the noisy talking that had preceded it; and the men, who had formed themselves in different groups, all turned curiously towards him. Bell was perfectly calm, but, as he himself felt it, unnaturally so; it seemed to him now that there was little or nothing to say, and for a moment the uncomfortable suspicion flashed through his mind that the wrongs of

which he was about to complain began and ended in his own imagination. To gain time he looked around, as if to see that all hands were present. Guarding the closed door behind him stood his two *mozos*, leaning on their carbines, and in front of each was a large reflector lantern throwing a strong light on Bell, who, in his duck clothes, stood out as the most prominent figure in the room. On his right the white miners were drawn up in line, and on the left the mill hands, a quiet-looking set of men. Opposite, and just in front of the bob of the big pump that swung back and forth like a ponderous pendulum, the Mexican employees formed a little group by themselves, their sallow complexions and dark hair contrasting strongly with the ruddy-faced, light-bearded Gringos. In the second rank behind, the native miners and Indians were packed closely, their bronze-brown skins scarcely lightening the shadow that enveloped them, and their half-closed, glittering eyes, that were all fixed on the boss, gleaming like fireflies on a dark night. Through the window opposite to him Bell could barely see the light of the lantern on the gallows over the shaft burning quietly, and he tried to fancy that it was like a star close at hand.

As he was about to make an effort to say something — what, he did not then know — one of the small boys who were crowded together outside the window lost his hold and tumbled into the room with a loud cry of dismay that was answered by a yell from the assembly. This little incident seemed to break the ice: Bell understood it, and every man there felt it; a cloud of good humor seemed to have burst over their heads, and a smile lurked in the corners of their mouths and eyes. "Now is my time," he said to himself, and stepped forward, trembling a little, but on the whole self-possessed and calm.

"Boys," he began in rather a loud voice, that elsewhere he would scarcely have recognized as his own, "I have n't got much to say to you, but I wish you to understand every word that I do say. For the last two months — in fact ever since Mr. Harris left us — you seem to have got hold of the idea that there was no boss in this camp. Well, perhaps there was n't; perhaps you thought that a 'Yank from New York' was too green to stand over you, and maybe you were right. Now, boys, I don't think you gave me a fair show. Why did n't you come to me like men, and say straight out what you had to say, instead of working behind my back to make trouble? Fifty to one, too! When I knew that I was right I told you what you were to do; and when I was in doubt I asked your advice before deciding what was best. You know that is the truth I am telling

you. Well, boys, you've got a boss now — got him to-night — and I am the man. If there's any one here who does n't like it he can walk straight out of that door, right now, and come for his time to-morrow."

Bell paused a moment, and stepped aside waiting for an answer; but beyond a volley of oaths, mainly meant to be commendatory, none was forthcoming. He had only an indistinct recollection of the words he had used, but he was distinctly conscious of having won the fight. The worst was over: he had asserted himself, and they had understood that he was right; now he could proceed with his duties feeling that the better element in the camp was at his back.

When he came forward again his words had already been translated to the natives, and all bent over eagerly to hear what he was going to say next.

"I am sorry," he began in a lower voice, and hesitatingly — "I am sorry that my first duty should be such a disagreeable one; but I don't see any way of avoiding it. I have noticed that there is a good deal — in fact too much — ill-feeling between Mexicans and white men here at the Cotera. As yet I cannot say who is wrong or who is right. So to-night I mean to have both sides state their grievances openly, and the facts shall decide. Señor Ponce de Leon, will you do me the favor to step forward?"

A giant cartridge exploding in the center of the Mexican group could not have produced a greater commotion than did these few words. For a moment all talked at once, gesticulating wildly and in the greatest confusion, while the foreigners looked at one another and winked, much amused at this sudden turn of affairs. Finally, after a short debate, the oldest of the Mexicans advanced towards Bell and cried angrily:

"Don José! you do not know the customs of this our country. We are caballeros, Señor, and not to be called to account. We cannot submit to be ranked with laborers and treated as such; and I have the honor, in the name of my colleagues here, and also, Señor, in my own, of offering you our resignation."

He bowed low, with an outward, horizontal sweep of his arm, and was just stepping back to join his comrades, when, clear and distinct, the cry of "Fire!" rang out in the still night air, and one of the native miners ran in breathless.

"Don José," he gasped, "the roof where they were retimbering in the Rochin cross-cut has come down, and the timbermen, Don Juan and Don Eduardo, got caught under the rock that fell. I had gone back a moment before, and so escaped most of the dirt; but even be-

fore I cleared myself the wood was on fire, and the big supply pile is just on this side of the cross-cut. Mary, most holy, save the mine!"

"Jack Corbis!"

"Yes — sir!"

"Are there any air-pipes in that cross-cut? Yes? Then drive the compressor till she bursts. Pick out three men for the first gang with you and myself — axes and picks — and four for the next. That will do. Now come — hurry!"

A minute later they stood on the platform of the open cage, silent but resolute. From below the smoke was beginning to rise, thick and black. In the shaft itself it rolled up slowly, boiled up in round cushioned clouds, writhing, advancing, and apparently receding again until it reached the collar and shot upward swiftly, climbing the tall gallows and spreading evenly and slowly into a thick, undulating canopy of a pasty consistency that lay like a circular blot against the sky. Bell looked up overhead for the lantern — his star — and it seemed to him that it was burning, dimly but steadily. Once more he turned to Corbis and asked:

"Candles?"

"Yes, sir!"

"Matches?"

"Yes, sir. All ready, sir!"

"Lower away!"

The gong sounded sharply — ding, ding, ding; "*Bueno!*" came back from the engine-house, and they were gone.

At the third level the cage stopped, and they got out to light their candles. The main body of the smoke was creeping along the roof of the drift, but for a foot above the car-track the air was tolerably clear; so they lay down on their sides, holding their candles in one hand before them, and crawled along in the ooze of the floor towards the fire. Their progress was necessarily slow, and for a few minutes nothing was heard but the grunting and panting of the men and the more distant crackling of the burning wood. Then they reached the cross-cut, and a shower of sparks fell over them. The heat became intense, and at last they were obliged to halt. It looked here as if their task were a hopeless one, yet not one of them thought of going back.

"There ought to be a little water in the unfinished winze close by here, sir," Corbis called out, coughing in the smoke. "If we c'n only reach it I think we c'n push through. Leastways we c'n try. 'T ain't more'n five or six fathom, to your right, Mr. Bell."

"Come along, then, boys!" Bell cried out cheerily; and the strange little procession of five crept on slowly, with lowered heads. To them no doubt those thirty feet seemed longer than many a weary mile under the hot sun

above ground; and probably nothing but the feeling of companionship enabled them to reach together the little hole, which not one of them could have reached alone. Silently they let themselves down into the dirty, greasy water, above which the air was fairly free from smoke.

As Bell glanced at the black-streaked faces of his four companions emerging from the metallic-looking surface of the water he could not help smiling at their ridiculous appearance. "Well," he thought, as he turned from the brightly illuminated drift, where a few yards away a couple of men were probably dying in agony, to the dark hole in which he and his four miners were closely wedged, "I suppose that all through life there is a smile to every tear." Then turning to Corbis: "Jack," he said, "send one of the men back to the station, and let the next gang hurry along. They want to cut a few sets in the drift and plaster the ones nearest the fire with mud. I am going to make a dash ahead, and—if I don't answer your call when you have counted a hundred, you 'll have to come in after me. Here goes!"

He clambered out of the hole, and raising one arm to protect his face, he plunged into the flames; but he had taken only a few steps when his foot struck something soft on the ground, and he fell forward over the prostrate body of a man. He was partly stunned by the blow, but this rather helped him, for the bite of the fire seemed less sharp, and a moment later he staggered out under his burden. It was Ned Bowles, but whether alive or dead they could not tell; he was bleeding from several wounds, and badly burned. "Take him up carefully, boys," Bell cried, "but hurry. Never mind the smoke this time; get him out sharp, and send some more men to take your place. Now, Jack," he went on, as the others vanished in the smoke, "it's your turn. Yell to me if you want help, and good luck to you, Jack, old man. I 'll have to cool off a spell in the water here."

He slid down again into the hole and rested his head on his hands. For a little while he seemed to have lost his power of thought, and even for a moment forgot where he was. In the cool water he experienced a delicious sensation of relief that made him shiver all over, not unpleasantly; then an intense drowsiness came over him. He was on the verge of losing consciousness when, with a loud bellow of pain, Jack rushed out of the fire and slipped into the water beside him.

"John Vinton's in there and alive, Mr. Bell," he shrieked, as soon as he had sufficiently recovered his breath; "but he be under a pile of dirt, and I can't get him out alone. My God, sorr, but it be hot in there! and there

be but little air left. We must hurry. D' ye think ye 'll be able to go back with me, sorr?"

"I 'm all right again, Jack. Come on!"

And for the second time they disappeared in the flames. But how they worked and struggled and writhed in that furnace; how they tore away the rocks and dirt from over the body of their comrade; and how, between them, they bore him away through that hell of burning timber, they never knew. As they emerged from the cross-cut, slowly and heavily, in a halo of fire, with bent heads and in an agony of pain, they perceived vaguely that the drift was full of anxious men.

"Saved?"

"Saved!"

"Hurrah, hurrah, hurrah!" And there rang through the stone galleries of the old mine a great burst of joyful sound that vibrated back from the rock faces, rolling away into the lost corners of the abandoned workings and up through the shaft to the surface, where another excited crowd took it up with their shrill, far-sounding Indian voices, and sent the news across the neighboring *cañadas* into the silent mountains beyond. But suddenly it died out as quickly as it had come.

The nervous strain had proved too much for Bell, and now that it was all over his strength abandoned him; he staggered and fell forward, striking his forehead against a sharp stone, and lay there in the drift, quiet and unconscious. They took him up tenderly, and in silence bore their young captain away to his dwelling on the hillside, where two of the miners sat by his *tarima* to watch until the doctor came. Rough nurses they were, no doubt, but devoted ones; and when at last the doctor told them, "He 'll be all right again soon, Señores," there was great rejoicing at the Cotería mine.

One evening, some days later, Jack Corbis entered the long room of the boarding-house, where the men were sitting along the benches, smoking and talking quietly. Jack put on his spectacles with an unusually dignified air, as he stepped up to the head of the table and threw down a book on which he laid his giant hand. He looked around over the rim of his glasses, and seeing that all were listening, he said in a subdued but more impressive tone than usual:

"If there be any man in this camp so tar-nation mean's t' speak of the boss again as 'that Yank from New York,' so help me God, I 'll skin him first and heave him down the old shaft for the rats to git their work in on! Now that's clear, ain't it? and I 'm ready to begin right now." He waited a little while, but as no one seemed disposed to put his flaying powers to a practical test, he continued, more good-humoredly:

"There be one thing I kind o' wanted to bring to your notice to-night, boys. En that's edyecation. I never took no stock in books ontill quite recently, the other night—the night o' the fire, I mean; 'n it 's beginnin' to look to me as though I'd missed the vein—drifted clean through the foot-wall and into country rock; as though I'd been puttin' in my holes like a man,—good holes, and in the right spot,—but thar won't any ore come down with the dirt. En it's got to be in these times minin' ain't what it used to be oncet, no more 'n anythin' else is what it was. A man without edyecation to-day don't stand no show against a man that has. It's like hand drillin' against a three en a half Rand. Mebbe you knowed all that, en mebbe p'r'aps again you did n't. But that ain't neither here nor there. What there 's to it is this. It was edyecation made the boss a boss—as good a boss as

I want to work for. Now t'other night he jest went right ahead, en we followed him; 'cause he was the best on us, and 'cause we could n't help ourselves followin' him. In course 't were his edyecation did it. We was good men, every man of us; but he was a good man with a lot of edyecation to him besides, en he come out ahead. That's why. Boys, let's edyecate! When Mr. Bell comes round he'll give us a hand en show us whar' we c'n put in the holes best. But meantime I thought I'd jest make a start, kind o' easy; big print en figgers in a handy size for a man o' my heft—that's what I want to begin with. This book here, that I borrowed in the office jest now, with a mate to it for the night shift, seems 'bout right. Let me spell the name to 't:

"Gregory's 'Anal-y-tical Mechanics, Vol. I.'; en that's the corner monument of my new strike."

John Heard, Jr.

THE IDEAL.

BY the promise of noon's blue splendor in the dawn's first silvery gleam,
By the song of the sea that compelleth the path of the rock-cleaving stream,
I summon thee, recreant dreamer, to rise and follow thy dream.

At the inmost core of thy being I am a burning fire
From thine own altar-flame kindled, in the hour when souls aspire;
For know that men's prayers shall be answered, and guard thy spirit's desire.

That which thou wouldst be thou must be, that which thou shalt be thou art;
As the oak, astir in the acorn, the dull earth rendeth apart,
Lo, thou, the seed of thy longing, that breaketh and waketh the heart!

Mine is the cry of the night wind, startling thy traitorous sleep;
Moaning I echo thy music, and e'en while thou boastest to reap
Alien harvests, my anger resounds from the vehement deep.

I am the solitude folding thy soul in a sudden embrace;
Faint waxes the voice of thy fellow, wan the light on his face;
Life is as cloud-drift about thee alone in shelterless space.

I am the drawn sword barring the lanes thy mutinous feet
Vainly covet for greenness. Loitering pace or fleet,
Thine is the crag-path chosen. On the crest shall rest be sweet.

I am thy strong consoler, when the desolate human pain
Darkens upon thee, the azure out-blotted by rush of the rain.
All thou dost cherish may perish; still shall thy quest remain.

Call me thy foe in thy passion; claim me in peace for thy friend;
Yet bethink thee by lowland or upland, wherever thou willest to wend,
I am thine Angel of Judgment; mine eyes thou must meet in the end.

A PROGRAMME FOR LABOR REFORM.

REPORT TO THE SOCIOLOGICAL GROUP BY A COMMITTEE CONSISTING OF
SETH LOW AND RICHARD T. ELY.

I.

STATEMENT OF THE LABOR PROBLEM.

THE labor problem is not an isolated problem. The labor problem embraces a group of social phenomena which has the most vital connection with all other great groups of social phenomena. The labor problem belongs to the life of man as a member of industrial society and comprises one class of industrial problems. By industrial problems we mean those problems which find their origin in the efforts of men to gain a livelihood in organized society, and to do this in an orderly and peaceable manner, to secure justice, and to do right in these efforts, and to make all their efforts minister to the highest welfare of all men. The labor problem is but a part, although a very large part, of the industrial problems of the present day. But even our industrial life in its fullest sense does not exist apart by itself. All modern sociological researches show unmistakably that the life of man as a member of society is truly one, whether this life manifests itself in language, in art, in literature, in religion, in the friendly intercourse and exchange of ideas among men, in the family, in education, or in the municipality, state, or nation.

The branch of knowledge which deals with this entire immense territory is called sociology; but anything like a complete sociology, or even a sociology complete enough for actual use, does not exist now, even if it may exist at some future time. The weakness of the human mind compels us to separate by more or less arbitrary process the entire social life of man into parts and to pursue them separately. The discipline which deals with industrial society is called political economy, but we shall fall into serious error if we fail to remember that it is

closely connected with every other social science.¹

Industrial life, though dealing primarily with material things, is an integral part of the social organization; it conditions all other departments of social life and is conditioned by them. The reciprocity of action—both beneficent and maleficent—between mind and body, by which health or disease in one produces the same in the other, is perfectly paralleled by the relation between the spiritual and scientific elements of civilization and the industrial element.

The labor problem is not a single problem, but a whole group of interrelated problems to which, in popular language, the singular noun rightly attributes unity. The labor problem is a part of the great social question of our day, and it concerns us all vitally.

We reach first of all this conclusion: *The labor problem is only a fractional part of the entire problem of industrial society, and the entire problem of industrial society is only one part of the whole social problem, which includes art, religion, literature, and the various other departments of social life.* While, then, its scope is exaggerated by extreme labor reformers, its ramifications are such that it touches all men, and whoever fails to recognize this errs in an opposite direction.

Recent industrial movements show that industrial questions now under discussion affect the merchant, the manufacturer, the farmer, and the professional classes, and in some cases perhaps even more keenly than the class of wage-workers. It is conceivable that a vast network of monopolies, crushing out all independent producers, might give to artisans, mechanics, and unskilled laborers as steady work as they now receive, or even steadier; as high wages as they now receive, or even higher; and might in the exercise of a beneficent paternalism cause strikes to cease. It by no means follows that this consummation would be a desirable one. We are not prepared to say that a society composed of a few plutocrats

¹ Ingram's "History of Political Economy" (Macmillan & Co., New York, 1888) brings this out clearly in the treatment of the development of economic science.

and a vast mass of even contented day-laborers is in a truly prosperous condition. We would prefer rather a society composed of many grades, with easy transition from any one grade to the next higher, or even the next lower. We arrive then at the second general conclusion: *The labor problem is by no means merely a class problem, and we deprecate as most unfortunate any attempt to treat it as such.*

On the other hand, all social questions touch the labor problem, because the advance of civilization is a matter of vital concern to wage-earners, who cannot prosper as members of a diseased organism. The real advance of labor can come only as part of true social progress; but true social progress is, in our day at least, impossible unless even the humblest classes participate to an increasing extent in the benefits of civilization. The most we could grant is this: as the most numerous class, and as the weaker industrial class upon whom burdens are too easily shifted, perhaps the laboring class is on the whole more deeply concerned in the various problems of industrial society than any other element of this society.

It is, then, well to form the habit of looking at society and its movements from the standpoint of the laborers, because their interests are identical with the interests of the whole of society. *Whenever we truly advance the interests of wage-earners we necessarily advance the interests of all society.* We might call this our third general conclusion. This cannot be said without reserve for any other social class, for we see cliques and parties growing rich by the promotion of special interests in legislative halls and elsewhere, while society as a whole may languish. The laboring class is in reality the only class which is not merely a class, and this justifies the use of the now current expression, "The masses against the classes." No one will, it may be hoped, take this as a justification of all measures which are urged upon or in the name of the laboring classes, or suppose that any sanction is hereby given to that claim of industrial preëminence sometimes advanced in their behalf.

It was once supposed that factory legislation forbidding child labor, restricting the labor of women and young persons, abolishing truck or "pluck me" stores, providing for general education of artisans, securing the safety of men and women employed in naturally dangerous occupations, was class legislation, but experience and science now have demonstrated that such is not the case. While English experience is not different from that of other countries, it speaks out more clearly because experimentation has there been carried farther than elsewhere. The seventh Earl of Shaftesbury—who

perhaps did more for England than any other man who has lived in the present century—was opposed by Cobden, Bright, and the entire school of doctrinaire political economists in his philanthropic efforts to secure what has become the present admirable code of factory laws in England, but he lived to see men like Sir James Graham and Gladstone publicly recant, while Cobden wavered. The nation, with the exception of a few extremists, now approves this legislation, and the political economist Newmarch but voiced the sentiment of scholars when, before the British Association, he declared that the Earl of Shaftesbury had by his efforts established the industrial supremacy of England on a securer basis than ever.¹ Scientific men like Huxley, however, come forward and from a biological and physiological standpoint claim that still greater efforts must be made to promote the intellectual, moral, and physical welfare of the masses, or the future of England will be sacrificed to an illusory and temporary prosperity. The argument is entirely in the interest of England as a whole, because it is seen that the foundation of permanent national well-being must in the future even more than in the past be found in the vigor of body and mind of the great masses.

II.

CAUSES OF THE EXISTENCE OF THE MODERN LABOR PROBLEM.

WE must first notice that social problems may be a sign of health or of disease; they may be growing pains of youthful condition or the symptoms of decrepitude or age. The masses are naturally conservative. A rude and uncultured mind is averse to change, but clings to tradition. The habits of forefathers are followed in speech, in garb, in manners, in industry. Servants in our kitchens resist undoubted improvements, but cling to more arduous methods from conservatism like that of an animal. It is only when man has attained a certain stage of development that he rises above a brutish conservatism and seeks—at first often in crude and mistaken manner—for changed and improved conditions. A youthful people, or an age of the world which exhibits the characteristics of rapidly developing youth, will show this restlessness under wrongs and sufferings, although a mitigation of these wrongs and sufferings has recently taken place, although this mitigation itself may have started the upward movement which looks like youthful growth. On the other hand, a decaying people, or an age of the world which is passing away, exhibits evidences of distress which are totally

¹ See Hodder's "Life and Work of Seventh Earl of Shaftesbury," especially Vol. II.

different in character, however great to the superficial observer may be the resemblance.

The distress of Rome under the later emperors was the agony of expiring life. We hold that we are now suffering from "growing pains." So far we have reason for hope and gratitude. If we but know "the day of our visitation," if we but diligently improve the unprecedented opportunities which the Almighty has given us in these last years of the nineteenth century, we shall find that we are but entering on the dawn of a more glorious civilization than the world has yet seen. This is our faith, and in it we find inspiration.

A deterioration in the condition of the masses may be either absolute or relative. It may be positively worse than it has been in preceding periods, or it may have failed to keep pace with the general progress in wealth and civilization and with the growth of wants.

On the whole, there is reason to believe that, absolutely speaking, the condition of the masses in all civilized lands has improved and not deteriorated in the past generation of the world's history. Yet in some respects we are obliged to acknowledge even an absolute deterioration in large portions of civilized society.

The old security of existence, which is a most important element in well-being, has largely passed away for artisans and mechanics. When industries were conducted on a small scale, the blacksmith at the country cross-roads and the village carpenter might never secure a fortune, but it was their own fault if they did not gain a modest competence. Work might be slack at times, but there was always something to be done. The skilled artisan owned his tools and called no man master. We can remember when in North and South he occupied an esteemed position in the American village. In the South, at least, though not presuming to social equality with the local magnate, he yet held up his head in his presence, and was at times invited to partake of his hospitality. Truly the golden age lies before us and not back of us, yet it were folly to deny that in leaving the past we have lost some good things.

Existence now for the masses is insecure, because bread-winners, to a great extent, no longer owning the tools with which they work, are congregated in huge productive establishments and are manufacturing on an immense scale for an uncertain and even capricious world-market. To-day in the receipt of large wages, they may to-morrow, without a moment's warning, be thrown on the streets without a penny.

This irregularity of employment and of income is most demoralizing. A man has a high industrial development who under such circumstances will carefully estimate average

wages, and will in days of plenty save enough for days of dearth. The educated professional classes are unable to do this; much less, then, the laboring class. Moreover, enforced idleness in our modern cities, almost devoid of opportunities for innocent and wholesome recreation, is apt to lead to intemperance and vice, both wasting the scanty savings of labor.

The environment of the masses has, with the growth of cities and the concentration of industry, got to an ever-increasing extent beyond the control of the masses, and there is reason to fear that it has become morally worse; certainly so for women and children, exposed to the debasing influence of the bad men found in every considerable human aggregate.

The locations of industries are changing more rapidly than ever before, and this necessitates a roving laboring population. A population continually changing domicile fails to take deep root anywhere and loses the moral strength which comes from secure local connections. Taking human nature as we find it, we can scarcely expect that a roving population will fail to become a morally depraved population.

Machinery has been both a blessing and a curse. It has in too many instances killed love for work, which is impossible where a man performs a mere routine operation, belonging to a whole which he does not understand, which he never sees. Mere soulless routine¹ deadens all higher faculties. The mind and muscles acquire speedily certain aptitudes, but become inflexible at an early age. "What," asks Professor Roscher, "must be the aspect of the soul of a workman who for forty years has done nothing but watch for the moment when silver has reached the degree of fusion which precedes vaporization?"

Perpetual changes in industrial processes render a former skill useless, and reduce artisans and mechanics to the overcrowded ranks of unskilled day-laborers, mere wretched drudges.

When we compare the actual amount of wages received by the laboring classes now with their former wages, we find ourselves obliged to abandon that superficial optimism based on an imperfect analysis of industrial conditions. There seems to be an absolute improvement, but can we certainly say that this has been relative? When we find men belonging to the same school of political economy, in arguments on commercial policy, arriving at the conclusion that the labor cost of manufactured articles is but eighteen or twenty per cent. of the entire cost, and then, by similar processes in arguments on labor and capital, endeavoring to convince us that labor receives over ninety per cent. of the product,

¹ Called by Schleiermacher "immoral."

we are justified in exercising a wholesome skepticism in regard to the value of all these statistics. The truth is that, as a whole, they are not worth the paper on which they are written. Scientifically speaking, they are not even worthy of refutation. A few establishments, belonging to a class in which competition is severe, are selected, and from the data given by their experience the most far-reaching conclusions are deduced. Meanwhile, instances tending in the other direction, such as railways and almost all monopolies, are passed over, and rent is not considered at all or is inadequately treated. The correct statement is that of Prof. Richmond M. Smith of Columbia College, in his excellent monograph, "Statistics and Economics," that we do not know the proportions in which products are distributed among the various industrial classes, and until the science of statistics makes further advance we cannot know.

Several things should be borne in mind while granting a probable increase of wages in general. We must consider not the wages of a day, but the earnings for a year, making deductions for all the idle days. Furthermore, increased expenses in many directions should be noticed. We all understand this when we discuss the desirability of higher salaries for judges or college professors, but in talking about wage-receivers we too often lose our common sense. The migrations of which mention has been made, rendered necessary by modern production, are one cause of increased expenses. Every one who has had experience knows how serious a matter it is to move, even from one part of a city to another part. "Three removes equal a fire," said Benjamin Franklin. Great cities which have grown up in this country render life more expensive than it was in rural communities. In Baltimore, street-car fares cost for a family living on the outskirts of the city one hundred dollars a year, at a very moderate estimate. Unsanitary conditions and sickness are another cause of increased expenses.

A college professor, with a family living in a great city, will, it is safe to say, find it difficult to keep down street-car fares, medicines and medical attendance, and incidental expenses to the limit of the entire income of a day-laborer's family.

Increasing civilization means increasing wants of the most legitimate kind, and expenditure for food is now but a minor matter; even food, clothing, and fuel can hardly represent half of the expenses of a family living modestly but worthily in a modern city. Increasing wants are a condition of advancing civilization. Missionaries among barbarous tribes find it necessary to arouse wants, even if but for a hat and a needless parasol, in order

to start civilization. While we may lament the kind of wants too often experienced by the masses, we ought to rejoice in the fact that wants do increase, and strive to give right direction to expanding nature. Increasing wants signify that a formerly sufficient income has become insufficient. Formerly the rational expenditures of an ordinary laborer included nothing for books and magazines, but this is no longer the case.

Another class of causes of the existence of the modern labor problem is to be found in the newness of our present industrial life. We look upon what we see about us as a mere matter of course, but the truth is, its most marked features are scarcely a generation old, and we have not learned to adjust ourselves to them. Let us turn our mind back a hundred years. There was then not a single railway company, not a single gas or telephone or telegraph company, not a single steamboat company, still less any electric lighting company. No cause is more fruitful of social troubles than the corporation, but one hundred years ago we find Adam Smith gravely arguing that there was no future for the corporate form of industry, in his day weak and struggling; because, acting through agents, it could never compete with individual effort! What would we do without banks? It is evident that a business world which could for a day exist without them must have been something very different from anything we know. Less than one hundred years ago there were but three banks in the United States, now there are over three thousand national banks alone.

Free competition is something new; industry on a great scale is comparatively new; large aggregations of skilled workmen not owning their tools, but working for employers whom they rarely if ever see, are very new; the universal freedom in the civilized world of unskilled labor is not a generation old; the right to buy and sell land as freely as personal property is new. Mr. Thomas Kirkup, a writer for the "Encyclopædia Britannica," has well said: "The present system of competitive industry, which to most men is so rational and familiar that they cannot even realize the possibilities of any other, is but of yesterday. Free private ownership of land, the free right to choose what industry you please, and to follow it as you please, have even in western Europe come into force only since 1789."¹

III.

EVILS.

LET us, in immediate connection with the foregoing, consider some of the evils of the

¹ "Inquiry into Socialism," p. 92.

industrial situation which have a close connection with the labor problem. Only brief comment will be possible, though a book might be written on any one of them.

Child Labor.

First of all must be mentioned child labor as one of the most fruitful sources of evil. Children are removed from home to the dangerous moral atmosphere of the store, shop, and factory at a tender age and their moral natures too often irreparably corrupted. How careful is every Christian parent of the well-to-do classes to guard the every step of his little children. No one may associate freely with them without the closest scrutiny. Companions of evil natures and low tastes are zealously kept away. Even the law does not recognize the full responsibility of children, and at an early age recognizes no responsibility at all, or only a very limited one. Full legal rights and responsibilities do not belong to a person before the age of twenty-one. What then must be the natural and legitimate consequences of thrusting out into the great world, among the vicious and depraved, young boys and girls? Intemperance and immorality are the fruits too often seen. Yet we have in the moral consequences only a part of the terrible evils which result from child labor in great factories. The children's bodies are stunted, and a weak generation of workmen and of mothers of workmen's offspring is the inevitable result. The mind is also dwarfed. Opportunities are offered to learn a few simple processes, and in these great expertness is acquired, but too often both mind and muscles refuse to learn new aptitudes after thirty. Normal growth is obstructed, and the very end of life, "the consistent and harmonious expansion of all one's faculties," is defeated.

Childhood should be a period of innocent play and of growing bodily, mental, and moral power. A normal childhood is a source of strength to one's entire life. The mind reverts to it and is refreshed. But in our great cities the children of the working poor are growing up without childhood. They leave infancy only to become little old men and women. They are wronged because not protected at a period when self-protection is an absolute impossibility. This is a matter of national importance, for as naturalists and economists both have shown, and as history has amply demonstrated, the source of permanent prosperity must be sought in the vigor of mind and body of the great masses. A successful national struggle for existence is otherwise out of the question, and decay must set in and a nation's glory depart.

Child labor is constantly increasing in the United States. The census shows that an ever-increasing portion of our population is engaged in gainful vocations, and that this increasing proportion is largely to be attributed to the labor of women and children. The reports of the various bureaus of labor statistics but confirm the census reports.

The number of children — boys under sixteen and girls under fifteen — who belong to the class of wage-earners, according to the census of 1870, was 739,000; in 1880, 1,118,000; an increase of 66 per cent., and this appears to fail to reveal the true increase, because the enumeration is acknowledged to be defective. The increase of employees in manufacturing and mechanical industries was 43 per cent. for adult males, 58¾ per cent. for children, and 64 per cent. for females. In twelve leading industries of this class women and children comprise a majority of all employed, and in some cases they have almost a monopoly. It is noteworthy that the evil of child labor increases most rapidly in our West.

These statistics are taken from a valuable article on the employment of children, by Mr. John T. Crowell, which appeared in the "Andover Review" for July, 1885. "If a child of a certain age," says one operative whom Mr. Crowell quotes, "goes to work in a mill, constantly breathing a temperature of ninety degrees both winter and summer, it is sure to grow up puny and die young." "Another stated," says Mr. Crowell, "that children put into the mill at an early age become useless at the age of twenty."

Generally the children go out of the home into the mill or factory or store, but occasionally the shop is brought into that which serves as a pretext for a home. This was the case with the manufacture of cigars in tenements in New York, the law abolishing which the Court of Appeals most unfortunately declared unconstitutional.

The Labor of Women in Industrial Establishments.

This, like child labor, is rapidly on the increase in the United States. It is not always an evil, but it is too often a most serious one, and it is desirable to restrict it. The wives and children of the laboring men become their unnatural competitors, and it has happened in Massachusetts and New Jersey, as well as in England, that the father has remained at home to care for the house and perform those duties which nature has assigned to woman, while wife and children are at work in the mill. Women become too often demoralized, and in mines so notoriously so that their employment

underground has been entirely prohibited in England. Children without a mother's care grow up wild and undisciplined, an easy prey to the worst agitators and other bad men! The question involved in the labor of women and children is no less than the preservation of the American home, the only sure foundation on which our institutions can rest.

It is noteworthy in this connection that, in this country and in others, those establishments in which the laboring classes are employed for the largest number of hours per week are precisely those in which the labor of women and children predominates.

The Dwellings of the Urban Laboring Classes.

This, like the labor of women and children, is a serious and perplexing problem in all nations of modern civilization. It is a live question in London and Berlin, as well as in New York, but nowhere is the situation more serious than in great American cities, and nowhere has so little been done to remedy it.

Men, women, and children crowded together in unsanitary condition, and disease is accompanied by a fearful death-rate. The conditions of a wholesome family life are almost entirely wanting, and virtue is gone and character is destroyed before their value can by any possibility be realized. The slums of cities are breathing-holes of hell, and the only way to reform them is to sweep them from the face of the earth.

"The mere endless persecuting opportunity" of the modern tenement house, to use the phrase of Mrs. Humphry Ward, is something which we have no right to expect feeble human nature to withstand.

Dwellings in cities are too far from work, and an hour or two is not rarely added to the working-day, thereby curtailing opportunities for cultivation and recreation. Formerly rent was a small matter for the greater part of the laboring classes, and frequently in the country a garden helped to eke out a living. Now the growth of cities makes rent for an increasing number consume an undue portion of the family income. Formerly the artisan in village or country readily acquired a home of his own. Now in our great cities this is a difficult, and at times an impossible, thing for him to do.

Sunday Work.

This is a rapidly growing evil in all our cities, against which workingmen all over the length and breadth of the land are crying out, and their complaint is becoming bitter because their cry passes unheeded. Wherever laboring

men meet in conventions this complaint is very apt to be heard, and labor papers agitate the matter perpetually. The barbers of Baltimore raised several hundred dollars to work an ordinance through the city council closing all the barbers' shops on Sunday, and this is now enforced, but workmen elsewhere have not often been so fortunate. In some trades in New York, and doubtless elsewhere, Sunday work is all but universal. A few years ago there was, for example, scarcely a photographic gallery in New York City — even if there was one, which may be doubted — which did not do more or less work on Sunday, though perhaps not openly; the great majority placed their show cases out for public inspection, and, making no pretense of observing Sunday, found that day the most profitable day in the week. A correspondent of "John Swinton's Paper" uses this language:

Is there any law in New Jersey in defense of Sunday? If so, why is it not enforced against the railroad corporations?

When laboring men violate any law of the money power, it is anarchy, and the law-breakers are imprisoned or hanged. But when the money power violates all laws, both human and divine, there is neither penalty nor remedy.

Look at the Central Railroad of New Jersey running coal trains every Sunday, compelling its employees to work upon that day. True, the trainmen get paid for their Sunday work, because they are paid by the trip or day. But the men in telegraph offices all along the line *are now compelled to work Sundays for nothing*. So with the flagmen and others who are paid by the month.

God knows it is hard enough to work for a mere pittance six days in the week, but it is intolerable to be compelled to work on Sundays for nothing, as we do — to desecrate the Sabbath and be deprived even of the boon of preaching. If this is not anarchy, what is it? And how much longer shall the Golden Calf rule in New Jersey?

An editorial in the Chicago labor paper called "Knights of Labor" is entitled "Sunday Slavery," and an extract from it reads thus:

A grand mass meeting under the joint auspices of the Chicago Sabbath Association, Butcher and Grocer Clerks' Association, and the Knights of Labor will be held at Central Music Hall, Sunday afternoon, October 14, 1888, to discuss the question of Sunday observance. Representatives from each of the above organizations, with other good speakers, will address the meeting.

The question of closing the factories, workshops, and stores on Sunday is fast coming to the front as one of the important questions of the day. From thirty to forty thousand employees in Chicago alone are compelled to work for seven days in each week. How shall their shackles be unloosed and the slaves set free? Men and women have been discussing this question as individuals for many months. It

is now time to discuss it as a body politic. . . . Is it not time to cry halt? Are the people, by their apathy, avarice, and selfishness, willing to blight the prospects of the working classes of America by condemning them to a slavery that knows no day of rest?

The secretary of the Journeymen Bakers' National Union sent out appeals to the clergy of New York and Brooklyn to preach against Sunday labor and help them to abolish it. Five hundred circulars were sent out, but little response was met with. In reply to a query as to their success, the disgusted secretary sent this answer to the writer of the present paper: "Out of the five hundred circulars sent to the clergy of New York and Brooklyn, half a dozen answered. You will have a hard time, Professor, to convince the toilers of this country that the clergy will ever do anything for them." The Philadelphia bakers, on the eve of appealing to the clergy of that city, wrote to the editor of their New York organ, the secretary just referred to, to get the results of their experience, but he dissuaded them from their project on the ground that nothing would come of it in Philadelphia, as nothing had come of it in New York.

The purpose of this is not to condemn nor to uphold the clergy, but simply to call attention to a widespread cause of discontent.

The spirit of the fourth commandment calls for one day's rest in seven, when for good and substantial reasons work must be performed on Sunday.

Night Work.

This has become quite common in order to utilize the expensive plant of the modern manufacturing establishment. It is demoralizing for all, men, women, and children, and for the two latter classes ought never to be permitted. It is an evil to be kept within as narrow bounds as possible for all. One needs but to travel through manufacturing districts at night to see how widely extended is this evil.

Overwork.

It requires a perpetual struggle to keep the length of the labor day within the bounds required by physiology and hygiene, and often the struggle to do so is unsuccessful. No nation in which modern industry prevails has been exempt from the evils of overwork. Working days of fifteen, sixteen, and seventeen hours have not been infrequent, and cases are occasionally reported of men working for more than twenty-four hours in succession. This used to be the case with bakers in some cities once a week, and we hear of such things on steam railways, whereby life and limb of employees and the traveling public alike are en-

dangered. Street-car employees have suffered in this way from corporate greed in all great cities. The labor day exceeded seventeen hours for street-car employees in Baltimore until 1886, when the legislature reduced it to twelve. Excessively long hours weaken the nervous system and create a craving for stimulants. It has been generally observed that shortening working hours leads, after a brief interval, if not immediately, to diminished intemperance. Another evil effect of an excessively long working-day is that the head of a workingman's family is thereby rendered incapable of performing his duties as the father of a family and as a citizen.

Excessive Mortality of Working People, especially of Children.

The influence of occupation and economic condition upon length of life has never been sufficiently investigated, but all investigations which have ever been conducted point with unmistakable clearness in one direction. There is no popular impression more entirely groundless than that the poor are blessed with good health. Physicians who work among the poor and in hospitals know well that such is not the case. Perhaps the burdens which they bear convince people that they must be strong because they ought to be. For example, we often hear from American travelers a good deal about the robust health of German workingwomen, but an American lady who has worked among them in hospitals says that they are nearly all diseased, while it is well known that among German day-laborers in portions of Germany less than ten per cent. can pass the physical examination for the army.

The most careful investigation as yet made into the effect of economic condition on mortality is that of Körösi, Director of the Bureau of Municipal Statistics of Buda-Pesth, who divided the population of that city into three classes, rich, well-to-do, and poor, and had an examination made of every individual case of mortality. Excluding the children under five, among whom mortality is very great in the families of the poor, he found that the rich lived about ten years longer than the poor, and some five years longer than the well-to-do. English investigation about 1842 revealed a difference of from ten to twenty years—in cases more—in favor of the rich and professional classes as compared with the working classes.

Among the children of the poor in New York over five hundred, at a moderate estimate, have died needlessly in one week—five hundred, that is to say, who would have lived had the conditions been what they should have been.

The chief health officer of Maryland calculates that two-thirds of the deaths in that State are needless. Careful investigations are wanting in the United States, but it is generally remarked that workingmen with white hairs are comparatively rare. The mortality among the negroes in the South, in some places, at least, appears to be nearly twice what it is among the whites. The negroes are nearly all of the laboring class, but many of the whites are also of the same class. On the other hand, a race problem complicates the question.

The poor lack the means to guard their health, and their ignorance also shortens their life. Hazardous employments frequently produce recklessness. Certain occupations are more disastrous than army life.

One of the most distinguished statisticians of the century, Dr. Ernst Engel, says that the chief cause of death is social. In themselves the diseases of which men die are for the most part curable, but the resources to provide the means of cure are lacking. Does a physician tell a workingman suffering from consumption to take a year's rest and go to Egypt, even if he knows it would cure the disease?

Immigration.

Excessive immigration of foreigners, often of a low class, is a serious evil for American workingmen. It tends to degrade them and to make them socially less esteemed. These heterogeneous elements are unable to unite peaceably for the attainment of common ends. This renders workingmen weaker in all industrial struggles, at the same time that it inclines them more readily to the use of violence. We thus find all sorts of currents among this strange conglomeration, and a lack of harmony dangerous to the entire social structure. American workingmen, it is frequently observed, are inclined to respect the rights of others, are slow to use violent measures, and, nevertheless, when not interfered with, generally know well how to attain just ends in a peaceable manner. Whether or not this is quite a correct observation, the evils of excessive immigration are undoubted.

Disadvantages of a Division of Labor.

The division of labor is a necessity in our present industrial life. Nevertheless we should not be blind to its dark features. Some of these have been already mentioned. It develops one-sided men who exhibit an excessive dependence upon employers. They lack the suppleness, so to speak, of the early Americans. They are not quick to turn hither and thither and seize industrial advantages.

VOL. XXXIX.—130.

A memorable remark of M. de Tocqueville attributed the superiority of Americans fifty years ago to precisely the absence of that division of labor now carried so far with us. These are his words:

It sometimes happens that the same person tills his fields, builds his dwelling, contrives his tools, makes his shoes, and weaves the coarse stuff of which his dress is made. . . . This contributes powerfully to awaken the intelligence of the workman. Nothing tends to materialize man and to deprive his work of the faintest trace of mind more than the extreme division of labor.

We may further observe the separation which it brings about between employers and employed. Formerly in manufactures they belonged to one social class, and even in this present century in New England it was a common practice for the apprentice to live in his master's family. Now, often, they rarely see one another — sometimes never meet.

Corporations and Trusts.

These increase the separation already noticed, and large aggregations of capital acquire a dangerous control over the lives of employees. Vast combinations of capital lead in turn to vast combinations of labor, and in their contests the public welfare is seriously involved.

Inventions and Discoveries.

The benefits of these are well enough known. They also unfortunately too often reduce the skilled workingman to the ranks of unskilled labor. This evil has been already mentioned.

It should ever be remembered that while labor is a commodity, it is unlike other commodities in the fact that it is inseparably bound up with a human being, and direction over labor in so far carries with it control over another's will. This manifests itself in the tyranny of unscrupulous employers over the politics and social life of the working classes, occasionally even over their religious life. The employer chooses the place of residence and, for the greater part of the working-day, the companions of the workingman. If the laboring classes attempt to control the selection of their companions, it is, according to the decision of the New York Court of Appeals, a penitentiary offense—the refusal to work with objectionable fellow-workmen being construed as a criminal conspiracy!

Accidents.

These occur in large numbers and increase the class of helpless widows and orphans. It

is estimated that in England seventy-six per cent. of all accidents occur in industrial pursuits. Women and children are specially liable to accidents, and law has done less in this country than elsewhere to protect life and limb of the working classes. Probably no railways in the world are so destructive of life of employees as the American. Over 2000 employees were killed and more than 20,000 injured in 1888. Their peril is spoken of by President Harrison as being as great as that of a soldier in time of war. This loss of life can be prevented, but money is valued more highly than human life, and it would involve expense for improved appliances. Elsewhere we find employers' liability acts, but they are with us few and imperfect, and the tendency of our courts is to decide against workmen in suits for damages. The New York Court of Appeals has so decided in case of accidents due to fellow-workmen.

Moral Evils.

These have already been incidentally mentioned. Churches have left overcrowded workmen's quarters, and spiritual oversight and culture are withdrawn.

The family life is of a low type. Immorality is frequent. Marriages are thoughtlessly contracted at an early age, and the duties of parenthood are entered upon without any appreciation of their gravity. Parents neglect children, and later children neglect parents.

The liquor saloon presents a never-ending temptation to those who live in labor quarters, while the modern city is almost wholly devoid of opportunities for wholesome, life-giving recreation for the poor.

Insufficient food, more often insufficient variety of food, and poorly cooked food create a craving for strong drink and promote intemperance. One of the first physiologists in the land is authority for this.

Girls are not trained to be housewives, and knowing nothing about cooking, sewing, or the care of the house, the dwellings of the poor present a cheerless appearance.

Too few opportunities for saving exist, and these have too often forfeited the confidence of the masses. This and other causes produce thriftlessness.

Class hate has been nourished by the struggles of social classes, and bitterness takes the place of affection and friendly intercourse. Both employers and employed must bear their share of the blame; the former the larger share because their opportunities are greater. Employers too often look upon their relationship with their workmen as one of contract only, and fail to see that an opportunity to do good

carries with it an ethical obligation to embrace the opportunity.

A general widespread lawlessness is both a cause and a symptom of disease. Law too often would seem to be obeyed only when it is convenient and meets with the individual approval of the citizen. The highest and lowest classes sin most in this respect, but a true reverence for law is rarely found anywhere. That those in authority are "ministers of God" has become an empty formula. The disastrous and growing habit of the employment by corporations of armed bands of hirelings must be noticed as an anarchistic tendency. We may likewise mention as a serious evil, producing hatred and bitterness, the employment of spies and informers, with whom the ranks of laboring men in the United States are honeycombed as nowhere else in the civilized world.

"The sure and steady increase of imprisoned criminals" is an expression used by Hon. T. R. Brockway, and this is only the logical outcome of the state of things described. The following statistics, even if accepted, as they should be, *cum grano salis*, are corroborative:

In 1850	there was	one prisoner	to every	3,445	of the population.
" 1860	"	"	"	"	1,649
" 1870	"	"	"	"	1,172
" 1880	"	"	"	"	855
" 1880	aggregate	70,077	prisoners,	and without counting juvenile delinquents,	58,609.

IV.

REMEDIES.

THE evils described will suggest many of the remedies required for the diseased social body, but these remedies must be enumerated and described in the fewest possible words. Other evils than those mentioned will also be brought forward incidentally in the treatment of remedies.

Optimism.

Perhaps one of the first things to be done is to vanquish and utterly drive from among us an ignoble but too common optimism, which blinds men to actual conditions, deadens conscience, and puts a stop to useful activity. This popular optimism of the day would have us believe that all things are as they should be, and bids us eat, drink, and be merry while our fellow-men are enduring such evils. This unworthy optimism is a lie, and surely those who keep it going are doing the devil's service. From the rise of the first attempts to bring God's will to pass in this world until now it has stood athwart the path of progress. Weak and imperfect as man is, it would be strange indeed if in this one department of social life which we are considering—the industrial field—he had attained perfection, while art, religion,

the family, literature, and politics are sadly faulty and defective.

Sin, misery, and injustice everywhere abound, and all who try to be guided by ethical and Christian principles must strive uninterruptedly with all their resources to remove or mitigate these. While this ignoble optimism is rejected, we find as little occasion for pessimism. Progress has been made by those who in the past have suffered and toiled for humanity, and the field for reform was never more promising than to-day.

It can scarcely be necessary to say that the attitude of mind for the study of the labor problem should be a sympathetic one. "The heart lying dead, the eye cannot see," says Carlyle truly. The personal concern of economists for the welfare of the masses is not an altogether untrustworthy test of the correctness of the economic theories they advance. It is the business of life to perfect one's own personality by the development of all one's power, and also to strive unceasingly for the perfection of humanity. The two ends are not incompatible. Even were the labor troubles of the day all due to perversity and wrong-headedness on the part of the laboring classes, a thing quite inconceivable, it would but show the more strongly the need of missionary work of all kinds among them.

It is true that many evils are due to ignorance and that this ignorance is common to all classes. Enlightenment is one of the prime needs of the time.

The Church.

To establish a legitimate authority over the minds and wills of men, the Church must show the Christian faith and love of early Christianity—light for all and love for all from the ministers of the gospel will alone reestablish that authority which makes the Church what it should be, a healthy life-giving member of civilization.

Individual and social moral virtues and excellences must be inculcated; against indulgence and material luxury should be set self-denial and simplicity, and those who occupy high station should lead in this. The Church finds part of her work in incitements to correct conduct, but her work should be more positive and should take hold of the life of men more directly and in more ways than at present. She is too modest in the territory which she claims for herself, and practically too much inclined to admit that there are secular concerns and secular days with which religion is not vitally concerned. The spirit of caste which separates man from man and produces mutual hatred is a chief cause of troubles, and against this headway must be made. But if the Church is to exercise control over social life, her

ministers must understand this social life far better than they do, and this requires instruction from the best minds of our time. Social science should be pursued in every seminary for the training of ministers of religion.

The Family.

Perhaps a reform, purification, and elevation of the family ought to be placed first among remedies for labor problems—certainly it is among the first; and how far-reaching and diverse are the efforts needed for this purpose, what has already been said will indicate. The reforms which the family institution needs must be brought about partly by individual effort, partly through the effort of voluntary associations like the Divorce Reform League, partly through the Church, and partly through legislation and the action of government. One cause of labor troubles is imprudent and hasty marriages, also marriages at too early an age, resulting in feeble offspring, poorly cared for. It is the duty of all public teachers to impress upon the minds of the young the gravity of the duties which marriage brings, and to enforce in every way the responsibilities of parenthood. Among large classes of the community it is not realized that it is a grievous sin to bring children into the world without a prospect of means to bring them up properly.

Improved Educational Facilities.

Improved educational facilities are greatly needed, but our schools have not kept pace with the demands on them. A recent writer observes that American common schools were the best in the world thirty or forty years ago,—a doubtful statement,—but that now other countries, like Germany, Switzerland, and England, are far ahead of us. The last part of the statement is true. While in the self-complacency of optimism the American eagle has been deafening us with his screams, other countries have been slowly but quietly improving their schools, and we have stood still or made but slight advance. Even such schools as we have are not sufficient to accommodate the children who desire to attend, and in cities like Chicago, Richmond, and New York children are turned from the school. But the demands on the schools have increased with the growth of cities and the division of labor. The old apprenticeship is antiquated and must be replaced by manual training and industrial schools. Girls ought also to be taught sewing, cooking, and other useful womanly occupations. Preparation for life must come to an increasing extent through the school.

Compulsory education laws should every-

where be passed and enforced as in other civilized countries. Education is a right of a child,—the right to existence carrying with it the right to an opportunity for an unfolding of its powers,—and if parents fail to do their duty it only remains for the state to step in and protect the child. This is a more sacred duty even than the protection of property, for property is but a means to an end; namely, the welfare of man. It is not an interference with the rights of the parent, but a protection of the rights of the child. Compulsory education should continue in ordinary schools until the age of fourteen, and be followed by continuation evening classes for three years, as in parts of Switzerland and Germany, where they have almost annihilated pauperism. Instructive are these remarks quoted from Mr. Samuel Smith, M. P., who has made a study of common schools on the continent of Europe. The quotations are taken from an article which appeared in the London "Times." Speaking of Germany, he says:

There is no such thing as an uneducated class; there are no such things, speaking broadly, as neglected and uncared-for children. . . . The great defect of our system [that is, the English system] . . . is that it stops just at the time when real education begins. It allows a child to leave school at an age when its learning is soon forgotten and its discipline effaced. It is hardly too much to say that the two years' additional training the German child receives in the elementary school doubles its chances in life as compared with the English child. . . . The Germans are rapidly developing a system of evening continuation classes which carry on education for two or three years longer. In Saxony the boys who leave the primary school, if they do not go to the higher schools, must attend for three years longer—say until they are seventeen—continuation classes for at least five hours per week, but teaching is provided for them and they are encouraged to attend twelve hours per week. So complete is this system that even the waiters at the hotels up to the age of seventeen attend afternoon classes, and are taught one or two foreign languages. . . . I must state as an undoubted fact that in Germany and Switzerland, and I believe in some other continental countries, the opinion is ripening into a conviction that the education, even of the poorest classes, should be continued in some form or another to the age of sixteen or seventeen. They find that wherever this is adopted it gives an enormous advantage to the people in the competition of life, and, above all, trains them to habits of industry and mental application. I believe that it is owing to this system of thorough education that Germany has almost extinguished the pauper and semi-pauper class, which is the bane and disgrace of our country. . . . Indeed, I have not seen since I left home a single case of a ragged or begging child. . . . No country has ever suffered more from the abuse of individual liberty than England has done. Owing to this overstrained idea, we did not get compulsory education until long after the advanced nations of

the continent. . . . Wherever the Germans and English are coming into competition upon equal terms the Germans are beating us. . . . We, up to lately, resented all state interference, and so exaggerated the doctrines of freedom as almost to glory in our abuses.

Private effort never has and never can carry forward universal education. Private gifts for educational purposes in the United States may amount to six or seven millions of dollars,—a large part of it, as the president of Cornell has shown, misapplied and wasted,—whereas the very inadequate expenditure of New York State alone is some sixteen millions a year. It is safe to say that we should spend three times what we do on our schools. Means for this can be secured by husbanding our resources, cutting off needless expenditures, and improving our system of taxation.

Private individuals should continue to supplement public education and to take the initiative in reforms and experiments, doing in general what the taxpayers cannot be persuaded to do. This is sufficient to occupy private philanthropy. Efforts like the Chautauqua reading circles deserve the heartiest support, and these should be supplemented by a system of university extension lectures, giving to grown people instruction on economics, ethics, literature, natural sciences, etc., and thus drawing closely together the masses and the highest institutions of learning to their mutual benefit.

Dwellings of the Poor.

Stricter sanitary laws are required, and a better organization of the sanitary administration of cities. Houses unfit for habitation should be torn down, and small parks provided to give breathing-places for the crowded sections. The beginning made in New York City deserves commendation. While not prepared to recommend at present the construction of houses by the municipality, we regard English experiments in this direction as worthy of study. Private philanthropy should concern itself more than heretofore with the dwellings of the poor and strive to make them fit for human beings. It is a sad commentary on our Christian civilization that when there is more than one man in New York City claiming to be a Christian who, alone and unaided, could reconstruct the entire tenement-house district or districts of the city, the unspeakable wretchedness and squalor of its slums continue almost unabated.

Factory Laws.

These have produced excellent effects wherever they have been honestly conceived and honestly administered. With us they have too often been a mere sham and farce. Unfortu-

nately in this matter we have lagged behind the rest of the civilized world. We recommend an adequate system of factory inspection by men of character — not political demagogues — and by men who have been trained for such work: further, heavier fines and even imprisonment for a violation of factory laws.

These laws should include protection against dangerous machinery, sufficient fire-escapes, and satisfactory sanitary arrangement.

It appears that, in the main, factory laws should concern themselves with women, children, and young persons; not, as a rule, with grown men. No one should be permitted to work in a factory before the completion of the fourteenth year; and up to the eighteenth, as well as for women, only fifty-four hours a week should be allowed, as in England. Physiological reasons and the interests of the home require this. It is to be observed that no country or portion of a country ever yet suffered in competition on account of short hours. When they were being introduced in England, the ruin of English manufactures was predicted, but after their introduction England became more prosperous than ever. It was said that the ten-hour day would drive capital from Massachusetts, but larger sums were invested in manufactures after the law went into force than ever before. The calamities predicted in Rhode Island have not been realized. It is curious that never in the world's history have shorter hours been introduced without prophecies of terrible evils and that never once in the world's history have these prophecies been fulfilled. If we arrange in a line the names of the countries, placing them in order according to the number of hours worked per week, we shall find that the country with shortest hours is most dreaded in international competition, and as we go down the line we shall find longer hours mean increasing weakness in international competition, and that with few, if any, exceptions, countries with long hours and poorly paid work always seek protection against countries with few hours and highly paid work. Factory laws do not prevent competition or weaken it, but simply raise its moral level in the manner described by Prof. Henry C. Adams in his monograph "Relation of the State to Industrial Action."

There may be instances, as in the case of street-car employees and steam-car employees, where the hours of labor for men should be regulated, but this is an exception. We may, however, lay down the general principle that interference with corporations, creatures of the state, may properly go further than with individual employers.

Employers' liability acts simply render employers responsible for the management of their

own affairs, and should become universal. We may further lay it down that we have come to a time for a higher development of laws protecting the person, shielding it, guarding it and all its capacities. Law has heretofore too exclusively been occupied with things.

Administration of the Law.

This ought to be reformed in the direction of civil service, and this is, in its indirect bearings, a labor question. It ought to be firm but just. The letter of the law is equal, but he would be a rash man who would claim equality for its administration. This embitters the laboring classes, who feel the chicanery of law pressing on them. Police brutality in too many cities, and particularly in New York, has made extremists of once moderate reformers and ought to be stopped at all hazards. Already has American police brutality attracted the attention of foreigners. Responsibility should accompany power.

Labor Organizations.

Labor organizations ought to be carefully studied and their nature understood. They must exist, and to harass them by injustice, as is being done too often by our courts under revival of obsolete laws and constructions, will inevitably lead to their degradation. A frank recognition of their necessity, an encouragement of all that is good in them, and repression of the evil, ought to be our aim. In the labor movement we have a stream which can be guided, but which cannot be dammed up with impunity.

Public Property.

There is a call in every city, every State, and in the nation for public property defense leagues. It is by protecting the property of the public, that is, of the masses, that we shall secure general respect for the institution of property. The work of public property defense leagues would be, among other things, to guard public domain, public parks, and to secure for the public the full value of public rights, like the right to use streets by horse and electric cars, elevated roads, etc. The property of the public should be paid for and protected like property of individuals. Had that been done in the past, we should in our great cities have had three-cent street-car fares before this or large public revenues from street cars.

Savings Banks.

These occupy an important position in any programme for reform. Without thrift the masses can never prosper, and this must be cultivated by savings banks of undoubted se-

curity. Private banks must be rendered secure, and, where practicable, state and municipal savings banks started. It would be well to have the debt of a city like New York held in small sums by the masses. This would also give them a "stake" in the city and produce excellent political effects. The admirable municipal savings banks of Germany deserve study. Should our National Government again have occasion to borrow money it is to be hoped that national postal savings banks will everywhere be established.

Immigration.

General laws to keep out contract labor and all the most degraded and ignorant foreign elements are heartily to be recommended.

Monopolies and Corporations.

The question of monopolies and corporations is a serious one. They have helped to make the labor problem assume its present dimensions, and that in many ways. Unlawful methods, such as "cooking accounts," declaration of unearned dividends, and the like, have defrauded tens of thousands, and have increased thereby the dependent classes. There is not a city in the United States where widows, orphans, and workingmen have not suffered by corporate dishonesty. Legislative corruption has been by them developed, and despair of honest government has nourished revolutionary and even anarchistic sentiments. Monopolies have their agents in all our legislative halls, municipal, State, and national; bills are stolen from files, and legislators and judges are bribed. One form of bribing has become almost universal, and that is the free pass on street-car lines and steam railways, and telegraph franks. Popular rights are defied, and public property too often stolen with impunity.

The remedies for these evils are of diverse kinds. First of all, the general corporation laws require reform in such manner as to secure individual responsibility of managers. Both civil and criminal remedies must be provided. Publicity and accountability are two proper demands. Experience shows that, where there is a determination to do it, measures can be adopted whereby it will be possible to place responsibility for corporate acts upon some one individual and to punish him like any other wrongdoer. Our national banking law may be recommended as a model for a general act of incorporation. It does not appear that further restrictions for agricultural or manufacturing corporations are required.

But what about natural monopolies, like gas-works, water works, electric-lighting works, telegraph companies, and railroads of various

kinds? These undertakings, according to English and American law, are public in their nature, but there are two methods of management; namely, public management and delegated management of a corporation. Corporations become quasi-public agents and subject to control. We may fairly ask the question, in the light of experience, whether a satisfactory management by delegated agents is possible. There is no experience to show that it is. The agent becomes stronger than the principal, and a most disastrous struggle between public and private interests ensues. This inevitably leads to corruption. May it not be better by direct public management to draw a sharper line between the spheres of public and private activity? Wherever this has been done the result has been most satisfactory. No town ever yet regretted, for example, the purchase of private gas or water works; this is a rule without one exception the civilized world over. We thus separate on rational principles the sphere of the individual and the state, and erect a barrier against the progress of socialism. We at the same time coördinate public and private duties and provide a sphere for talent in both fields. Our life becomes a richer and fuller development. This is in accordance with the principles of self-help. The public bodies help themselves, municipalities providing themselves with water, gas, etc., instead of weakly calling on others—private corporations—to perform what are properly public functions.

The weakness of States and cities is well known. They are unable now to protect individual rights. Not a city in the Union is strong enough to force street-car lines to lay properly grooved rails; on the contrary here, all infringe on the rights of owners of carriages and other vehicles. Not a State in the Union is strong enough to protect the traveler by foot or by horse against dangers from steam railways crossing highways at grade. Not a State in the Union is strong enough to make corporations bear their due share of public burdens. A struggle always goes on between corporations of a monopolistic nature and public authorities, and it lies in the very nature of things. Human nature is not good enough for our methods. We have developed paternalism of corporations, for which we should substitute, so far as this can be done, municipal, State, and national self-help. A beginning ought to be made in local governments. When they learn how to manage their own affairs it will be easier for State and nation to perform all their legitimate functions. It might perhaps then be possible even to leave railways in the hands of corporations, instead of placing them directly under the management of the Federal Government; but at any rate, by

people of each locality beginning with reform at home, we should be best prepared for the future, whatever that may bring.

There can be no surer way of improving administration than by making it of some vital importance.¹

Other Remedies.

Other remedies can only be mentioned. Amusement is of an importance increasingly recognized. Playgrounds for children come under this head, and these should be provided by the public when private initiative is wanting. This would prevent crime, and thereby lessen taxation. Every teacher of college boys knows that if a legitimate opportunity for the vent of animal spirits is not provided mischief will come. City boys have, however, no opportunities for innocent play, and mischief too often degenerates into bad habits, intemperance, crime.

Public libraries, like the Enoch Pratt library, which has done so much for Baltimore, ought to become more numerous.

A reform of taxation has already been alluded to. Present State and local taxes are, according to unanimous testimony, unjustly distributed, bearing most heavily on the poor and on people in ordinary circumstances, those who are barely well-to-do. Besides, they obstruct industry and diminish opportunities for employment.

A further development of labor bureaus may be mentioned, these to be managed by trained experts, and not by demagogues used as baits to catch the labor vote.

Arbitration and conciliation have accomplished great things in some places and ought to become more general. It would be proper to make these methods of settling controversies compulsory for corporations. It is entirely a matter of expediency.

We are not prepared to indorse compulsory State insurance like that which obtains in Germany, but we recommend the subject of insurance against accident, sickness, old age, and incapacity to general consideration, in hope that some plan may be devised for accomplishing so beneficent a purpose by ways more in consonance with American ideas. A development of fraternal beneficiary societies and of in-

surance features of labor organizations, with examination of accounts by insurance departments or by a competent registrar of friendly societies, is certainly desirable.

Profit-sharing, when introduced by upright and prosperous employers, unites their interests with those of their employees most advantageously. Still better is it when laborers like the Minneapolis coopers themselves become capitalists and self-employers by placing in a common fund their savings and managing their own business. This always promotes thrift and temperance, and shows its highest success in the making of men.² The prudent encouragement of coöperation deserves commendation.

Our ideal is a social state, not of equality, but of equal opportunities, giving to each the means for the development, complete and harmonious, of all his faculties. Not the self-made man — that is, the self-made millionaire — can ever be a model for the masses, but the contented and really prosperous artisan or mechanic, gradually getting ahead in the world, enjoying life, developing all his powers and living worthily with his family, partaking according to their capacities of the blessings of civilization.

Social democracy is a disease. It shows that the masses have been left to themselves to work out the problems of industrial civilization, and they are not equal to the task. Our goal can be reached only by the harmonious working together of all classes, and whenever leadership falls out of the hands of the highest and best it shows disease. The laboring classes know their friends and will willingly follow culture and wealth, provided culture and wealth are wise and virtuous and show sincere devotion to their interests. The testimony of men like the seventh Earl of Shaftesbury bears witness to this, and Professor Brentano says that before the anti-socialistic law was passed in 1878, even the German social democrats — save, perhaps, a few insane extremists — were always ready to listen to a manly and sympathetic word, even from one who differed with them. We who write this paper have, in our experience with American workingmen, found abundant confirmation of this testimony. Let those who are fit for leadership assume leadership.

Richard T. Ely.

¹ Mr. Low's opinion of that part of the present paper which treats of the duties of government is expressed in these words: "I have not studied the subject as widely or as deeply as Professor Ely, and I do not know that I am prepared to commit myself definitely to the principle which he has put forth as he has done. At the same time I am free to say that the result of my experience in the mayor's office, for four years, has been to change the whole current of my thoughts,

which formerly ran away from that conclusion, towards it; and if, upon study, I should find the facts conform as generally as he does to his claim I should certainly be willing to stand with him. I do believe that this is the direction in which our cities must grow, even if they have been wise in beginning upon another plan."

² See Albert Shaw and others in "Coöperation in the United States," published by Johns Hopkins University, Baltimore, 1888.

TOPICS OF THE TIME.

Longer Terms and Less Rotation.

THE first impulse of democracy was against long terms for anybody, and against many terms for the same man. John Adams held that "where annual elections end, tyranny begins." When the Federal Constitution was framed, South Carolina was the only State which had the biennial system, while Connecticut and Rhode Island held elections half-yearly. There was no little opposition in the convention to the idea of choosing representatives in Congress for so long a term as two years. The people had a great dread lest their servants might become their masters if they did not reserve the right to call them to account at very short intervals.

Experience showed that the fear was groundless, while the disadvantages of frequent elections for brief periods became more serious with the growth of the country. The ancient superstition as to the danger of tyranny without annual elections had largely vanished before the war, and no remains of it any longer survive. The drift has been everywhere and steadily in the direction of longer terms, until Massachusetts and Rhode Island alone among the forty-two States now choose all their State officers and their whole legislatures every year. Of the other forty, no less than eighteen choose governors for four-year periods, and two for three years, while two years is the rule in all the rest. Outside Massachusetts and Rhode Island, New York and New Jersey are the only States which choose representatives in the legislature every year, and in almost two-thirds of the States the Senate is composed of men who serve four years, both branches in Louisiana being chosen for that long period. Over two-thirds of the States have sessions of the legislature only every other year.

Complaints are heard of some of these changes, but there are nowhere any indications of a revolution in public opinion. Such discontent as exists appears to prevail chiefly among the class of professional politicians, to judge from the recent experience of Maine, where a proposition which they had persuaded the legislature to submit to the people for a change back from biennial to annual sessions was rejected by a vote of six to one. All the signs indicate a settled conviction in favor of longer terms and fewer sessions of the legislature than formerly, on the twofold ground that executive officials chosen for two, three, or four years are likely to give the public better service than if compelled to appeal to the people every twelve-month, and that there is less necessity for frequent overhauling of the statute-books in long-settled States than in pioneer communities. Where the legislature meets only once in two years, the people are apt to say that there does not seem to be a great deal for it to do, and the press generally deprecates the tendency to make too many laws. The legislator who says, as one in Arkansas did not long ago, that he is "opposed to a

great many things and in favor of very few," makes a strong bid for popularity.

Along with this change in the direction of longer terms in the States has gone, another change in the matter of "rotation of office" as regards members of the Federal Senate and House. The rotation rule was based upon two theories: the one, that reelection tended to make the representative in Congress too powerful, too insensible to the wishes of his constituents, too ready to yield to the temptations of aristocracy and corruption; the other, that a seat in the Capitol at Washington was an honor which should be enjoyed by as many men in the district as possible. It would not do to return A for three, four, or five terms, for fear that he might become too "high and mighty"; and even if there were no such danger, A ought not to retain the place so long that B, C, and D would have no chance to become great men.

Both theories proved to be erroneous. No representative could become so strong that the people who made him could not unmake him, and self-interest thus restrained any tendency towards overriding the public will. At the same time it became clear that the office should not be treated as a mere badge of honor to adorn as many breasts as possible, but as a means of securing as efficient service as possible. A district gained power in the national councils by keeping a good man in the House when it had once put him there, and a section most of whose representatives were old members enjoyed a great advantage over another where it was always the question whose "turn" it was next to go to Congress. The South was quick to perceive this, and profited largely by the discovery before the war. When, as in the Twenty-first Congress, Virginia reelected 17 out of 22 representatives, and New York only 11 out of 35, the smaller State might easily wield the more power of the two. Since the war there has been a growing disposition all over the country to reelect good men. Thus in the Fiftieth Congress, of Maine's four representatives one had served six terms, another four, and the other two each three; while of the five from Arkansas one was serving his fifth term, three their third terms, and the other his second.

The same tendency is perhaps more strikingly shown in the Senate. As the largest State has but two senators and the term of office covers six years, it might be expected that the rivalry would be so keen that a first reelection would be difficult to secure and further ones almost impossible. The reverse is the case. Twenty-five senators had been elected for the period opening the 4th of March, before the New Hampshire legislature met in June. In two States political revolutions deposed the man whose term was approaching a close; in a third he declined an assured reelection. In all but two of the other twenty-two cases the sitting member was returned for another term. Nine of the number (five from the South and four from the North) were

sent back for a third term, and one (from North Carolina) for a fourth term. Still more noteworthy is the fact that in a large majority of the cases there was no opposition in the party, even when it was a question of a third term. Evidently, as regards the Senate, "rotation of office" no longer applies, and it is a great gain to the country.

"The People."

TRUTH and soberness seem to be of much less importance, in the eyes of many men, than a good, round, mouth-filling phrase, such as that which heads this article. It was their representative character in this respect which has given perennial notoriety to the three tailors of Tooley street, who, in mass convention met, began the formal expression of their dissatisfaction with the sounding phrase, "Resolved that we, the people of England." They wished to make a phrase take the place of argument, and to assume popular support for themselves without the trouble of an election. Most of us are but too apt to take for granted that our personal views are shared by the people, and, like the Tooley street convention, to expect our opponents to admit our representative character. But such cases are individual; there are some cases in which the use of the phrase "the people" as a political weapon has become that of a class which it is dangerous to permit to pass without remonstrance.

One of the commonest of these cases is the assumption that, unless the President and the other officers of the Executive Department surrender their official time to the work of estimating and balancing the "claims" of the various applicants for appointment to office, "the people will be dissatisfied, and the Administration will be a failure." It is not very difficult to show that those who say so are using the name of "the people" to embody their own feeling and to give it something of respectability. "The people," in any legitimate sense of the term, care nothing whatever about the matter unless some partisan use of the offices is forced upon their attention, and then their attitude is, regularly, one of contempt or condemnation. We may take all the offices in the civil service, multiply their number by the average number of applicants for each, and add the present occupants, who are to be turned out to make room for successors, and the sum total of those who have a selfish interest in the offices will be small; there is fair reason for doubt whether it would make up five per cent. of the voters of the country. The remaining nineteen-twentieths, of both parties, have their daily work to do; could not be persuaded to accept an office; and have nothing but contempt for the unseemly scramble in which the minority is engaged. Is not the application of so sweeping a term as "the people" to this little five per cent. of office-hunters rather an absurdity? In practice, the case is really even worse than this. Out of every five persons,—the average number interested in any one office,—one is turned out, one is appointed, and three are disappointed; here are four very angry men and one who feels no great store of gratitude. Suppose the civil service thoroughly overhauled from top to bottom, and new appointments made to every office. Nineteen-twentieths of the voters, as has been said, care little or nothing about the matter; and of the little minority who do care, four-fifths come out of the

process inflamed by a personal sense of gross injustice. Who, then, are "the people" who are supposed to be satisfied only with such a state of public affairs as this? If any such use of the term were made by men who were not "practical politicians," what an outcry would there be against the impudence of the assumption!

Again, the stock objection to the system of appointment to office through examination of some sort is that the offices "belong to the people," and that the "people's right to the offices" is not to be restricted by an artificial and aristocratic scheme of examinations. The objectors disclaim all selfish thought or purpose, and it is quite true that they very seldom have the least desire to secure the offices for themselves; their only interest, they insist, is on behalf of "the people." The phrase, in this use of it, cannot mean the mere possessors of the offices; these, as we have just seen, are not probably more than one per cent. of the whole number of voters, and it would be ridiculous to call them "the people." The real question, then, must be who shall put the one per cent. into the offices; and experience will enable us to answer that question quickly, easily, and correctly. Under the old system, did the whole number of voters select the one per cent. who were to become office-holders? Was the selection the privilege even of the voters of the successful party? Notoriously, the people, the voters of the country, had no rights in the premises. It was the "practical politicians," the men who controlled the nominating machinery of the country, who controlled the appointments also; and that is just the system which they, and those who are ambitious to be of their number, wish to maintain. When they say that they wish the offices to "belong to the people," they mean that the Government shall take no steps to prevent them from wresting the control of the offices from the people, and that both offices and people shall be left defenseless at their mercy.

Again, it is said by those who oppose the efforts to secure absolute secrecy of the ballot, that they are defending the right of "the people" to approach the polls and cast their ballots without Government interference. So far as the act of casting the ballot is concerned, it must be confessed that the provisions of the so-called Australian system are so carefully drawn, and so fortified by all the suggestions of long experience, that almost no one—not the blind, the dumb, the halt, or the illiterate; only, presumably, those of very low intelligence—could be deprived of the privilege of the suffrage under it. It must be meant, then, that the new system (new to us, but very old elsewhere) tends to make the act of voting unpleasant, and that an open ballot is in some way a boon and benefit to "the people." Who, then, are "the people" who find their account in retaining the open ballot and all the features which it has forced into the present system? The vote-buyer, the vote-terrorizer, the "boss." These are "the people" on whose behalf the "practical politician" becomes superhumanly astute in picking flaws in the lawfulness or the expediency of every suggested plan of real ballot reform. To resist legal restrictions upon the mere act of casting the ballot may easily be paraded as a sublimated devotion to "the people"; it is really flinging to the people privileges which do them no good, but which accrue to the benefit of the vote-buyer or vote-terrorizer.

The principle is the same in every such case. When any right or privilege is of such a nature that the people cannot retain possession of it if it is left to them, while a small class of selfishly interested persons can seize and hold it if it is left open for a general and unrestricted scramble, it is the evident business of the attorney for the interested class not to appear for his real clients but to enter a volunteer appearance on behalf of "the people." It must be evident that this is a method which has large possibilities outside of politics, and that there are other fields in which selfish personal ends may be pursued best under cover of democratic benevolence. We may expect soon to see a national convention of burglars and bunco men, to protest against the restriction of judicial and kindred privileges to police magistrates and constables, and to demand in the name of public virtue that such functions be left where they belong, in the hands of "the people." It is so evident where the real benefits of such a step would go that we may fairly expect a delegation of sympathy from the benevolent and protective order of "White Caps." It can hardly be doubted that the Mormon Church would in like manner prefer that the reprehension of offenses against monogamy be and remain the exclusive privilege of "the people," and that their right be no longer infringed by that small body known as Congress. Absolute freedom of contract, as a reserved right of "the people," will be as agreeable to the bucket-shop and the pool-seller; while he who maintains his claim by virtue of his bowie and revolver will insist savagely upon the right of "the people" to the public domain. The fields in which it is to the decided interest of some small class that some privilege be left to "the people" are almost innumerable; and if they have not yet been fully exploited, it is because of moral objections, not because the political use of the term has any logical superiority. American politicians are by no means a criminal class, however much they have been abused. It is their own fault if they expose themselves to comparison with the desires of the criminal classes by persistence in the use of such a question-begging phrase as this one of "the people."

Loyalty in Employment.

THE breaking out of the Civil War in 1861, with its addition of a very large volunteer force to the little regular army, and a proportional increase in the number of officers, brought with it, on the part of many of the regular officers, a strong dislike for their volunteer colleagues. The objections to the new-comers were grounded not so much on their inevitable ignorance of military drill, or lack of readiness to meet constantly recurring emergencies, or on any of the other points which commonly go to mark rawness in the soldier, but rather on that more indefinite defect summed up as ignorance of the traditions of the service. It cannot be doubted that the defect existed and was a grave one. It led some of the new officers into acts, quite innocent in intention, whose detrimental consequences those who did them could neither foresee nor recognize.

The mistake, on the other hand, which so many of the less able regular officers made was in imagining that this defect in volunteer officers was permanent and incurable. To carry the feeling to the extent of

looking upon Terry and Garfield, and the uncounted multitude of gallant and high-spirited men whom such generals fairly represented; as being "only volunteer officers," in just the same sense in 1865 as in 1861, was flatly ridiculous and the spawn of professional conceit. While such men were volunteer officers, and were proud of it, it was in a higher sense than in 1861. The traditions of the service had been ingrained into them quite as well by a four years' course of warfare on a grand scale as by a four years' course at West Point and half a dozen Indian campaigns.

It begins to look as if the state of affairs in our industrial world, which for some years looked so gloomy and seemed to many observers to portend the approach of a socialistic régime of some sort, had been after all a parallel to our Civil War experience. Our railway system may serve as an example. Its unhealthy expansion through the years 1865-1873 is a familiar fact. Checked during the next half-dozen years of universal depression, it then began again more furiously than before, until it seemed as if the country were to be grid-ironed with railroads. Something more than wood and iron, however, is necessary for a railroad system. Hitherto railroads had generally trained their own men; and the "traditions of the service" touching the behavior of the companies to the men, and of the men to the companies, were well defined and still retained some expiring trace of the patriarchal features of medieval employment. There are some reasons for believing that this was not quite an ideal system; but our part of the world was used to it and was prepared to feel its loss severely.

It was inevitable that the loss should come under the new conditions. The railroad system in its sudden expansion could no longer keep its supply of men equal to the demand; and the consequent increase of wages became a constant force to draw men from other employments into "railroading." The new men thus entered a service to all whose traditions they were alien; and in their case the occasional friction of feeling or of interest which is unavoidable in any business union of human beings could not but show unaccustomed effects. Changes which to an old employee, with long experience to guide him, were only some of the common ups and downs of the service, seemed to the new men patent evidence of conspiracy against the workman's interests and rights. A brusqueness of manner in a superior, the result of a preoccupation and absorption in work which was easily understood and allowed for by the old hand, was to the new man merely an arbitrary and insolent indifference to anything but the interests of the domineering corporation. Those who were most apt to float into the direction of affairs in the labor organizations, too, were such of the new men as felt these suspected injuries and indignities most keenly, for the old hands had no such impelling motive to seek the lead. It was hardly possible that negotiations between such leaders and the corporation managers, thus called upon to deal, as to grievances which they believed to be mainly imaginary, with men who must have seemed to them mere interlopers, should have resulted other wise than disastrously. If a frigate's crew were constituted into a labor organization, the able-bodied seamen supplemented by an unusual number of landsmen unfamiliar with everything on board ship, and a martinet captain called upon to carry dis-

cipline into effect by constant negotiations with the representatives of a majority vote, the conditions could hardly have been worse than on some of our railways.¹

It is not only in the various modes of transportation that indications of such a period of transition are visible. The steady decrease in freight rates, giving capable employers a wider market and bringing local employers into contact with more and abler competitors than they had known before, has made the "pace" in manufacturing so fast that it can be endured in the long run only by those who are able to manage very large establishments, supply very wide markets, and make profits from many sales at low prices, rather than from a few sales at high prices. All these conditions have brought temptations and opportunities for discord parallel with those offered in transportation, and they have had much the same results. These results have had their good side. The patriarchal features of employment have gone; and, picturesque as they were, it is more than probable that the industrial world will be the better for their absence. The workman will no longer be either child or ward, to be cared for and coerced for his own good, but a man with all a man's rights and responsibilities. But the change will for a long time bring its own embarrassments.

It must be, however, that as managers and men become more accustomed to the wider fields, new conditions will bring their own traditions. Some railroads have never lost or even suspended them, for they have progressively accommodated their system to the changing conditions around it. They have still trained their own men and trusted them; and strikes and lockouts have been alike unknown. But their generosity in anticipating and providing for the material needs of their men now comes not as a charity, but as a recognition of the men's share in making the company's prosperity. Other forms of industry have brought employer and employee closer together by the various types of profit-sharing.

Is there not fair reason to hope that these are the coming forms of employment? That loyalty in employment is not dead, but is rising to higher and better forms? That it is no longer to be the mere loyalty of the employee to the employer who provides for and protects him, but the mutual loyalty of employer and employee—their common adherence to the high standards set by the traditions of the service? And that the troubles of the past few years have been but one phase of industrial progress, a step towards a better and fairer conjunction of labor and capital?

OPEN LETTERS.

Judge Holt and the Lincoln Conspirators.

IN the "New York Tribune" of September 2, 1873, there appeared an anonymous communication, written from Washington under the signature of "Truth," so grossly calumnious of General Joseph Holt, Judge Advocate General in the trial of the assassins of President Lincoln, that he demanded the name of the author, who proved to be John T. Ford, of Ford's Theater, where the fearful tragedy was enacted, and who, at the time, was committed to the Carroll Prison, where he was kept—on suspicion, it is presumed—over a month, when he was liberated without being brought to trial. Naturally enough, perhaps, he harbored a strong prejudice against General Holt, and sought to defame his character under cover through the press. Among other things he accused General Holt with having kept Mrs. Surratt "heavily manacled during her trial, and also of virtually depriving her of reputable counsel"—referring to the Hon. Reverdy Johnson, who, as clearly appears by his argument, which was upon the question of jurisdiction, voluntarily withdrew, leaving the case in the hands of his associate counsel, Messrs. Clappitt and Aiken. General Holt met the other charge by a letter, addressed to him, under date of September 4, 1873, from General J. F. Hartranft, who, referring to Ford's article in the "Tribune," said:

I think it proper, in justice to you, to declare publicly that its statements, so far as they relate to occurrences within my own observation, are absolute falsehoods. As marshal of the court before whom the conspirators were tried, I had charge of Mrs. Surratt before, during, and after the time of her trial, in all a period of about two months, during which she never had a manacle or manacles on either hands or feet; and the thought of manacling her

was not, to my knowledge, ever entertained by any one in authority.

One would suppose that proof so conclusive ought to set forever at rest the "manacle" charge; and as regards the reference to Reverdy Johnson, it is plain beyond doubt that "had he desired to continue in the case, assuredly there was no power that could have prevented him from doing so."

Yet, notwithstanding this and the overwhelming testimony on the other more serious and wanton charge against General Holt of withholding from President Johnson the recommendation of five members of the court that the sentence of Mrs. Surratt be commuted to imprisonment in the penitentiary, John T. Ford appears again in the "North American Review" for April, 1889, in an article reiterating the falsehoods of his anonymous communication, and trying to show that General Holt was guilty of withholding from President Johnson the aforesaid recommendation of Mrs. Surratt to mercy.

Now, in as brief a manner as possible, I will recite some of the stronger evidence, clearly proving the falsity of this last charge, made first before President Johnson's term expired, and afterwards by Johnson himself, when he was seeking "to curry favor with the South in the hope of being elected to the presidency." He did not dare to make the charge while he was at the head of the Government, because he knew if he did that General Holt would instantly demand, as he did ask for, in 1866, a court of inquiry, which the President declined to order, and that all the facts and circumstances of the case would come out. General Holt, I think, took little, if any, public notice of this slander until he found it had received the indorsement for railroad labor," due to "the larger proportionate amount of local traffic under the operation of the Inter-State Commerce Act," or, more commonly, to unhealthy competition and abnormally low freight rates. ("Quarterly Journal of Economics," January, 1889, pp. 174, 175.)

¹ Professor Hadley attributes a recent increase in railway accidents to this employment of new men, citing in evidence the fact that "in the majority of detailed railroad reports we find some allusion to increased wages as an important element in expense." He attributes it, however, to "the special demand

of ex-President Johnson, when in a communication, published in the "Washington Daily Chronicle" of August 26, 1873, he produced the most incontrovertible proof that "President Johnson had knowledge of, considered, and commented on the recommendation of Mrs. Surratt to clemency by members of the court before her execution." It had been publicly asserted that President Johnson approved the findings of the court "without having seen the recommendation or known of its existence," although it was known, of course, to every member of the court, and it was also made known to Secretary Stanton, both by General Holt and by Judge Bingham, one of the special judge-advocates in the trial, immediately after the close of the trial. In his answer to General Holt (see "Washington Daily Chronicle" of November 12, 1873) Mr. Johnson undertakes to support his assertion that he never saw that recommendation by showing that it was omitted in Pittman's authorized publication of the proceedings of the trial. But this omission was fully explained. It arose simply from the fact, as stated by Col. H. L. Burnett, special judge-advocate, who superintended the publication, that "the recommendation to mercy constituted properly no part of the record of the trial," and was not therefore furnished by him to Pittman for his book. In a letter of December 22, 1873, to General Holt (see "Washington Daily Chronicle," December 1, 1873) Mr. Pittman also says, "The recommendation in favor of Mrs. Surratt was not inserted in my book for the reason that it formed no part of the proceedings of the trial; it was not mentioned at any open session."

Judge Bingham says:

Before the President had acted on the case I deemed it my duty to call the attention of Secretary Stanton to the petition for the commutation of sentence upon Mrs. Surratt, and did call his attention to it before the final action of the President. . . . After the execution I called upon Secretaries Stanton and Seward and asked if this petition had been presented to the President before the death sentence was by him approved, and was answered by each of those gentlemen that the petition was presented to the President and was duly considered by him and his advisers before the death sentence upon Mrs. Surratt was approved, and that the President and the Cabinet, upon such consideration, were a unit in denying the prayer of the petition; Mr. Seward and Mr. Stanton stating that they were present.

Attorney-General James Speed, in a letter to General Holt, March 30, 1873, says:

After the finding of the military commission that tried the assassins of Mr. Lincoln, and before their execution, I saw the record of the case in the President's office, and attached to it was a paper, signed by some of the members of the commission, recommending that the sentence against Mrs. Surratt be commuted to imprisonment for life; and, according to my memory, the recommendation was made because of her sex. I do not feel at liberty to speak of what was said in Cabinet meetings. In this I know I differ from other gentlemen, but feel constrained to follow my own sense of propriety.

James Harlan, Secretary of the Interior, states positively that "after the sentence and before the execution of Mrs. Surratt, I remember distinctly the discussion of the question of the commutation of the sentence of death pronounced on her by the court to imprisonment for life, had by members of the Cabinet, in the presence of President Johnson." He thinks there were only three or four members present, and when he entered the subject was under warm discussion. He

does not remember hearing read in Cabinet meeting any part of the record of the trial or the recommendation of clemency, but says he was "told that the whole case had been carefully examined by the Attorney-General and the Secretary of War," the two Cabinet officers more immediately concerned, officially, in the matter. At this period Mr. Harlan was the editor of the "Chronicle," and in reference to the recommendation to mercy he said, "Had such a paper been presented, it is, in our opinion, hardly probable that it would, under the circumstances, have induced him to interfere with the regular course of justice."

James M. Wright, at the time Chief Clerk of the Bureau of Military Justice, states that when President Johnson sent a messenger to General Holt requesting him to bring the papers before him for his action, the recommendation for mercy was among them, in plain sight, and that when the case came back through the Adjutant-General's office it remained attached to the other papers.

General R. D. Mussey, President Johnson's private secretary, says, "On the Wednesday evening previous to the execution (which was Friday, July 7, 1865) Mr. Johnson said to me that he was going to look over the findings of the court with Judge Holt, and should be busy and could see no one." Two or three hours afterwards, Mr. Johnson came out of the room where he had been in conference with General Holt and said to him (General Mussey) that "the papers had been looked over and a decision reached." General Mussey continues:

I am very confident, though not absolutely assured, that it was at this interview Mr. Johnson told me that the court had recommended Mrs. Surratt to mercy on the ground of her sex (and age, I believe). But I am certain he did so inform me about that time, and that he said he thought the grounds urged insufficient, and that he had refused to interfere; that if she was guilty at all, her sex did not make her any the less guilty; that he, about the time of her execution, justified it; that he told me that there had not been "women enough hanged in this war."

General James A. Ekin, one of the commissioners in the trial, relates, under date of August 26, 1867, a conversation he had with General Holt soon after the trial, in which he states that General Holt told him

that the entire case, including all papers, had been placed before the President, and that his particular attention had been directed to the recommendation of certain members for the commutation of the sentence of Mrs. Surratt; that the President had carefully scrutinized and fully considered the case, including the recommendation to mercy on behalf of Mrs. Surratt; but that he could not accede to or grant the petition, for the reason that there was no class in the South more violent in the expression and practice of treasonable sentiments than the rebel women, etc.

General H. L. Burnett, in an address before the Loyal Legion, New York, on the 3d of April, 1889, published in the "New York Tribune" of the next day, in giving an account of the trial and explaining why the recommendation for clemency to Mrs. Surratt did not appear in Pittman's book, said:

When I reached my office from the War Department on June 30, or possibly on the morning of July 1, I attached the petition for mercy to the findings and sentences, and at the end of them. I carried the findings and sentences, and the petition or recommendation, and delivered them to the Judge Advocate General in person; and I never saw the record again until many years after, I think in 1873 or 1874. After Judge Holt's interview with the President, on July 5, the former came to Mr. Stanton's office in the War Department. I was with Mr.

Stanton when Judge Holt came in. He said, "I have just come from a conference with the President over the proceedings of the military commission." "Well," asked Mr. Stanton, "what has he done?" "He has approved the findings and sentence of the court," replied Judge Holt. "What did he say about the recommendation to mercy of Mrs. Surratt?" "He said that she must be punished with the rest; that no reasons were given for his interposition by those asking for clemency in her case, except age and sex."

Now, is there a fair-minded person living who would require more or better proof than the recommendation for the commutation of the sentence of Mrs. Surratt to imprisonment for life was in President Johnson's office, and that the question was fully considered by him in conference with several, if not with all, of the members of his Cabinet before the day of execution? True, no one states that he actually saw it in the President's hands, though Judge Bingham says both Secretaries Stanton and Seward told him it was presented to him and duly considered before the death sentence was approved. But Attorney-General Speed, a direct eyewitness, could, had he chosen to speak, have made this fact certain beyond doubt or cavil. Mr. Ford professes amazement at General Holt's anxiety for more detailed testimony from Mr. Speed, as indicated by their correspondence on the subject in the "North American Review" for July, 1888. I am myself free to confess that I do not think any additional proof whatever is at all necessary for General Holt's complete vindication; but Mr. Speed had been a lifelong friend of his, and knowing that he saw the aforesaid recommendation in the President's own hands, is it strange he should insist that he should tell him so? He may be, and is, I think, over-sensitive. In his preface to Pittman's book of the trial, Major Ben: Perley Poore, who unwittingly repeats the false newspaper manacle story, observes, "General Holt is an inflexibly upright administrator of justice, yet humanities have a large place in his heart"; and General Mussey, speaking of the call made by General Holt at the White House on the morning of the execution, when Miss Surratt was there and the President had refused to see her or any one in her mother's behalf,—overruling, also, at the same time, Judge Wylie's writ of habeas corpus,—says, "I shall never lose the impression made upon me of your [General Holt's] deep pity for her [Miss Surratt] and of the pain which her distress caused you." But will Mr. Ford or any other of General Holt's persistent calumniators be so kind as to state why General Holt should have been so anxious for Mr. Speed to tell the whole truth, had he not known, beyond the remotest question, that it would have been conclusive testimony in his favor? Would he have asked Mr. Speed to say more than he did say, if he had had the least doubt on that point? Surely not.

It is not the purpose of this article to go into the evidence regarding either Mrs. Surratt's guilt or innocence; but I cannot refrain from brief comment on the following quotation from Mr. Ford's article, wherein, referring to Mrs. Surratt, he says:

The very man of God who shrived her soul for eternity was said to be constrained to promise that she should not communicate with the world. As the poor martyr walked in her shroud to the scaffold, it is also said that she begged the priest by her side to let her tell the people "she was innocent." She was told that "the Church was permitted only to prepare her soul for eternity; that already she was dead to all else."

This looks strangely, to say the least; and I am reminded by it that it was just this which the late John M. Brodhead, Second Comptroller of the Treasury, once told me was, in his view, conclusive proof of Mrs. Surratt's guilt. He believed that had not the priest known from her confession that she was guilty, he would never have prohibited her from declaring her innocence, but would himself have insisted on it to the last moment. One thing is certain, there was no man living who more firmly believed in her guilty participation in the assassination of Abraham Lincoln than President Johnson, who, in commenting on the appeals made to him for clemency, said at the time to Rev. J. George Butler of St. Paul's Church, Washington, that "he could not be moved; for, in his own significant language, '*Mrs. Surratt kept the nest that hatched the egg.*'"

I have observed that General Holt at one time asked for a court of inquiry. It was in September, 1866. In his answer, November 14, 1866, Edwin M. Stanton, Secretary of War, wrote to "Brevet Major-General Holt, Judge Advocate General," as follows:

Your letter of the 11th of September applying for a court of inquiry upon certain imputations therein mentioned as made against you, of official misconduct in relation to the prosecution of Mrs. Surratt and others charged with the assassination of the late President, Abraham Lincoln, and in the preparation of testimony against Jefferson Davis and others, charged with complicity in said crime, has been submitted to the President (Johnson), who deems it unnecessary for your vindication to order a court of inquiry.

In communicating the President's decision, it is proper for me to express my own conviction that all charges and imputations against your official conduct are, in my judgment, groundless. So far as I have any knowledge or information, your official duties as judge advocate general, in the cases referred to, and in all others, have been performed fairly, justly, and with distinguished ability, integrity, and patriotism, and in strict conformity with the requirements of your high office and the obligations of an officer and a gentleman.

WASHINGTON, D. C.

Horatio King.

Boston Corbett.

THE authors of the "Life of Lincoln," in their description of the pursuit of Booth and his death in Garrett's barn, say:

Booth, who was clearly visible by the flames through the cracks in the building, was shot by Boston Corbett, a sergeant of cavalry, a soldier of a gloomy and fanatical disposition, which afterwards developed into insanity.

I was a member of the 16th New York Cavalry, and well acquainted with Corbett, and I feel a grave injustice is done him in the above description of his disposition. He was intensely religious, and was actuated by his convictions of duty under all circumstances. This frequently drew upon him the jeers and insults of the coarser and more reckless spirits of the regiment, but their persecution never deterred him from doing what he conceived to be his duty. If this was being a gloomy fanatic then he was one, but in no other sense.

My recollection of him—and we soldiers learned to know one another as we roughed it together on picket and on scout—is the very opposite to this. I have never known a person so cheerful and heroic under circumstances of intense suffering and great provocation. His example has been a source of inspiration to me through all the years since last we parted. I well remember he allowed himself to be reduced to the ranks and suffer a humiliating and cruel punishment

rather than withdraw a charge, which he believed to be true, that he had made against an officer. He was actuated by his convictions then, and I believe he was inspired by the same high motive when he fired the shot that slew the assassin of Lincoln. He believed it was better to disable Booth — for that was his intention — than to permit him to shoot Lieutenant Doherty, which evidently in another moment he would have done.

I have read with intense and ever-increasing interest the "Life of Abraham Lincoln," and as it is destined to become a classic and make history, even the most humble individual who appears in its pages should have dealt out to him a full meed of justice. I am sure no persons have a more earnest desire for this than the authors.

*Austin Potter,
Late Sergeant Co. G, 16th N. Y. Cavalry.*

METHODIST PARSONAGE, DUNGANNON, ONTARIO.

An Anecdote of the Blairs.

MR. FRANCIS P. BLAIR, SR., already a prominent figure in national history in the days of Andrew Jackson, was the father of Montgomery Blair in the Cabinet of Mr. Lincoln, of Frank P. Blair, Jr., a major-general in the Union army and the commander of a corps of Sherman's forces in his famous march from Atlanta to the sea, and father-in-law of S. P. Lee, an admiral in the United States navy.

It was the daily habit of Mr. and Mrs. Blair, each of them then approaching their eightieth year, to ride around the country, along the byways, and off the public roads. This couple were known by all the country folks for miles away from their home, which was at Silver Spring, the famous and historic spot where the destiny of so many men in public life was fixed or changed. The roads leading into the city of Washington were well guarded; so well, that the pickets were very near each other. These pickets were changed every day, and of course the guards who saw this couple ride one day and who had become acquainted with them would be displaced on the morrow and new men would take their places. It so happened that Mr. Blair had adopted the idea of wearing a short green veil over and around his high hat, so as to shade his eyes in the strong sunlight which was reflected from the sandy roads under a summer sun. For the same reason, Mrs. Blair wore a bonnet coming far over her face and hiding her features. In this odd and unique style of dress they roamed and rode at will, far and near, as they had both been accustomed to do for a quarter of a century preceding.

It so chanced that one picket, who happened to be on duty a number of times at different places, was struck with the queer appearance of the couple, which did not at all comport with the fine-blooded horses they rode,¹ and becoming gravely suspicious, he determined to report them at headquarters as worthy of being looked after. This done, the order went out the next day that this was a case to be carefully examined, as many spies were known to be prowling about in search for news to be sent across the lines to the enemy. A sagacious and faithful man was specially detailed on a certain day to guard a particular road which it was

known the "suspects" must take on their return across the country. When the suspicious couple at length came in sight of this picket, after the order "Halt!" had been given, the usual questions were put, as follows: "Where are you from?" "Where are you going?" "Have you anything contraband about you?" etc. All these inquiries being responded to in a satisfactory way the picket then broke out abruptly with other questions not on the regular list, and began thus, "Well, who are you, anyway?" The old gentleman, who up to this time had done all the talking on his side and had responded to all inquiries, and who had much quiet humor in him, turned to his wife with the remark, "Betty, who are we?" With a smile the old lady turned to the picket and replied, "Well, guard, what would you think if I said we had a son who is a Cabinet minister, and another son who is a major-general, and another son who —" The guard, not waiting for any more, quickly interrupted with the retort, "And I suppose you will say another son who is an admiral!" "Yes," responded the old lady, "an admiral, also." "Well, now, old woman, that is coming it a little too strong. If you had left out the admiral, I might have believed you; but as it is, I think you are both subjects for the headquarters; and so come along." There was no course but submission, and the three rode along some distance, the prisoners in front of their captor, and all the way the latter kept a watchful eye upon the supposed spies.

At length a group of officers approached, each making a salute and halting to speak to the captured rebels. "Why," said one of these officers to Mr. Blair, "what does this mean? You in the hands of a military guard? One might suppose you were prisoners and on your way to headquarters." "Well," said Mr. Blair, "so we are." The officer, quickly turning to the soldier, demanded to know what he had been doing. Much abashed and crestfallen, he explained to his commander in an undertone, "Well, sir, when I questioned the old man I believed him to be all right; but when the old woman told her darned story about her having one son in the Cabinet, and one son a major-general, and then on top of that added another son an admiral, I thought she was yarning, and I would not believe anything but that they were real spies, and I arrested them on the spot."

I tell the story as it was told to me by Mr. Blair himself immediately after the incident.

Eliza Clagett Allen.

NEW YORK CITY.

"The White League of New Orleans."

A LETTER has been received by the editor from Mr. F. R. Southmayd, formerly of New Orleans but now residing in Chicago, in which he refers to Mr. Cable's story, "The Haunted House in Royal Street," published in *THE CENTURY* for August, 1889. He denies that the White League ever had a badge of any kind. He also says that it "was not the organization of a political party"; also that the purpose of the White League, as declared in the second article of its constitution, was to "support the constitutions of the United States and of the State of Louisiana, and to

his renowned raid around Lee's army and afterwards presented by him to General Frank P. Blair, Jr., who gave it to his aged mother.

¹ Mrs. Blair, who was a superb equestrian even up to the year of her death, at this time was riding "Black Sluggard," the war-charger used by Major-General George A. Stoneman in

maintain and defend the rights of citizens thereunder." Mr. Southmayd also states that the "charge has been designedly and industriously circulated that the White League was organized against the black race." He thinks the connection in which Mr. Cable makes mention of the badge of the League simply confirms this false charge in the minds of those who had already heard it, and gives a false impression to those who had not heard of the White League before. He declares that "not a black man was harmed in New Orleans under the authority or by orders of the White League while it was in armed possession of the city."

A Reply.

I AM not aware that any one has called the White League "the organization of a political party." I certainly have not. My statement was, and is, that "In the 'Conservative' party there sprung up the 'White League.'" A "Radical" attempting to join it would have been counted a traitor by his own party, or else a spy by the League.

It was common in those days for young men of New Orleans to wear a small buttonhole-bow of narrow, black-velvet ribbon with a dotting of white silk on both edges, and White Leaguers — my personal friends and acquaintances belonged to the League by scores and hundreds — told me it was a badge of the League. It may have been entirely unofficial, or may have belonged to only one or a few companies. The eye-witness from whom I have the facts of the Royal-street High School evictions may have seen this, or may have entirely mistaken the purpose of the White Leaguer's gesture. Whether the League officially adopted a badge or not seems to me a very trivial point. What potential fact does it discredit?

Mr. Southmayd quotes the text of the second article

of the League's constitution. But I submit that when the League, with foot, horse, and artillery, routed in bloody battle the whole force of the *city police*, it did not stick to its text. If its text had been slightly richer — if the declared purpose had read, "to support the constitutions (Federal and State), and to maintain and defend the *equal legal* rights of *all* citizens thereunder," there need never have been a shot fired, nor an eviction of a single High School girl from the already sufficiently "haunted" house in Royal street.

"Not a black man was harmed"? If mere bodily harm is meant, I eagerly credit the assertion. But there are harms deeper and far more lasting than bodily injuries, and I say there was not a black man in the State — no, nor a white man, badged or unbadged — who was not, and does not remain to this day, harmed by the whole policy and action of the White League. This is only a deep conviction. History will decide whether or not it is well founded.

G. W. Cable.

Congo.

MR. HERBERT PROBERT, author of "Life and Scenes in Congo," writes, in relation to Mr. Tisdell's article in the February CENTURY, that Pallaballa does not contain five hundred people. He adds that there is a large and flourishing Baptist mission about one hundred and fifty yards from Pallaballa, and that there are missions at Banza Manteka, Lukunga, and Leopoldville. Mr. Probert thinks more highly of the intelligence of the natives than does Mr. Tisdell. He says: "Several natives of Congo are now in Shaw University. Their progress in various branches of study is most commendable. Some of our converts at Pallaballa speak fluently in English, Portuguese, and Kikongo."

BRIC-À-BRAC.

"I'LL HIT THAT RABBIT."

HIT!

Poems versus Peanuts.

MY love brings poems Thursday nights
And peanuts every Monday;
He writes from early morn till eve,
Except, of course, on Sunday.

He sings of sweetness long drawn out,
Of hopes cut through the middle,
And once he tried to weave in rhyme
The hoary Sphinx's riddle.

He's very gay, then taciturn,
And scathingly sardonic
When poetizing Plato's school —
(That's where we get "platonic").

For themes he scours the country through
From 'Cisco's bay to Fundy's,
But really, if the truth were told,
I'd rather see him Mondays.

De Witt C. Lockwood.

Whar dem Axes use to Ring.

T' AIN' no people at de quarters, whar dem quarters use
ter be,

De peckerwood doan' peck no mo' ergin de ellum tree,
De tater-bug jes res' hese'f 'pun top de tater-vine,
Un 'fo' de wah, de tater-bug ain' 'sturb nobordy mine.
De hade er evvy cullud man, un cullud 'oman too,
Is chock full up un jam up tight wid somp'n' dat is new.
De dorg dee call de possum dorg ain' nutt'in' but er fool.
It 'pear ter me dis country got de cyart befo' de mule.

De chillun doan' tote bread no mo', down ter de fur
low groun',

Dee 's ramblin' evvy whichever way ter cornder sto' un
roun',

De yaller man f'om up de Norf gie out he larnin' school,
When I was chillun dee l'arn me how ter drive de
yaller mule.

De parster fiel' is natly¹ un stark run med wid bresh,
De water gaps is dun bu's' out, un lef' in orl de fresh.
'Stidder de crap, 't is 'lection day un toonymment un thing,
Un dyah ain' no axes ringin' whar dem axes use ter
ring.

Ole Marster dade dis long time, we was one mont
chillun sho;

Turr year we burry Mistes whar de aldy blossom grow.
Brer Ephum gone, un Marshall whar drive de white
folks' kerrige;

Cow miner Joe he dade too, un Ben whar ten de
ferrige.

Hit 'pear leck somp'n' nurr done breck, de place dat
mons'us still,

Un de ole man mighty strusted when de damp come up
de hill,

But I 'd swap mer bigges' rooster, ef Christmus come
mout bring

De ringin' er dem axes whar dem axes use ter ring.

"Ailsy" — dat 's mer wife, sah; er good wife she was
ter me —

Had straight hyah, er fyah skin 'oman es ever you wish
ter see.

She nu's' de white folks' chillun, up at de gre't house
dyah,

Den dee lef' her dade in de mountains, at de Sulphur
Springs somewhar.

Does you 'member dem days, Marster? No, you worn'
sca'cely born.

No, sah, t' ain' no people at de quarters — Ailsy un all
is gone.

¹ Entirely.

Un some days when I horble out, down ter de parf-
side spring,

I listen un I listen, but dyah doan' no axes ring.

How ole is I? Hundred? Gord! I mo' un dat, I
boun';

I born de year de Gennerl 'storb Cunwallis at York-
town.

I was fetch up on Jeemeses River, 'long er yo' gran'pa
un ma

Den de army hit breck out, un come un bu'n de lan'
up fyah.

Un I 'se de larse er all dat 's lef', 'scusing 't is little Jim,
I 'low de place 'u'd be lonesommer, 'ceppin' 't was fer
him.

Un Marster, when de ole man gone, 'long 'bout de time
er spring,

When de reed-bud nissen in de ma'sh, un de robin 'gin
ter sing,

Mout I ax you fur ter res' him whar dem axes use ter
ring?

William Page Carter.

Leigh Hunt my Bird.²

I CALL my bird Leigh Hunt, because he sings

So cheerfully in prison. It is meet

That Poesy, to bear out the conceit,

Give him a garden. So I stick green things

About him boweringly. See how he swings

On yonder mimic bush, his pink-ribbed feet

Quivering beneath him with sensation sweet

Of new-found freedom, and his dainty wings —

Lo, how he spreads them fan-like in the sun! —

Seem like a patch of silken moonlight spun.

Leigh Hunt my Bird! look not beyond the stars

And pine to skim with larks the aerial blue:

Leigh Hunt the Poet made his prison-bars

A Paradise; and so will we make yours for you.

Leigh Hunt my Bird, he has a sunny soul,

And prone, I think, by nature to content,

What though the destinies have cruelly pent

Him thus within a little gilded hole.

Shall he for this espouse his tongue to dole,

And all his melody in wails be spent?

Yet sometimes I misdoubt this glad ostent

His heart is breaking, and mine own is full

With fellow-feeling: sometimes he grows sad,

And hangs his head, and when I say, "Sing sweet!"

Draws only from his breast a low "Tu-weet!"

Leigh Hunt my Bird, Leigh Hunt the Poet had

His love in prison with him; that is why

He never lonesome grew — as you and I.

Orelia Key Bell.

Aladdin.

His minions change green into gold,
They tint with crimson wood and wold;

They deck the forest in the sheen

Of dusky amber, and the green

Is made a carpet wide unrolled

Of leaves of purple, brown and gold!

He rubs his lamp, his minions fly

To do his bidding far and nigh.

He rules the world when Summer's lost,

Aladdin he — white-armored Frost!

Brainerd Prescott Emery.
